INTRODUCTION

The Promise and Vulnerability of Independent, Alternative, and Community Media

David W. Park and Meghan Grosse

When we think about "the media," we frequently imagine problems that we have with the media. Almost everyone is a critic of "the media." Independent, alternative, and community (IAC) media are different. There are defenses of and even manifestos on behalf of IAC media almost everywhere, and it is rare to encounter someone who speaks against the potential of IAC media. IAC media enjoy an unusually positive reputation in the hearts and minds of people across an eclectic array of political and social positions.

Free market libertarians see IAC media as essential components of a competitive marketplace where a multifarious range of options demonstrates how the lack of government interference can allow even smaller operations to become profitable, public-facing organs of culture and opinion. Here the libertarian ideal of multivocality—a thousand gardens blooming—is seen as the ideal means and ends for how media outlets fit into our lives. Picture a classic mid-twentieth-century newsstand, stocked with hundreds of different print publications from around the world, or imagine the World Wide Web itself, with its ponderously vast number of sites dedicated to all kinds of expression. These would be seen, in libertarian terms, as examples of a functioning free market in communication, a market that draws breath in large part from the vigor found in small media enterprises.

Conservatives who find the corporate media too "liberal" or "progressive" turn to IAC media as a way to get away from the mainstream media, who are held to be cozy with technocrats and other elites. Here the internet has received tremendous attention from conservatives,

CC BY-NC

and the World Wide Web's association with conservative causes around the world has given voice to a populist belief in how IAC media outlets put the power back in the hands of those who agree with conservative values, uncensored by any elites.

Marxists see IAC media as exemplars of how media labor can be reclaimed and put in the service of the people in the name of opposition and resistance. Here IAC media are understood largely in terms of that Marxian concern for labor, and even for non-alienated labor, as the ideal of IAC media becomes aligned with the grander project of countering the ideological tools of the bourgeoisie. The slogan telling us we should "become the media" aligns with this vision of how IAC media outlets should operate.

Those who believe that media play an essential role in the sustenance of democracy see IAC media outlets as crucial supports in a Habermasian vision of how opinion ought to be worked out through public communication. Provision for the maintenance of IAC media is seen as essential to the sustenance of democracy. IAC media are seen as something like carve-outs that make autonomous journalism and other public-minded culture possible. These are media outlets as a refuge from the more profit-driven big media corporations, whose profit-focused incentives turn them away from democratic goals and public service.

Activists and intellectuals who represent feminist, Black radical, Indigenous, working class, and other movements all make use of independent media outlets and make plain their belief in the necessity of media being in the hands of the people. IAC media operate here as repositories of hope and power, collecting resources for representation of worldviews frequently ignored by corporate media, countering their othering tendencies, and generating community through the distribution of messages that come from inside their own world.

Scholars around the world rely on publishers of books and journals so that they can share their work with each other and with the broader public. As the biggest academic publishers pursue an accelerated strategy of consolidation and market lock-in, installing their own vision of what is profitable as what will suffice for academe, many scholars find themselves turning to an academic version of IAC media in the hope of finding publishing venues that reflect scholars' own interests and that foster a more organic connection to academic work than can be found in working with the big publishers. [1]

Large, for-profit media corporations frequently regard IAC media as bearers of new possibility for their own operations, in the form of ideas to be co-opted or as properties to be acquired. With a prospector's gaze, these dominant media operations see promise not in IAC media in and of themselves, but in terms of what they might offer to their own future profitability, if the material could be "scaled" or distributed to a broad enough audience. It is a familiar narrative in media history, where a small media organization brings something new and dynamic—the next big thing—to light, and then gets absorbed into the dominant media.

This widespread agreement regarding the beneficence of IAC media is the result of an unusual alignment of different philosophical and political standpoints. The sentiment that brings them into alignment is a widespread agreement that large, corporate, mainstream media outlets are not doing things very well. This is of course a well-worn idea in media studies. If anything can be expected to generate widespread agreement among communication and media studies scholars, it would be the idea that the media—understood frequently

[1] We would be remiss if we did not point out that mediastudies.press—the press for this open reader—aligns with these values.

(and somewhat justifiably) to be a shorthand for large, corporate-controlled media operations—create problems. Independent, alternative, and community media become what we can salvage from the wreck of "the media."

IAC outlets occupy an unusual space in scholarship and pedagogy. Though there is certainly abundant scholarship concerning IAC media, these tend not to attract as much attention as the corporate alternative, in large part because they simply lack the power of large media entities. The decisive media operations and cultural phenomena whose actions are most noticeable and powerful—from Facebook to Disney to Beyoncé to federal regulatory boards—take up much of the space of media studies scholarship. This makes perfect sense, of course; media scholarship *ought* to address the most visible issues we face, and while some parts of the humanities struggle to explain why they focus so much on less prominent parts of the culture, for better or for worse, media studies has long been called to the more prosaic and powerful currents in media culture.

In the classroom, this focus on corporate media makes sense in much the same way. Students enroll in media studies courses, instructors teach them about something called "the media," and so our courses often follow the same cues that our scholarship does, with a focus placed largely on dominant media phenomena. One result is that many of the schools of thought that get regular treatment in media studies courses take on a critical cast; the media are posed mostly as a problem. Media studies courses become litanies of what has gone wrong with the media. Courses that focus on journalism detail the dysfunctions and problems in journalism, where we find a target-rich environment. Courses that focus on critical political economy are shot through with descriptions of large corporate entities exerting themselves against all comers. Cultural studies courses usually touch on the potential for oppositional views, but often make this case on a dreary-if-relevant backdrop of cultural domination. In short: For some very good reasons, media studies classes are often excursions in plumbing the dystopian possibilities of media systems and their effects on individuals and societies.

In light of this downcast tendency in media studies—a tendency that has arguably become even more pronounced in recent years, as authoritarianism's global spread becomes a direct challenge to the very idea of critical thinking—something that this open reader can do is provide material for courses that emphasize something more upbeat. The selections in this open reader do not treat IAC media as uniformly or perfectly good things, nor do we hope to uphold any such myth. Still, IAC media are largely focused on the kinds of hopes that we have about how we communicate with each other. The media considered here link up in direct and obvious ways with hopes for democracy, political progress, self-expression, community formation, conflict resolution, advocacy for neglected groups, mutual understanding, cultural innovation, group advocacy, group representation, and much more. A media studies curriculum ought to include the study of IAC media because they remind us that the media themselves are not just a problem, not just a monolithic agent of capitalist, misogynist, *(neo)* colonial domination.

One potential problem with a focus on smaller media outlets, many of them unknown to all but a few, is that these outlets will not be as familiar to students or their professors. So much the better. By considering termite media and not just white elephant media,[2] we get an

[2] See Manny Farber, "White Elephant Art vs. Termite Art," *Film Culture*, no. 26 (Winter 1962): 9–13.

opportunity for a ground-up perspective, one that reveals a more inspiring set of possibilities and potential than an exclusive focus on the dominant. The IAC perspective does not rid us of dilemmas—indeed the dilemmas run fast and deep in the world of IAC media—but even these dilemmas give us a different perspective for understanding than we would have if our attention remained fixed on dominant media.

Because definitions of IAC media involve perilous slippage, many points of disagreement, and a challenging variety of theoretical emphases, it would be worthwhile to consider in some detail how scholars have defined what we have called—in a nod to that diversity—independent, alternative, and community media. Our goal in this definitional survey is not to arrive at precise or correct definitions, but to establish some of the theoretical parameters at work in the scholarship. The scholarly conversation about IAC media has been going on for a long time in a wide variety of contexts, and there is as much to be gained from noticing the differences and points of contention as there is in noticing the significant points of overlap. For the purposes of this reader, we take IAC media to be part of an ongoing conversation. This conversation involves certain ways of looking at the media, and cues particular problematics and potentials of IAC outlets. Because our goals are broad and pedagogical, and because we are charting an expansive global conversation, we do not offer a specific definition of IAC media. Instead, we review definitions of independent, alternative, and community media expressed in the literature. One can find common themes across all of these definitions, while noting the conceptual fault lines too.

Independent Media

One quickly finds the phenomenon of "independent media" to be a multi-dimensional affair. James Bennett helpfully identifies how media "independence may be present, or contested, at one or all of" four sites. The first of these is the sociopolitical, where status as independent media is taken to refer to a certain independence from governments and to the need for voices independent from those governments to play a role in self-government.[3] The second site is the industrial, where independent media are understood to operate "with 'freedom,' from (excessive) state regulation or commercial imperatives" and from "(in reality or rhetorically) the mainstream."[4] The third site is the formal, "whereby independent media produce and mobilize an ensemble of particular aesthetic and taste codes." Many of these codes are difficult to navigate without the requisite cultural capital, so we find talk of media independence lending itself to "niche and elite tastes." The fourth and final site Bennett identifies is the "rhetorical or discursive," which "operates across the other three sites and is mobilized by producers, audiences, regulators, businesses and a range of vested interests in declaring this or that formation to be 'independent media.'" Here the very idea of media independence, a complex and weighted rhetorical construct, is the thing at play, and we often find this ideal

[3] James Bennett, "Introduction: The Utopia of Independent Media: Independence, Working with Freedom and Working for Free," in *Media Independence: Working with Freedom or Working for Free?*, ed. James Bennett and Niki Strange (Routledge, 2015), 3.

[4] Bennett, "The Utopia of Independent Media," 3–4.

of media independence "expressed as a utopian ideal within which a particular 'independent media' might operate—for example, the free press, or 'Indie' music or film." [5]

The sociopolitical site of independent media frequently finds purchase in considerations of independent media that emphasize outlets' functional independence from governments. We often find this usage of the term "independent media" [6] in parts of the world where governments play a prominent and direct role in shaping communication. James Zaffiro uses this term to explain broadcasting reform in Botswana, [7] and Mercy Wambui describes how "independent media" are a response to an "urgent need to move from top-down, state-driven propaganda to message-driven and participatory forms of dialogue and expression." [8] Jenifer Whitten-Woodring uses "free media" and "independent media" interchangeably, as a way to consider "media free of legal restriction, free of censorship or intimidation/violence, free from financial limitations by government, and encouraging plurality of ownership, monitoring function of journalists, coverage of controversy, and work on behalf of/representing marginalized voices." [9] Peter Eng relays how journalists working for independent media outlets had begun "enlarging the political space in Southeast Asia, a space that has been dominated by authoritarian governments." [10] And Oray Egin employs this same familiar formulation to describe Turkey's prime minister Recep Tayyip Erdogan's attack on independent media. [11] The opposition in this understanding of independent media is rather stark: Good independent media are treated as the cure to bad government-run media.

When searching for non-scholarly sources related to "independent media," we found numerous articles that incorporated this independence-from-the-state understanding. This view is particularly common in Western journalism articles concerning news reporting outside of the US and Western Europe. This definition of independent media—especially independent journalism—as hinging on freedom from state control poses a problem. The presumption that independence from the state makes media outlets meaningfully independent can be criticized as a rather shortsighted and US-centered vision. In his treatment of Brazilian journalism, Afonso de Albuquerque connects this concern for independence from the state to what he calls "US/UK Fourth Estate models of journalism." [12] Albuquerque traces how the very idea of "independent journalism" in Brazil came to be coopted by a neoliberal understanding of commercial journalism as meaningfully independent simply because it was not controlled by the government. When the sociopolitical site of independence is identified as non-state-run media, we find the idea of independence itself doing work to elide or conceal corporate control.

---

[5] Bennett, 4.

[6] In this context, the term "independent journalism" is often used instead of "independent media."

While the sociopolitical site of independent media tends to be focused on particular political contexts, the industrial site of independent media is more widespread. Michael Azzerad points to the "punk ethos of DIY, or do-it-yourself" that characterizes independent rock music.[13] Independent film, likewise, has been defined in terms of the "financing, production and artistic intent" that defines filmmaking that "exists in between avant-garde and experimental films," on the one hand, "and studio-financed Hollywood production," on the other.[14] Yannis Tzioumakis acknowledges, and then critiques, the idea that "independent filmmaking consists of the low-budget projects of (mostly) young filmmakers with a strong personal vision," quite distinct from the big-budget Hollywood-style filmmaking.[15] Industrial location also plays a major role in how Geoff King defines independent filmmaking; he describes how many independent films are "produced in an ultra-low-budget world a million miles from that of a Hollywood blockbuster."[16]

The same industrial approach to defining independent media can be found in the worlds of comic books and video games. Gamal Hennessy defines "independent comic book publishing" as something done "without the support or assistance from any larger corporate owner or third party publisher," which he connects to "creator-driven comic book publishing" and "freelance comic book publishing."[17] In the world of video games, Paulo Ruffino outlines the broadly-shared understanding that "independent video games were made by individuals or small companies, with limited budgets, and distributed privately or via online platforms bypassing traditional publishers," an understanding that Ruffino finds disappointing given that it is unclear how this movement's "new modalities of production" represented any meaningful emancipation.[18] Nick Dyer-Witheford and Greig de Peuter find independent video game development to be swamped in a market where the video game publishers have inordinate power,[19] a situation they situate in terms of Vincent Mosco's description of how independent operators in media "absorb high product risks and labor costs for the giants, which maintain control over the critical areas of finance and distribution."[20]

The third site of independence that Bennett applies is the formal. Here the distinctions tend to be more implicit than in the first two sites (sociopolitical and industrial). We find numerous discussions pertaining to how independent media come to be identified in terms of their formal distinction from the content offered by large media corporations. Ryan Hibbett "draws a parallel between indie rock and high art, both of which depend upon a lack of popularity for their value, and require specialized knowledge to be fully appreciated."[21]

Independent filmmakers, he adds, are those who "create films that stand against the crass commercialism of mainstream Hollywood while often pushing the envelope in terms of subject matters and representation."[22] Independence can be lined up with the "formal/aesthetic strategies" of independent films, wherein these films "adopt formal strategies that disrupt or abandon the smoothly flowing conventions associated with the mainstream Hollywood style" and "offer challenging perspectives on social issues."[23] Something similar can be said about the "distinctive aesthetic traits" of independent games.[24]

The fourth and final site of media independence, the rhetorical or discursive, reminds us that "independence" is a stake in the game, a site to be claimed. Here there is a more pronounced awareness that media independence is put forward as a premise in some argument on behalf of independent media. "Independent film" is a label that comes to be attached even to films produced by major corporations.[25] Alisa Perren describes how "indie film" became a convenient marketing label to brand a particular type of movie for Hollywood studios looking to extend their reach into certain markets.[26] Independent rock music, likewise, can be seen as "a marketing tool."[27] It is the "relationship to the broader social, cultural or ideological landscape" that subtends the "independent" identity of independent films.[28] The rhetorical or discursive site demands an appreciation of the contradictions of media independence, the impossibility of truly nailing down what independence must always mean. These contradictions are indexed by the sheer difficulty in settling on a "fixed definition of independence"; definitions of independence range widely "across various actors involved and their temporary and fluctuating interpretations of their own work" in indie games.[29] Laine Nooney addresses how "indie" comes to serve as "a referent for a curious balancing act between art and business, commerce and creativity." This balancing act generates a host of rhetorical strategies of independence, poised as it is among "varied aesthetic imperatives about the contours of 'personal expression,' a kind of neoliberal hucksterism around the power of individual creativity, and the endlessly scalable conditions which drive our creative desires."[30] At the rhetorical and discursive site of media independence, we are reminded that there is no essential "independence" that operates autonomously in any particular media context, to be measured with scientific precision. Media independence is always already a claim.

Alternative Media

Media deemed to be "alternative" encounter issues that run parallel to the "independent" designation. Certainly, as with "independent" media, there are nagging concerns rooted in

demarcation. John Downing decries the term "alternative media" as being "almost oxymoronic" because "everything, at some point, is alternative to something else."[31] It is important, he adds, that we not "idealize alternative media as 'free spaces' that are completely liberated from the day-to-day structural considerations" at work in almost any media operation.[32] Alternative media are often run with commercial constraints in mind, which may make them more like dominant media operations than we might prefer. Linda Jean Kenix notes that "commercially minded alternative media are naturally cognisant of economic pressures and fiscally plan their operations in such a way to (hopefully) ensure their own continued existence—even if the chance of economic sustainability is quite small."[33] As with "independent media," we find ourselves on conceptual terrain where distinctions cannot be taken for granted.

A common issue at work in alternative media definitions concerns their contribution to a broadened and more multivocal media sphere. The common view is that alternative outlets are more inclusive, with a wider range of points of view. The focus on multiplicity can be found in Chris Atton's argument that alternative media "are not simply concerned with presenting a different version of the world; taken together, they offer *multiple* versions of the world."[34] As a rubric, "alternative media" becomes a rather content-neutral way to refer to the range of possibilities for expression. As media that are more easily accessed by creators, alternative media benefit from what Mike Mowbray calls "logics of participation,"[35] wherein accessibility involves "offering broad-based, direct participation in media production, especially to those least well represented in mainstream media and the discourse of dominant publics."[36] James Hamilton argues that the "collective value" of alternative media can be found in "their exploration of new forms of organizing more participatory techniques of media and more inclusive, democratic forms of communication."[37] Alternative media are, then, widely viewed as an important part of what makes a broader cultural conversation possible.

Connected to this idea is a slightly more dynamic appreciation of how alternative media stimulate innovation and "the new," particularly in the context of art.[38] So one can find descriptions of the "heterodox-creative logics" of alternative media, which are "exemplified in a concern with the production of 'culturally radical' content and aesthetic innovations."[39] Though there is reason for skepticism about a connection between innovative aesthetic com-

[38] Understood this way, art is nothing but a set of media relations. There is an obvious way in which this is true. The term "media" is found quietly at operation in almost all discussion of art, and art departments at colleges and universities are almost always divided according to media (e.g., painting, printmaking, sculpture, photography, and of course "mixed media"). In a less obvious manner, art involves the same structures that other media do. Art galleries and museums are media outlets much like other media outlets, and must be sustained and imagined like other media outlets.

[39] Mowbray, "Alternative Logics?," 27.

munication and meaningful political liberation, it is still worthwhile to appreciate how artistic innovation across all media—from painting to motion pictures to music—depends to a great extent on how those media systems are imagined and structurally arranged.

Alternative media can be defined in terms of how they stand in opposition to dominant media and cultural formations. Here, beyond giving us new voices or a broadened sense of what exists, alternative media come to be associated with, and valued for, their alignment with that which cuts against the dominant way of doing, thinking, or feeling. There is a kind of dialectical appreciation of how alternative media stand opposed to what is dominant. Nick Couldry and James Curran make this an explicit definitional criterion for alternative media when they declare that "what we mean by 'alternative media'" is "media production that challenges, at least implicitly, actual concentrations of media power, whatever form those concentrations may take in different locations."[40] As he lays out the rationale for considering an alternative internet, Chris Atton defines alternative media as "a range of media projects, interventions and networks that work against, or seek to develop different forms of, the dominant, expected (and broadly accepted) ways of 'doing' media."[41] John Downing's description is quite similar to this, with his notion that alternative media "generally serve two overriding purposes: (a) to express opposition vertically from subordinate quarters directly at the power structure and against its behavior; (b) to build support, solidarity and networking laterally against policies or even against the very survival of the power structure."[42] Robert Hackett and William Carroll describe the "ideal" alternative medium as "progressive" and "explicitly opposed to particular axes of domination (corporate capitalism, heterosexism, racism, state authoritarianism)," while also direct about its own "stance of advocacy rather than pseudo-'objectivity.'"[43] Beyond just offering space for new voices, then, alternative media are seen as offering content and modes of being that work against, criticize, oppose, undermine, and denaturalize the dominant way of doing media.

This oppositional tendency in treatments of alternative media can very easily turn into a presumption of the effect of alternative media on the world around them. The impact of alternative media is an important locus of concern. There is tremendous skepticism regarding the extent to which alternative media are in fact effective in bringing about change in the broader world. Scott Uzelman urges caution when sorting out effects. He remarks on the "determinism of technique" that often shapes our understanding of alternative outlets, a determinism that presumes that "certain techniques of organization and struggle," including those exemplified by alternative media, "will produce emancipatory outcomes."[44] A similar concern is raised by Christian Fuchs, who warns about the "danger that small-scale local alternative projects will develop into psychological self-help initiatives without political relevance

that are more bourgeois individualist self-expressions than political change projects."[45] It is certainly a good idea to remain on watch for assumptions about the effects of alternative media in the absence of evidence.

Even with a healthy dose of skepticism, it is good to consider how alternative media have been assayed in terms of their effects on the world. Mike Mowbray helpfully sorts out two "levels of impact" that get tied to alternative media: "(1) subjective individual and immediate group-level impacts for participants in production; (2) broad social and political impacts related to public-formation, group representation, political deliberation, contestation and social movement formation/mobilization."[46]

These kind of "inward" effects on the people making alternative media, and "outward" effects for the world around these outlets, give us some sense of how to conceptualize potential effects. The presumption of smaller-level effects can be found, for instance, in the idea that alternative media provide a space for those who stand against a dominant order. "Alternative comics and fanzines," for instance, have been posited as "'virtual' meeting spaces where producers and readers unite in 'communities of dissent.'"[47] Here it is the real-life drawing together of people in the name of some shared meaning or cause—the founding or sustenance of a community—that is the effect. Alternative media can also be considered in terms of the connections they have with the rest of the world. The situation has been compared to Deleuze and Guattari's idea of the rhizome, which "ceaselessly establishes connections between semiotic chains, organizations of power and circumstances relative to the arts, sciences and social struggles."[48] Alternative media can, correspondingly, be conceptualized in terms of connections they can "establish with (segments of) the state and the market, without losing their proper identity and becoming incorporated and/or assimilated."[49] The effects of alternative media, in other words, can be registered through how they come to be connected, not just to small networks of individuals, but to much of the rest of the world through the workings of rhizome-like—non-linear, horizontal—networks of relations that inevitably connect alternative media to more sweeping power relations.

An important intervention in the conceptualization of alternative media can be found in Nick Couldry's careful attention to how "voice" comes to matter. We are of course accustomed to thinking about how alternative media can be linked to voice, if voice is taken to be the "value that motivates the production of alternative media."[50] As we have already seen, alternative media are valued for their capacity to allow all kinds of individuals and groups to speak up, and by extension, for this communication to be potentially effective and to garner

an audience. Couldry nudges us beyond this, "distinguishing between two levels: voice as a *process* (already relatively familiar) and voice as a *value*." [51]

This second level—voice as a value—becomes a crucial turning point for Couldry. Voice as a value "is particularly important at times when a whole way of thinking about social political and cultural organisation (neoliberalism) operates on the basis that for certain crucial purposes voice as a process does *not* matter." [52] Couldry pivots to argue in the affirmative, to say that "[t]reating voice as a value means discriminating in favor of ways of organizing human life and resources that put the value of voice into practice." [53] Couldry here draws on, and we point to, Clemencia Rodriguez's consideration of "citizens' media" as a touchstone for understanding voice as a value. [54] Rodriguez builds her case for citizens' media on how we ought not to think of "democracy as an ultimate goal, a final state-of-things to reach" but should instead consider "how democratic and nondemocratic forces are being renegotiated constantly, and how citizens' media can strengthen the former, thus contributing to the—although sometimes ephemeral—swelling of the democratic." [55] If we are to think of voice as a value in media processes, Rodriguez shows us what is being valued with her careful consideration of how citizens' media practitioners "may be relabeling the world, reorganizing reality, and reconstituting a new order where preestablished social and cultural codifications of power cease to make sense." [56] To value voice "then involves particular attention to the conditions under which voice *(as a process)* can be effective, and how broader forms of organization may subtly devalue voice," [57] an operation that can be found in colonialism and postcolonialism as much as in neoliberalism. This is subtle work here, benefiting from the reflexivity that comes from both a healthy skepticism regarding presumed effects, and a deeper appreciation of the extent to which regnant modes of social organization can be understood as devaluing our voices. An appreciation of alternative media calls attention to that silencing.

Couldry develops some corollaries regarding the workings of voice. If voice can be defined as "our capacity to make, and be recognized as making, narratives about our lives and the world within which we act, some further general principles follow." The first of these is that "voice is socially grounded," and thus it "depends on shared material resources, and the specifically social resources (including language) that enable and sustain practices of narratives." [58] Second, we can come to understand that "voice is a form of reflexive agency." Our "exchangeable narratives" that come from our voices are not just "random babblings"; they represent "a form of agency for which we take responsibility as agents." Like other things we do, the "stories we tell, . . . as Hannah Arendt argues [in *The Human Condition]*, 'disclose'

[54] We should point out that Rodriguez suggests that we "abandon the term 'alternative media' and coin a new marker: 'citizens' media.'" She sees "citizens' media" as superior because "'alternative media' rests on the assumption that these media are alternative to something, this definition will easily entrap us in binary thinking: mainstream media and their alternative, that is, alternative media." Clemencia Rodriguez, *Fissures in the Mediascape: An International Study of Citizens' Media* (Hampton Press, 2001), 20.

us 'as subjects.'" The third and final corollary is that "voice requires a material form which may be individual, collective or distributed." [59] In addition to "social resources," voice also "requires a form. Both are aspects of the materiality of voice." Couldry points out that the "material form of voice need not be under the exclusive control of the individual." The media, including alternative media, give us many examples of situations—newspapers, movies, and streaming video/television are obvious examples—where voice is "collectively produced." Particularly important for the digital age is the fact that "sometimes we can recognize ourselves in the outcome of a production where specific individual and collective inputs cannot easily be separated from a broader flow: this form of voice is not individual or collective, but 'distributed.'" [60] Voice can thus be appreciated as a socially grounded form of reflexive agency that can be given material form, and can be individual, collective, or distributed.

Another important intervention in the conceptualization of alternative media comes from Wendy Willems, who recommends nothing less than "a shift from an analytical focus on 'alternative media' to 'alternative mediation.'" [61] This shift is largely derived from Jesús Martín-Barbero's efforts to de-center the familiar object of media studies ("the media" or "alternative media") and replace it with a focus on process instead. The focus on mediations, as Omar Rincón describes it, involves no longer "instrumentalizing media as carriers of information" so "we can begin to truly see media as traversed by interrelationships between popular culture, industrial machines, and politics." [62] Significantly, this emphasis on process over categorization in the context of alternative media shares a great deal with Clemencia Rodriguez's rejection of the term "alternative media" altogether, in favor of "citizens' media," a term that she believes will lead us away from merely categorizing different media outlets as "alternative" or not. [63] For Willems, this avoidance of labels helps her to analyze the media in Zimbabwe, where "Western-driven media" outlets—often backed by NGOs—found alternatives in both government-run media outlets and in "popular jokes . . . circulated in public spaces, through e-mail listservs and via SMS messages." [64] The meaningfully alternative approach to communication could be found to a great extent in government-run media outlets, which runs counter to many (Western) understandings of how alternative media operate. She judges the idea of mediation superior to alternative media, in part because mediation can take these kinds of relational dimensions to heart. "A key advantage of the concept of mediation," she writes, "is that it refers to the dynamic process of communication as compared to a more static understanding of institutions." [65] Willems thus helps us find a way out of the question-begging morass of determining what is and is not an alternative media outlet, so that we can instead find our way to the more essential—if more complicated because more dynamic—issue of

how communication processes can be enacted as meaningful alternatives to dominant communication practices. None of this fully quells the debate regarding the effects of alternative media. It must be admitted that the capacity to effect massive influence is still largely the reserve of a relatively small number of large and usually state- or corporate-controlled media outlets. Nevertheless, this focus on mediation and on voice does help us to consider more fully the significance that alternative media can be understood to have.

Community Media

Where definitions of independent media are complex, definitions of community media in existing scholarship tend to to be more tightly circumscribed. These definitions are closely intertwined with the definitions of independent and alternative media outlined above. As with these other forms, community media are defined by the use of small-scale or non-commercial production and distribution networks. Like independent and alternative media, community media serve groups underrepresented or marginalized by commercial media, but importantly, community media prioritize questions of how underrepresented and marginalized communities can identify and attend to their own interests through local, accessible media networks.[66]

Definitions and considerations of community media tend to be more narrowly focused on practices of direct engagement. Chris Atton describes community media studies as being "primarily interested in social and cultural practices that enable people to participate directly in the organization, production and distribution of their own media" and which "are most often organized and produced by 'ordinary' people."[67] In this volume and across definitions of community media, the idea of "community" can address communities formed around shared interest, but the concept is most often defined geographically even as the form and function of community media can vary greatly.

While local interests may be lost in mainstream media, community media encourage direct engagement with their audiences and, in doing so, create spaces for community voices and community building. For audiences who feel "extreme dissatisfaction with mainstream media form and content," community media can provide avenues for "free expression and participatory democracy" that "enhanc[e] community relations and promot[e] community solidarity."[68] Ellie Rennie identifies both participation and access as distinctive qualities of community media which include "nonprofessional media makers" in production and "provid[e] individuals and community with a platform to express their views."[69] In some cases, involvement by community members goes beyond production to include management and policymaking. Community media serve an important function in providing opportunities for media makers to speak to and about the local communities to which they belong.

Even more than the other categories discussed in this volume, community media consider the democratizing potential of media—as tools that can develop civic identity and encourage

civic participation and as tools that are democratizing media production itself. As noted above, Clemencia Rodriguez defines a related category of locally-focused media she calls citizens' media. Where some studies of community media focus primarily on content, Rodriguez focuses on practice. By becoming active participants in citizens' media networks, as producers and as consumers, groups who are otherwise ignored or marginalized by existing media systems can become active citizens in their own communities. This category of community-focused media foregrounds empowerment as a central goal, encouraging citizens to "participate in actions that shape their own identities, the identities of others, and their social environment," and through doing so "produce power" within their communities.[70]

Access to the management and production of media often depends on the technical and financial demands of different media. Radio often attracts the attention of community media researchers as a result of radio's accessibility. Nick Jankowski argues that "because of the substantially less financial investment and operating costs [of radio] as compared to community television, community radio finds extensive application in development projects and among groups of resistance."[71] Various case studies highlight the importance of community radio platforms for resistance efforts.[72] Around the world, community radio has provided "a new communications paradigm" that shifts citizens' understanding of their own power and which can act as "a vehicle for marginalized communities to stake a claim in territory heretofore unquestionably ruled by the centre."[73] While radio is a powerful community-building tool, we see similar efforts by community TV stations[74]; digital community networks, online resources, and technology training centers[75]; and community filmmaking and film screenings.[76] Community media, then, come to be focused on building and maintaining direct connections to specific communities and are developed in order to serve those communities.

Pulling It All Together

A fundamental assumption that is broadly shared across definitions of IAC media holds that structural features of media organizations matter. This assumption, embraced also by critical political economists of the media, is frequently applied in critical understandings of

dominant media organizations—the small number of very large media firms that can reliably direct messages to very large numbers of people. This familiar political-economic critique of big media has been used to criticize these behemoths for undermining democracy, spreading imperialist ideologies, and operating counter to the needs of the public.[77] At the core of the arguments one finds an appreciation for how these dominant media organizations are, because of their size and influence, in many ways insulated from competition and aligned with other powerful forces, including other powerful capitalist entities and political elites. These organizations perpetuate themselves in large part not by responding to audience demand so much as by taking advantage of the benefits that accrue to established firms in twenty-first-century capitalism.[78] Economies of scale have long have long empowered dominant media to outcompete smaller entities, who must face choppier waves. Larger media corporations can plan further into the future, apply leverage more effectively to their competition and to other corporations with whom they collaborate, and take losses for a longer period of time than smaller operations. Larger media corporations can benefit from easier access to finance and to investors' massive troves of wealth. Because their operations are so well-financed, they inevitably develop strategies in media production that are focused on reducing risk, which leads to a reliance on formulaic and proven media products. Risk reduction is often paired with a drive to extend media corporations globally. This risk-reduced sameness becomes a significant chunk of what passes for global culture, undermining local cultures and advancing the interests of the powerful. In broad strokes, dominant media corporations are criticized for operating in a top-down manner: These are large organizations operating hierarchically within themselves and acting to preserve and control their own very powerful positions. While one might hope that such large and well-positioned media firms would have the spine to stand up to, say, authoritarian tendencies in twenty-first-century politics, we find more frequently that the dominant media firms remain too committed to their own interests in profit and risk reduction to justify much hope in their advocacy on behalf of democracy.

Much as the structural analysis of these dominant media organizations lends itself to a critical understanding of their roles in society, a structural understanding of IAC media shows us that "structures" in and of themselves are not the problem. IAC media operate separately from the dominant media and are as a rule much smaller in scale. They may or may not be profit-oriented. Almost without exception they are not publicly traded companies; one cannot buy stock in them. IAC media are accessible in a way that dominant media are not; they can

[77] Classics of the genre in the US and UK include: Ben Bagdikian, *The Media Monopoly* (Beacon Press, 1983); Robert W. McChesney, *Telecommunications, Mass Media, and Democracy: The Battle for Control of U.S. Broadcasting, 1928–1935* (Oxford University Press, 1993); Jeremy Tunstall, *The Media are American: Anglo-American Media in the World* (Columbia University Press, 1979); and Herbert I. Schiller, *Mass Communications and American Empire* (Beacon Press, 1971).

[78] The issue of supply and demand is—or should be—a complicated one in media studies. We hold that dominant media firms enjoy a position whereby their offerings come to be so ubiquitous that the very idea of demand becomes complicated. To turn this on its head, imagine a very small-scale publication, perhaps one that is printed in an edition of five copies. If someone found this and bought it, that would seem to be a more "demand"-originated moment of consumption than when someone elects to engage with media texts produced and distributed by dominant media firms. To be an audience member for something made by a dominant media firm is not much of a choice. It is more likely to be the result of habit, or of surrender. Descriptions of active audiences often miss the point that even the ability to gain access to some texts is unevenly distributed, and that texts do not require tremendous activity on the part of the audience (though they may be subject to all kinds of audience initiative).

be flexible, and they can be approached from without, as when an audience member demands explanation. In this sense, IAC media operate in a bottom-up manner, without substantial power in their respective markets and with less assurance that they can be sustained for very long. We have already seen Nick Couldry and James Curran's definition of alternative media as challenging the concentration of media power.[79] With media power concentrated in the hands of the (very) few, IAC media, simply by operating, come to be part of something "other than" what dominant media offer. IAC media are thus taken to be valuable because they can give the world something other than, something in implicit opposition to, what the dominant media do. They are structurally impelled to be something different. While dominant media operate according to logics of centralization and risk avoidance, IAC media operate according to a logic of diversification, and this puts them in a very risky business, where their operations are never too big to fail.

The existence and sustenance of IAC media in many cases depends on structures in place to preserve them. IAC media need: material resources (including a place to operate and technical equipment), means of generating funds, outlays of time available for media production and distribution, human capital (including all kinds of know-how and on-the-ground skills), social capital (personal connections between members of IAC media organizations and connections to the world around them), and some kind of meaningful linkage to the surrounding culture so that the content they purvey can claim some relevance. Given the tendencies of dominant media, we can see how IAC outlets benefit from low barriers to entry. When it is not extremely expensive to create and distribute media, it is easier for IAC media to operate. Zines are a classic example. Zines (short for "fanzines") are small-scale publications, distributed via mail order or in specialty stores. One reasons zines came into being and still exist is that they are very inexpensive to make. Access to a photocopier, a stapler, and a pen are frequently all that is technically required. This accessibility can be contrasted with broadcast television, in which even a single episode requires far more resources. This expense contrast is instructive for this reader, because it helps to highlight a theme that is often implicit: IAC media are frequently created and sustained when barriers to entry are low.

Much of the difference between IAC media and dominant media is brought out by Pierre Bourdieu's concepts of autonomy and heteronomy in cultural production. The value of autonomy—implied in such phrases as "creative control," "freedom of expression," and even "independent media," "alternative media," and "community media"—is connected to the situation where those who are making the culture are not beholden to or restricted by "outside" forces. Bourdieu describes the "field of restricted production," where "the field of large-scale production . . . is symbolically excluded,"[80] and where the "opposition between the 'commercial' and the 'non-commercial'" comes to be important.[81] This sense of exemption from large-scale production clears the way for a certain autonomy, a concern for something other than profit-oriented goals that are imposed from above. It is easy to go too far with a word like "autonomy"; for our purposes all that matters is that individuals involved in making IAC media are, as a rule, operating according to logics distinct from those that inform dominant media. Also implied here is the idea that IAC media are not isolated from dominant media;

[79] Couldry and Curran, "Introduction and Theoretical Perspectives," 7.

[80] Pierre Bourdieu, *The Field of Cultural Production* (Columbia University Press, 1993), 39.

[81] Bourdieu, *The Field of Cultural Production*, 82.

they are, instead, relationally identified in terms of how they make links to each other and in terms of how they differ from dominant media.[82] Another implication of this understanding of IAC media is that they can frequently be susceptible to certain types of exclusion, to creating symbolic barriers that keep some people out. Exclusion can be a welcome feature for those hoping to breathe life into a subcultural formation. The quality of being set aside from the broader culture can allow marginal groups to thrive. Of course that drive for exclusivity can also reproduce longstanding power relations around race, class, gender, sexuality, language, and more. Simply being set aside from the mainstream is no guarantee that the culture in question challenges dominant power relations. The dream of a world where everyone gets relatively equal access to the media is quite familiar, and this dream is often applied to new media technologies. When the World Wide Web became popular in the 1990s, there was considerable hope that we would all benefit from the enhanced power to create content alongside a dramatically increased range of content to receive. What actually transpired, of course, has been quite different. The web has become a welcoming home for finance-backed corporations accumulating user bases, where the asymmetries in media production have reasserted themselves. The financialization of media—including, but not limited to, the internet—has rearranged much of what we think of as "media industries" and drawn even large companies into strange new terrain inhospitable to variety and to the interests of smaller audiences.[83] Part of this can be understood in terms of Cory Doctorow's concept of "enshittification," which refers to the process by which companies doing business on the web come to place less and less emphasis on individual users or audience members as they focus more on other businesses as customers and then move on to investors.[84] The finance-intensive world of twenty-first-century media processes is rife with this kind of thing. *We suggest that IAC media can be thought of as unshittified media.*[85] They are definitively aimed at and put into conversation with audience members more than they are shaped by the interests of other businesses or shareholders. This reader can serve as a reminder that media can be put into service of the needs and desires of people.

How This Reader Was Assembled

The process of gathering material for the reader was marked by care and critical reflection. We set out to find as many article-length sources as possible. Such a list would, after careful scrutiny, provide the bedrock from which we could extract a volume that fit our interests. We began with databases and search engines such as EBSCO, ProQuest, Google Scholar, and Nexis Uni. We employed a variety of search terms that reflect the diverse IAC nomenclature: indie media, indy media, independent media, alternative media, grassroots media, activist

[82] For an excellent critical take on Bourdieu's notion of autonomy in the media—and especially in journalism—see Michael Schudson, "Autonomy from What?," in *Bourdieu and the Journalistic Field*, ed. Rodney Benson and Erik Neveu (Polity, 2005).

[83] See Andrew DeWaard, *Derivative Media: How Wall Street Devours Culture* (University of California Press, 2024).

[84] Cory Doctorow, "How Monopoly Enshittified Amazon," *Pluralistic: Daily Links from Cory Doctorow*, November 28, 2022.

[85] With sadness, we acknowledge that in many cases they just haven't been enshittified yet . . . Still we see great value in appreciating both the lack of attention to audience demand found amongst dominant media and the often very direct relationship with audiences found in IAC media.

media, community media, and participatory media. We then added medium-specific search terms ("comic books," "movies," "radio," and so on). We found thousands of candidate sources.

This is an *open* reader, so we winnowed out paywalled materials by focusing exclusively on those that are open access (OA). Here the sorting was, at times, difficult. Many publishers—especially from the dominant media—are intentionally unclear about permissions and copyright status. After checking and re-checking, we narrowed the list of thousands down to 284 OA academic texts.

We then began the hard work of selecting the pieces that fill this reader. We carefully weighed each source, guided by a vision of the kind of reader we want to use ourselves. Here are the criteria we used:

1. ***Relevance.*** Is the source centrally occupied with issues pertaining to IAC media? Or does it only touch fleetingly on the concept?
2. ***Recency.*** Does the source connect with themes that remain relevant today, in 2026? Would its inclusion in a course syllabus make the reader more relevant to undergraduate and graduate students today? Or is it primarily focused on issues that do not leave much to consider in our time?
3. ***Variety.*** Does the source, acting in concert with other sources, add something new to the conversation, something that diverges both from what students can be assumed to already know, and from what other sources in the reader have to offer?
4. ***Conceptual heft.*** Does the source identify concepts that give students and instructors tools for understanding IAC media more broadly? Can the source be put into sympathetic or antagonistic conversation with other items in the reader and elsewhere in a curriculum? Or does the source simply identify isolated parts of what could be a bigger story?
5. ***Inclusion:*** Does the source push the reader away from a reliance on issues coming out of the Global North and specifically from dominant parts of the social formations in the Global North? Is the subject matter or theoretical center of gravity inclined toward demonstrating the relevance of IAC media to oft-excluded groups? [86]

As we identified the texts, we also kept our eyes on the connections among them. We identified categories of texts as they occurred in literature searches. This allowed us to identify eleven sections for this reader:

[86] There is much to be said about how our quarry here—the world of open access articles and books—is capable of a deceptive exclusion. In many ways this mirrors the kinds of exclusion that Mohan Dutta et al. find at work in open science, where the broader rhetoric of "openness," supported by meaningful work to make data available to other researchers, comes to reperform norms of whiteness and Eurocentrism. A similar dynamic can be found in open access, where the open access itself conceals a situation where the availability and viability of open access as a practice is unevenly distributed, with strong power centers in Western Europe, the UK, and the US. It is worth pointing out that Latin American scholars have established meaningful inroads to open access (and one can detect the fruits of this important work by Latin American scholars and journals in this reader). See Mohan Dutta et al., "Decolonizing Open Science: Southern Interventions," *Journal of Communication* 71, no. 5 (2021).

6. ***Conceptualizing Independent, Alternative, and Community Media.*** This section features sources that address fundamental theoretical concerns regarding what IAC media are, how they can be identified, and why they matter.[87]
7. ***History, Memory, and Archives.*** Here we have gathered sources that highlight how IAC media are subject to historical forces, and how they can be linked to efforts to tie together collective memory.
8. ***Policy, Regulations, and Government Intervention.*** It would be wrong to presume that IAC media exist in a state of magical autonomy. The sources in this section demonstrate the often-subtle connections between IAC media and policies that threaten, protect, sustain, or weaken them.
9. ***Production and Distribution.*** The question of how media programming comes to be made and made accessible to audience members is of central importance to all discussion of IAC media. This section includes sources that highlight this part of the media process.
10. ***Labor, Funding, and Promotion.*** This section pulls together sources that deal with the micro-level concerns that confront those who work in the world of IAC media. These outlets could not exist without the work to sustain them through funding, promotion, and other forms of labor.
11. ***Messages, Narratives, and Representations.*** Though structural elements are often used to identify and define IAC media, it is important to consider how different orders of signification and meaning come to be associated with IAC media. What meanings are generated via IAC media? This section is populated with sources that give us answers to that question.
12. ***Audiences: Participation, Engagement, and Access.*** IAC media must be considered in terms of their audiences. Here we have gathered sources that explore and chronicle the activities of IAC media audiences, and how these activities come to matter.
13. ***Journalism and the Public.*** The significance of IAC media in helping to summon a public into existence is a major concern in much IAC media scholarship, and this section features articles that consider this process in a variety of contexts.
14. ***Community and Localism.*** In this section we feature sources that are largely concerned with how IAC media come to relate to space, and to the sustenance of local cultures. If dominant media are largely focused on global expansion, it should come as little surprise that IAC media can be described in terms of how they perform localism.
15. ***Networks and Social Media.*** The place of IAC media vis-à-vis the internet can be difficult to chart. The sources gathered in this section consider how issues related to internet-based media, including everything from social networking platforms to simple web content to actual internet networks themselves, can be connected to IAC media.
16. ***Activism and Resistance.*** Though other sections in this reader touch upon important issues related to politics and the public, we found numerous sources concerned primarily with activism

[87] We wish to acknowledge that, despite our efforts to be inclusive in as many ways as possible in our choices, this section tends to reproduce a global divide between a Western world that is thought of as capable of high-level theoretical work and the rest of the world, where theoretical work is often (very wrongly) thought not to be done. See Wendy Willems, "Provincializing Hegemonic Histories of Media and Communication Studies: Toward a Genealogy of Epistemic Resistance in Africa," *Communication Theory* 24, no. 4 (2014).

and related forms of direct political action. This section is dedicated to sources that attend to grassroots political efforts aimed at some form of direct action via IAC media.

As evidenced by the size and breadth of this reader—with its seventy-six sources across eleven thematic sections—we opted to err on the side of inclusion. We see this as entirely consistent with our own goals as instructors, and with the goals we envision for students. There are lots of ways to learn about IAC media. We hope we have provided a number of avenues for exploring this essential terrain.

Conclusion

We close by pointing out that this open reader has been published by an IAC media outlet, mediastudies.press. mediastudies.press is a community-supported, scholar-led, Diamond OA press (where one of us serves as co-director). Our process of assembling the reader has been in keeping with some familiar themes from IAC media discussed here and in the rest of the reader. Our work has been conducted in a manner that was independent from non-scholarly impulses, and the work is an alternative to volumes published by much larger presses. Perhaps most importantly, the reader represents an attempt to serve a community of scholars and students. It is always a good time to remember that classroom and scholarly communities are mediatized spaces, and this reader's construction drew inspiration from scholars curious about IAC media as well as from a range of IAC media workers around the world.

This open reader includes seventy-six entries. By any standard, this is a *lot* of content. We see this as justified first because we are casting a net over independent, alternative, and community media. This is an ambitious scope for any collection. Another justification for including so much material is that it allows us to demonstrate that there is a lot of high-quality open access scholarly work on this topic. An apparent bug—the wide range of selections, far too large for any single semester's syllabus—is, for us, a feature. We hope that this reader will lend itself to diverse classroom applications, and the abundance of content should give instructors and students more options, more points of contact, than a more tightly curated volume would.

Finally, we hope that this collection can become yet another powerful demonstration of the value of the open reader. Open educational resources (OERs) are already reasonably well established in the academy, but if any topic deserves a powerful demonstration of the utility of an OER, it is IAC media.

PART 1

Conceptualizing Independent, Alternative, and Community Media

CHAPTER 1

There is No Alternative: The Critical Potential of Alternative Media in the Face of Neoliberalism

Linus Andersson

tripleC: Communication, Capitalism & Critique 10, no. 2 (2012): 752–64. https://doi.org/10.31269/triplec.v10i2.357.

Abstract

This article was written in order to contribute to a discussion about a critical definition of alternative media. Asking what role alternative media could play in challenging neoliberal discourse in an age where capitalism have become immune to criticism, it elaborates on the concept of "the alternative" and the media through three sections. The first section discusses neoliberalism and the connection between neoliberal doctrine and mainstream media. This connection is described as promoting "public amnesia", financialization and economization of news journalism. The second section discusses alternative media from the perspective of new social movements and symbolic resistance, claiming that the symbolic resistance framework undermines the critical potential of alternative media, it also comments on some recent critical literature on neoliberalism and capitalism. The third section takes examples from artistic explorations of capitalism and television to propose how a distinction between social and formalist aspects of "the alternative" could inform a critical notion of alternative media.

Keywords

Alternative Media, Neoliberalism, Critical Theory

BY-NC-ND

Roughly ten years ago three books were published that became influential in the renewed interest in the study of alternative media (Atton 2002; Downing 2001; Rodriguez 2001). The past decade has witnessed not only the expansion of that field of research, but also considerable changes in the global media, global politics and economy. What is the role of progressive alternative media today, what significance has it and what challenges is it up to?

Looking around, it appears to be no alternatives. Not in political life; not in the economic sector; not in culture or the art world; not in the media. In political life, alternatives to the neoliberal administration which promotes as little public interference in the economic sector as possible have been if not absent, at least powerless in Europe for the past 20 years; in the art and cultural sector, cultural institutions have during this period resigned from their function as cultural public spheres into becoming economic enterprises, as artists and cultural workers have turned "entrepreneurs" in the creative industries; and as for the media and communication, the heady visions of democratization through world wide web and social media seems rather to have developed into new forms of exploitation of labour and further colonization of the life-world.

This article sets out to ask how "the alternative" can be conceptualized and approached, especially in the context of the media. By "the alternative" I do not imply an alternative classless society, as elaborated by utopian socialism or certain interpretations of Marxian theory (Ludes 2012), but more modest, the possibility of challenging neoliberal discourse and the possibility of a radical imagination (Haiven 2011).

The article is intended as a contribution to theory-development in the study of alternative media (e.g. Fuchs 2010; Sandoval and Fuchs 2010) and builds on the discussion of critical alternative media as promoting a radical imagination. Since "alternative" is a negatively defined term, the "norm" that this "alternative" is supposed to be an alternative to easily becomes a vague straw man. My approach in this article is to identify that straw man as neoliberalism, and especially neoliberalism's relation to mass media. Consequently, alternative media is understood as a potential for a critical discourse, challenging neoliberalism. However, the neoliberal version of contemporary capitalism has often proved quite able to co-opt such criticism and incorporate disaffection into capitalism itself, which poses a challenge for progressive alternatives (Boltanski and Chiapello 2005; McGuigan 2009; 2012).

Thus the question I wish to pursue in this article is: What role can alternative media possibly play as mediator of counter-hegemonic discourse in an age where capitalism seems to have become immune to criticism?

Drawing parallels to theory and criticism of new social movements, I argue that a critical understanding of alternative media might learn from experiences made in that field. Taking inspiration from artistic engagements with neoliberalism and mass media, the article connects alternative media with the prospect of a radical imagination.

The article is divided into three sections: The first one is called "The only way", and elaborates on the connection between neoliberalism and mass media; The second section is called "No Alternative", and discusses new social movements, anti-capitalist protests and some recent theoretical critical assessments of political economy; and finally "Alternative media or media of the alternative", that discusses formalist aspects of alternative media and relations to art.

The Only Way: Neoliberalism and Mass Media

In the spring of 2010 a group of European artists came together to address questions of contemporary (and historical) developments in capitalism in a project titled There is no Alternative (TINA). The title, referring to a statement originally attributed to Margaret Thatcher in the 1980s and a slogan in neoliberal economic and political discourse is a common point of reference for comments on development of political economy in a global context. The project and the exhibition took the statement serious and offered investigations into the financial market sided with historical narratives on speculative capitalism and performances about neoliberalism. The exhibition could be interpreted as both an illustration of how true the statement is today, as well as to point out that there are actual alternatives around and that the exhibition itself could be the starting point for thinking about alternatives.

The definition of neoliberalism that I use refers to what could be called the paradigm in contemporary capitalism that rests on principles of free markets; privatization, free trade and entrepreneurship (Harvey 2005). In the last couple of years neoliberalism has attracted a lot of critical investigation and discussion within social theory. Almost half (47%) of the 899 papers in the Social Sciences Citation Index with the term "neoliberalism" in the title were published after 2007 (SSCI accessed 2012-08-22). Probably this could be, at least partly, explained by two events. The first explanation is the translation into English of Michel Foucault's (2008) lectures on the birth of bio-politics, which traces the origins of liberalism and presents a discussion of neoliberalism that has inspired new investigations into the topic. The second explanation would be the financial crisis and economic recession of 2007–8 that initiated public discussions about the scope and probable decline of neoliberal doctrine in U.S. and Europe. In the following I will look at some notions of neoliberalism and link them to a discussion about the mass media's part in the neoliberal project.

What Thatcher's statement about "no alternative" points to as the only possible way is the market-liberal capitalism where organizations like the WTO have reached dominance over national legislation. This has been paradigmatic for European political life over the past 30 years and have afflicted the development (and perhaps demolishment) of public service and social welfare institutions in many countries. The expansion of the European Union and the Lisbon-treaty has strengthened the ideology of free markets and privatization of assets in recent years. Even though the world economic system shrugged because of the fiscal crisis of 2008 and many of the world's central economies are still facing a disastrous situation, there seem to be little or no plausible alternatives on the agenda. The economic crisis required large-scale state interventions, but political power has made very few demands and capitalism seems unchallenged.

From the research on neoliberalism one could distinguish between an idealist and a materialist definition and interpretation of the phenomenon. By idealist I mean the perspective where neoliberal doctrine is understood as a theory about the relations between politics and economy that was implemented in various degrees in the U.S. and Europe from the 1970s onward. This idealist interpretation treats neoliberalism as a mental conception, a set of ideas that became extremely influential (through the political course set out by Ronald Reagan and Margaret Thatcher) and that it was these ideas that determined the direction of the economy. The materialist perspective, on the other hand, sees the neoliberal doctrine as the theoretical

superstructure of a more fundamental class conflict, and is thereby a more classical Marxist analysis. For this materialist interpretation the set of ideas that is connected with the notion of neoliberalism (free markets, privatization, and minimum state intervention) is rather like a strategic discourse, a rhetoric that, though influential, was not a determining factor for the politico-economical course.

In the article "The End of Neoliberalism", Grantham and Miller (2010) equals neoliberalism with something like a worldview, similar to religion or nationalism, and their argument is that this worldview has come to an end due to the financial crisis and economic recession of 2008. They are representatives of the idealist interpretation of the concept neoliberalism that stresses the effect of mental conceptions over economic practice and material conditions. Put in Marxist terms one could say that in their understanding of neoliberalism, the super structure determines the base. Klein (2006) is another example of this idealist understanding of how the concept of neoliberalism spread across the globe.

Harvey (2010a) offers a more materialist version of neoliberalism. In *The Enigma of Capital* he suggests that neoliberalism should be understood as a struggle for class domination of capital over labour:

> "My view is that it [neoliberalism] refers to a class project that coalesced in the crisis of the 1970s. Masked by a lot of rhetoric about individual freedom, liberty, personal responsibility and the virtues of privatization, the free market and free trade, it legitimized draconian policies designed to restore and consolidate capitalist class power. This project has been successful, judging by the incredible centralization of wealth and power observable in all those countries that took the neoliberal road. And there is no evidence that it is dead" (Harvey 2010a, 10).

With this understanding of neoliberalism, it is possible to say that the rhetoric of neoliberalism could come to an end (or develop into more pragmatic nuances), but that the material class struggle underlying it is far from threatened or questioned by a change in the official discourse.

I might have over-emphasized the polarity between these two positions and a more nuanced approach would be to suggest a dialectical relation between the ideas of neoliberalism and capitalism's advancements. This dialectics between the ideal and the material is already present in a famous quote from Marx's *Capital*: "But what distinguishes the worst architect from the best of bees is that the architect builds the cell in his mind before he constructs it in wax. At the end of every labour process, a result emerges which had already been conceived by the worker at the beginning, hence already existed ideally" (Marx 1867/1990, 284). Hence ideas could be understood as material and the idea of neoliberalism has been as real and present (and maybe even more so) in our everyday life as has been the class struggle underlying them. Given that, our everyday experience of neoliberalism would be a possible starting point for an understanding of what neoliberalism means, how it is implemented and neutralized. This is what has been done in media and communication studies' approach to neoliberalism.

The Role of the Media

When it comes to the media there is some consensus between Grantham and Miller (2010) and Harvey's (2010a) positions: they both hold the mass media at least partly responsible for the promotion and implementation of a neoliberal doctrine. There have been quite a few

comments made on the relation between neoliberalism and the media, and as Couldry (2010) has pointed out, the relation of mainstream media in general to neoliberalism is much more complex than what one could hope to cover in a single article.

One could think of various possibilities to trace this connection. One approach would be to look at how neoliberalism has affected media and cultural policy: In Europe the broadcast media would serve as an example of how neoliberal discourse on privatization and "freedom" motivated a re-regulation of media (and cultural) policy that introduced commercial radio and TV. Hallin (2008) picks up on this and argues that the mass media is one of the most important social institutions to have been subjected to what he calls "enclosure" by the market logic of neoliberalism (Hallin 2008, 43; Hesmondhalgh 2008). Another way of tracing neoliberalism's entrance into everyday life through popular media is Couldry's (2008) analysis of reality-TV that argues that "the cruelties" of neoliberalism are translated into "ritual that enacts as 'play' an acceptable version of the values and compulsions on which that cruelty depends" (Couldry 2008, 3). A third approach, which I will concentrate on in the following, is to focus on what has been said on news and business journalism's role in promoting neoliberalism. Here one can talk of the part played by the media in shaping collective memory, and the (uncritical) economization of news journalism.

Even though he mainly focuses on the class struggle part of neoliberalism, Harvey (2010a) touches on a fundamental experience when he points to the media's role in promoting what he describes as a public "amnesia", an amnesia that makes the public forget and forgive the transgressions of the capitalist class and the destructive elements in the capitalist system. One could read into this statement the notion of "false consciousness" that prevailed in 1970's critique of ideology, but what Harvey is talking about is more manifest than that. Talking about how capital's advancements are framed in public discourse he writes:

> "We are enjoined to rejoice in the rebound in stock values for the capitalists because it always precedes, it is said, a rebound in the 'real economy' where jobs for the workers are created and incomes earned. The fact that the last stock rebound in the United States after 2002 turned out to be a 'jobless recovery' appears to have been forgotten already. The Anglo-Saxon public in particular appears to be seriously afflicted with amnesia. It too easily forgets and forgives the transgressions of the capitalist class and the periodic disasters its actions precipitate. The capitalist media are happy to promote such amnesia" (Harvey 2010a, 219).

The concept of public amnesia does not stop at forgetting systemic faults, but it also limits the possibilities for a radical imagination through forgetting memories of a radical past. Haiven (2011) has pointed to this political dimension of memory and remembrance in an era that has "conspired" toward a forgetting of radical memory (Haiven 2011, 60). Hence, a historical consciousness is a radical project.

The role of news and business journalism in the "making and breaking" of the financial crisis have been acknowledged by various scholars (e.g. Chakravartty and Schiller 2010; French et al. 2009; Grantham and Miller 2010; Lewis 2010). Their argument is that not only did business media play a role in legitimizing the financial processes that preceded the crisis of 2008, but also that "in the last three decades, stories prominent on the pages and screens of the globally integrated financial news media exerted a powerful form of symbolic violence, normalizing and depoliticizing what were not too long ago understood as fringe economic theories" (Chakravartty and Schiller 2010, 686). For Grantham and Miller (2010) too it is in

the mass media's version of "the financialization of everything" (Harvey 2005, 33) that the neoliberal influence reveals itself:

> "Perhaps neoliberalism's most pernicious impact on popular communication has been the financialization of news and current affairs […]. The focus of "news" has become stock markets, earnings, profits, and portfolio management. Journalists stalk politics in order to discredit democratic activities that might restrain capital" (Grantham and Miller 2010, 176).

This tendency of a preoccupation with "the economy" on a content level not only affects news journalism but entertainment as well, as Jim Cramer's Mad Money on American CNBC is perhaps an extreme, yet figurative example of. This could be taken as evidence of the economy's colonization of the public in the media—a colonization that marginalizes the possibility to recall radical events of the past, and to forget those transgressions of capitalism.

No Alternative: Capitalism's Incorporation of Disaffection

In the previous section I pointed to instances where the media was understood to be a part of the problem: both in terms of reproducing a neoliberal ideology through developments in journalism and entertainment, and by limiting a radical imagination through "public amnesia".

One way of seeking for an alternative to this tendency would be to turn to "alternative media" as a space that can maintain integrity and keep an oppositional position against a neoliberal agenda, and support a radical imagination. Alternative media could be described as ways of organizing, producing and using media outside of the established system, motivated by different norms, goals and ambition than those commercial or public organizations that we generally meet in our everyday media use. In other words: "Alternative media is a sphere that challenges the capitalist media industry. Alternative media are way [sic] of organizing and producing media that aim at creating critical content that challenges domination" (Fuchs et al. 2010, 199).

As I mentioned in the introduction, this object of study has attracted much interest from media scholars over the past decades, partly because of the explosion of alternative outlets due to the spread of the internet, and partly because of the interest in extra-parliamentary organizations and new social movements in the early 2000s. One way of framing the interest in alternative media is that it proposes the bridging of a gap between two critical traditions in media studies: political economy and cultural studies. Here was an approach and an object of study that took macro, structural-level critique into account while still acknowledging the agency on an actor-level. Obviously this resonates on the deep and long-standing discussion within the social sciences about structure and agency and where to locate social change on that scale. Atton and Couldry (2003) described the growing interest in alternative media against a backdrop of "loss of momentum through the 1990s of some other critical traditions within media and cultural studies (for example, ideological analysis) in a sea of methodological doubt and militant particularism" (Atton and Couldry 2003, 580).

A recurring theme in the literature on alternative media is that the concept lacks a proper definition (e.g. Fuchs 2010; Sandoval and Fuchs 2010; Bailey et al. 2008; Coyer et al. 2007). In some sense the problem with defining the term might derive from an uncertainty as to whether "alternative media" as a concept is an analytical construction, or if it remains on a spontaneous

level, i.e. that scholarship has imported a term from common language (we somehow "know" what it is, but have trouble defining it) and that it has not left this common-sense-status.

This uncertainty has resulted in researchers replacing "alternative" with another, assumedly more precise, prefix, e.g. "radical" (Downing 2001), "community" (Howley 2005), "citizen" (Rodriguez 2001), "autonomous" (Langlois and Dubois 2005),"tactical" (Raley 2008), "critical" (Fuchs 2010). The benefit of this pluralism is that the problem with the notion of "alternative" (a negatively defined concept) does not need to be dealt with. However, this threatens to lead into a particularism that covers a crypto-ontology about mainstream and alternative that constitutes a fundamental ontology for these types of studies. What is missing (or perhaps present in its absence) is a discussion about the "alternative".

In this discussion about "the alternative" we could benefit from a distinction between a social and a formalist notion of alternative.[1] In the field of the social and the political sphere, an alternative could be linked to such things as "an alternative worldview", i.e. ideas and utopian visions about what a society could be. In the field of aesthetics, in art and entertainment, an alternative more often refers to "alternative modes of expression", i.e. experimental forms, languages and "recodifications". By keeping this distinction in mind it might be possible to think about what kind of alternative a media of the alternative might be. Partly this alternative connects with ideas and political demands by progressive grassroots and social movements.

New Social Movements and Symbolic Resistance

If we define alternative media as the media of social movements (as has been suggested by e.g. Dagron 2004; Downing 2001; Downing 2010), or a means for symbolic resistance, it is important to make clear what kind of social movements we are talking about. Otherwise there is a risk of ending up with something that looks like just another aspect of life style politics, where alternative media becomes the news output for the "alternative" segment of a target audience. Example of this could be found in Haiven's (2007) critical account of AdBusters magazine that reveals how the criticism of capitalism that the magazine (and the movement) presents is ill informed in its activism and criticism of consumerism and capitalism. In the following I will point to aspects in the theory of new social movements and symbolic resistance that have been absorbed by the capitalism that it set out to criticize, and my concern is that we ought to find ways to think "the alternative" that do not fall into the same trap.

This critique is not intended for those popular oppositional uprisings of recent years that have mobilized in e.g. Chile and Mexico, or protests in Spain, Greece, and Great Britain that opposes budget cuts in higher education or resist harsh economical demands of the IMF, nor does it concern the successful revolutions in Northern Africa of last year. Rather it wishes to separate "the alternative" from a certain kind of western countercultural resistance with its roots in the 1960s and that have recurrently been "co-opted" or become a market niche in the capitalist market society.[2] To give an example: for someone engaged in the animal rights movement in Sweden it is probably easier to lead a "cruel free" life today than it was

[1] It is possible to find parallels between this and the distinction made by Boltanski and Chiapello (2005) between social and artistic critique in the anti-capitalist movement of the 1960s.

[2] There are various accounts of this tendency of "co-optation", or capitalism's incorporation of criticism. For a general historical account, see Cross (2000). A more specific case of counterculture and information industry can be found inTurner (2005).

30 years ago: vegetarian alternatives are common in restaurants and grocery stores (even at McDonald's!). At the same time the total consumption of meat in the country increased by 33% between 1980 and 2010 (Jordbruksverket 2012). The paradox is obvious: a lifestyle dedicated to animal rights has been a commercial success, but the aim to decrease the slaughter of animals for food has apparently failed. This example resembles Thomas Pepper's (1972) critique of the underground press in the U.S. of the 1960s and similar cases have been made about the anti-capitalist critique in the kind of symbolic activism associated with culture jamming (Heath and Potter 2004; McGuigan 2005).

There are various accounts that tell us how symbols and representations have become increasingly important for understanding social and political power under postmodernity (e.g. Duncombe 2002). One important aspect of this is the notion of "new social movement", and Melucci's (1997) approach to social movement studies, an approach that took representations and symbolic action into consideration and inspired a cultural turn in social movement research. This was sided with the works of Eyerman and Jamison (1991) who with their cognitive approach offered new insights into the youth movements of the 1960s. This turn is usually described in terms of a shift of interest towards post-material values and a step beyond sociological definitions of class relations. One could argue that social movements replaced class as the agents in the discourses on social change. Where Marx and Engels had claimed that all social history is the history of class struggle, social movement theory proposed a more liberal, non-determinist or non-evolutionist perspective of how societies change (Sztompka 1993, 274 ff.). The social class is historically determined while the social movement has to be mobilized out of singular agents. This turn from class formations to social movements is ambiguous. It may provide a more flexible form of analyzing social change than the structural explanations had done, but it runs the risk of losing the big picture in the ambition to stress the agency found in the actors, it also comes close to a discourse that stresses individuality similar as can be found in neoliberalism (Haiven 2007).

Since new social movements are conscious of a symbolic dimension it is motivated to take a more detailed look into the idea of resisting symbolic power through "challenging the codes" (Melucci 1997). The idea that representational systems and symbols construe an important locus for activism found theoretical support both in postmodern thinking about the importance of signification, and in new social movement theory. McGuigan (2005) has referred to this tactics as "radical subversion". He presents a quite sceptical account of culture jamming where it is questioned whether it can present any real critical effect or political impact at all. Some of his criticism is interesting to take part of as it might also have relevance for a definition of alternative media.

The reason for McGuigan's scepticism lies not only in culture jamming being an idealistic movement working in the realm of signification, but also because it is "élitist and, to many, either downright offensive or simply unintelligible" (McGuigan 2005, 438). It is easy to imagine how culture jammers attacks on consumerism could be interpreted as an attack on the lifestyle of "ordinary people" rather than on the system that makes consumerism a necessity. Since consumption is an integral part of everyday life it is difficult to find large popular support for a movement that opposes it. And, as Haiven (2007) has shown, the individualistic character of this kind of activism is close to neoliberalism.

Culture jamming was a child of the 1990s and seemed to have vanished, or lost its relevance a decade into the 2000s, but interestingly enough, Adbusters—the spearhead of the international culture jamming movement managed to spark a new kind of anti-capitalist protest when the Occupy Wall Street phenomenon entered the public in the fall of 2011. To many, this was seen as a return of a political momentum from the 1990s, lost since 2001.

Various publications (Taylor et al. 2011; Chomsky 2011; van Gelder 2011) have praised the novelty of this movement and as it spread from Wall Street over the world, the term "occupy" became a new slogan for anti-capitalist resistance. The Occupy movement offers something different than culture jamming as it takes the symbolic to the physical. It also differs from culture jamming in that its address is populist rather than elitist. Pointing out the finance capital as the main problem has been a successful strategy of both leftists and right-wing populists during the 20th century, and it is perhaps easier to sympathize with a movement of "the 99%" than with people who make you feel bad about your consumption habits.

But does this mean that the occupy-movement has resolved the contradictions of earlier versions of symbolic resistance? This is hard to say, but one could look to some interesting tendencies. First, there are cases where the populism has made some traditional leftist activists nervous because it is unclear who you are marching (*camping)* with. Especially in those cases where hackers network Anomymous and the Occupy-movement have made common efforts. [3]

Secondly, the stress on the urban makes occupy practices (as well as some recent comments from David Harvey (2012) about the city as locus of radical social change) vulnerable to the fetishisation of urban life that is at the core of gentrifying processes in contemporary society. Again, as with McGuigan's (2005) critique of culture jamming, the popular tendencies of the argument risk facing the same fate as did much of the critique of the 1960s (Rancière 2010; Boltanski and Chiapello 2005; Heath and Potter 2004). The urban character of the occupy-movement could easily be adopted (co-opted) by the same kind of urban development-lingo about "creative class" (Florida 2005) etc.

Alternative sources of information, knowledge and culture are indeed important in order to challenge the ideological standstill in the official media discourse and invoke a radical imagination. But there is also a risk that the abundance in alternative voices made possible by new media technologies leads to what Dean (2009) has described as "psychotic media": communicative capitalism's abundance of alternative voices and talk without response.

Dean has introduced the concept of communicative capitalism, referring to "the materialization of ideals of inclusion and participation in information, entertainment, and communication technologies in ways that capture resistance and intensify global capitalism" (Dean 2009, 2). Dean points to weaknesses of alternative media definitions that over-stress the participation-aspect and the transformed social relation between the producer and the audience is at fore (as in Bailey et al. 2008, and Atton 2002). Over the last decade we have seen how many of those features previously attributed to alternative media have become part of everyday mainstream media use. What is left of the concept "alternative media" if every media practice resembles it? It's engagement with progressive social change?

[3] One example from Sweden was how Anonymous fronted anti-feminist attacks on a small independent theatre's stag- ing of Valerie Solana's SCUM Manifesto (see http://anonopssweden.blogspot.se/2011/11/opscum.html).

It is in line with this argument that we should read Fuchs' (2010) call for a Marxist theory of alternative media. His argument is that the theoretical approaches applied on alternative media studies have stressed process and action aspects of alternative media, understanding them as self-organized, citizen-controlled, self-managed etc. Hence they have been treated more in terms of their organization than on the form and content level. He suggests a shift in focus from process and organization to "critical product content that formulates visions of an alternative beyond capitalism" (Fuchs 2010, 188). This is what Fuchs believes should be required from a critical theory of alternative media.

The Alternative: From Particularism to Communism

It is indeed difficult to outline alternatives. Sharp critics of contemporary politics, economics and culture often fall short on the task of presenting the visions of an alternative route. Couldry (2010) makes an effort to think about culture and politics after neoliberalism through the concept of voice. In his analysis neoliberalism has set limits to the possibilities for humans to give account of themselves and their place in the world. His ambition is to use voice as a way of saving the idea of democracy from its neoliberal implications and he does so through a critique of neoliberal economics and politics, but also through an analysis of the connections between neoliberalism and mainstream media. One could, however, object to his approach by saying that it may go beyond neoliberalism but it does not go beyond capitalism.

In fact, there is evidence that suggests that any attempts at proposing an alternative to capitalism is futile, since such alternatives are effectively neutralized under what Boltanski and Chiapello (2005) have labelled "the new spirit" of capitalism. In line with this argument, McGuigan (2012) asks:

> "Now, radical political culture is much quieter if not exactly silent and the questioning of capitalism's legitimacy muttered only perhaps in jest. Why should such questioning appear to be unspeakable in contemporary discourse, if heard seriously at all in the public sphere, sounding nostalgic and distinctly passé? Is it really beyond our imaginative capacity to countenance an alternative? What imaginary prevents it?" (McGuigan 2012, 430)

Similar claims have been made by Simon Critchley (2011) who suggests that we are living through a long anti-1960s, a four decade long reaction against utopianism. Part of this is explained by the incorporation of disaffection into capitalism itself (McGuigan 2009, 1). Capitalism has become immune to criticism, in the same fashion as communicative capitalism creates a post- democratic pseudo public where all kinds of critique may be voiced without any consistent response. This is also the challenge for alternative media: how remain a critical alternative when the target of criticism seems unaffected, or in some cases even strengthen by the criticism?

Harvey (2010a) has stressed how the importance for an alternative movement is to produce alternative mental conceptions. Some believed that the aftermath of the financial crisis would serve as an opportunity for imagining such alternatives. Thus was the interpretation made by Grantham and Miller (2010) who suggested that the crisis, with its ties to the media, would bring forth the possibility of an alternative:

> "If this latest failure undermines neoliberalism, as we suspect, then the death of Yanqui journalism, destroyed by its own weapon of financialization, will bring into being a new world of popular com-

> munication. We can only guess what that will look like—but we must fight for its future" (Grantham and Miller 2010, 176).

Given the various setbacks of the political left in Europe over the last decades, it may however seem as if the TINA prophecy has been proven right (e.g. the 2009 election to the European parliament where the socialist and leftist groups lost over 20 mandates from the previous period). Many commentators of contemporary politics have noted this lack of momentum in the European left and absence of a strong oppositional movement to the political and economic doctrine of neoliberalism. Some of these commentators do actually go further and insists on pointing to the fact that perhaps the problem is not to be found in neoliberalism but in the capitalist system itself.

While the lack of political opposition to neoliberalism, the theoretical produce in traditional leftist thinking has thrived in recent years, as well as an upsurge of titles on Marx and Marxism (e.g. Eagleton 2012; Hobsbawm 2011; Jameson 2011). One event that was influential for this development was the publication of Hardt and Negri's trilogy *Empire, Multitude and Commonwealth.* In the closing passage in Empire, Hardt and Negri made the bold move to write: "biopower and communism, cooperation and revolution remain together, in love, simplicity, and also innocence. This is the irrepressible lightness and joy of being communist" (Hardt and Negri 2000, 413). From thereon we can see how the notion of communism resurfaces in the literature, not at least with titles such as *The Idea of Communism* (Zizek and Douzinas 2010). This phenomenon would in itself be an interesting object of study; have perhaps the 20 years that passed since the collapse of the Soviet Union made it legitimate to again speak of communism? Or have 30 years of neoliberalism radicalized the opposition? In any way, what those books offered, as well as commentators such as Harvey, Badiou and Zizek, is a return to an attempt to do theory with a capital "T", and draw a "big picture" meta-perspective of political economy on a global scale. At the centre of these books is a developed and thorough critique of contemporary capitalism and even the reintroduction of the concept of communism.

Badiou (2008) introduced the notion of the "communist hypothesis" in an essay in *New Left Review* where he claimed that the communist hypothesis is a regulatory function rather than a programme and that:

> "As a pure idea of equality, the communist hypothesis has no doubt existed since the beginnings of the state. As soon as mass action opposes state coercion in the name of egalitarian justice, rudiments or fragments of the hypothesis start to appear. Popular revolts—the slaves led by Spartacus, the peasants led by Müntzer—might be identified as practical examples of this 'communist invariant'. With the French revolution, the communist hypothesis then inaugurates the epoch of political modernity" (Badiou 2008, 35).

The task of leftists today, says Badiou, is to determine where in the history of this communist hypothesis we find ourselves. Zizek (2009) elaborates on this in First as Tragedy, Then as Farce, and in a similar way Harvey points to the original meaning of being communist: "as those who understand the limits, failings and destructive tendencies of the capitalist order" (Harvey 2010a: 259). This identification of the alternative with communism suggests a path somewhat different than the social movement theory of the 1990s. If the ideas of the 1990s often stressed the spontaneous, carnevalesque and symbolic dimensions to a politics

of cultural resistance (Cohen 1993; Duncombe 2002), the books referred to above suggest a sterner version of critique of capitalism. Whether this is a consequence of "big theory" or an expression of a radicalization of the alternative remains unclear but the fact that the "spectre" has reappeared in political philosophy is quite interesting. We could then ask the question whether "the alternative" should be understood as equal to communism.

Also in the field of media and communication studies, calls for a more elaborate social theory have been made (e.g. Hesmondhalgh and Toynbee 2008), claiming that the field for all too long have existed in a backlash of the heavily theorized 1970s, and therefore avoided to get involved in big picture theory. This ambition is visible in the field o alternative media research as well. As Sandoval and Fuchs (2010) have argued, a minimum criterion for a critical alternative media would be to produce a content that points at "the unequal, dominative and non-participatory character of contemporary society" (Sandoval and Fuchs 2010, 146).

Alternative Media and Media of the Alternative

From the argument presented in the previous section it may appear as if "the alternative" is synonymous to communism, and that a media of the alternative consequently would simply be a communist media. Even though it might be possible to sketch out a normative notion of something like a media that strives for equality and create commons, I would rather add another notion of "alternative" to the discussion, one that presents an alternative to neoliberal enclosure of cognitive resources, as might be found in the realm of art. Artistic interventions have a privileged position when it comes to explore and experiment with forms and expressions. However, I will argue that even if it may be productive, it is not unproblematic to include an artistic dimension in the definition of alternative media.

This is by no means the first time a suggestion to look at formalist aspects of alternative media has been made. For instance, Atton (2002) includes form and aesthetics in his influential typology of alternative media (Atton 2002, 27). Another example is Clemencia Rodriguez, who in a comment on the video-blog *Future of the Book*'s special on alternative media in 2007, stated: "More and more I am convinced that we need to value the revolutionary potential of expression, re-codification, re-invention of languages to express experience."[4] Rodriguez' comment finds a counterpart in Coyer et al. (2007) who suggested that "any truly 'alternative' media work will need to transform the medium itself, change the way in which it is used, an find alternative styles and alternative languages in which to express itself, if it's 'alternativeness' is to be maintained" (Coyer et.al. 2007, 91).

Underlying these claims is the presumption that there is a connection between aesthetical forms and social action. Through its form, alternative media might realize a critical perception that supposedly reaches deeper than does merely a critical content. Fuchs (2010) suggests a definition of alternative media as critical media through a typology of five qualities. Two of those concern formalistic aspects of alternative representations:

> "The second quality of critical media is negation at the form level. The form of critical media products challenges human consciousness so that imagination is potentially advanced and suppressed possibilities of development can potentially be imagined" (Fuchs 2010, 181).

[4] http://mediacommons.futureofthebook.org/imr/2007/12/11/deconstructing-television-from-within-the-alternative-aesthetics-of-paper-tiger-television (accessed September 3, 2012).

This bears echo of the notion of a "radical imagination" (Haiven 2011), and Harvey's (2010a) call for alternative mental conceptions. On a more concrete level, the formal aspects of critical media are elaborated in aesthetical terms:

> "The fourth quality of critical media is dialectical realism at the form level. Dialectical realism (form) means that the form involves rupture, change, non-identity, dynamics, and the unexpected" (Fuchs 2010, 182).

It might however be appropriate to make a few comments on these suggestions, as both quotes imply a quite instrumental notion of perception. What is absent from the first quote is what we could call a sociological sensitivity in the notion of aesthetic experiences. Bourdieu (1996; 1984) has in numerous works convincingly shown how the ability to "advance imagination" through aesthetic perception is the product of social disposition tied to what in Bourdieu's terms are referred to as cultural capital and habitus.

In the second quote Fuchs exemplifies what could be called "stylistics" of critical media. This list of features bears much resemblance to alternative aesthetics of high modernism and the historical avant-garde, features that in e.g. television studies have been declared stock goods in commercial mainstream television (Caldwell 1995; Butler 2010).

Still there are some parts of Fuchs' proposal that might prove useful for advancing the theoretical work on alternative media. Acknowledging the formalistic aspects is one way of circumventing the dead end in critical media theory set up by the "participatory turn" in mainstream media (i.e. the rise of "convergence culture" and the "prosumer"), where many of the characteristics once ascribed to alternative media now have become part of everyday mainstream media consumption.

On a theoretical level, the introduction of a formalist aspect into the discussion about alternative media's role in promoting a "radical imagination" of the alternative comes across an interesting inconsistency in the meaning of the word alternative. Where it's social connotations concern an alternative mental conception, or view of the world, the more aesthetical connotations are tied to an advanced stylistics of modernism and avant-gardism, an alternative with a purpose of being anti-popular.

There is reason to claim that critical assessment of neoliberal policies are found more in the artistic realm than in the (mainstream) media. As we have noted in previous sections, the mass media has been held partly responsible for the endeavour of promoting neoliberalism (by "public amnesia", financialization of news). While journalism seems to have resigned from the task of scrutinizing the effects of political implementations, contemporary art has shown an increased interest in social and economical issues. Let me return to the exhibition "There is No Alternative" that I mentioned earlier:

> "Following the collapse of communism TINA [There is no alternative] has become something of a slogan, embodying the neo-liberal viewpoint that the only viable economic and political system is global free market capitalism, coupled with the renewal of the creed of individualism. The aim of the project is to challenge the clearly hegemonic intent of Thatcher's statement 'TINA' and examine the contradictory relationship between capitalism and the idea of liberty from a historical perspective" (Plender 2010).

Thus opens the folder for the "There is no alternative" art exhibition that took place in Stockholm, Sweden in the spring of 2010 and that included artists from a wide range of Eu-

ropean coundtries to explore capitalism in its present guise. In a way the program from the exhibition responds to what I earlier suggested for a critical definition of alternative media. We found in the section on neoliberalism and mass media that the role played by the media in promoting neoliberalism could be summed up as "public amnesia", and financialization of journalism. What many of the art works in the "There is no alternative" exhibition did was precisely to historicize capitalism and discuss the experience of neoliberalism in everyday life. Some examples of this include (quotes from the exhibition catalogue):

> "Unnar Örn: 'Capital Drive'
>
> As the title would seem to imply, the works deal with the representation of the seemingly forward motion of capitalism. Based on archival imagery and language appropriated from the promotional brochures produced by Sweden's national bank (Riksbanken) as well as banks in Iceland and the USA between the 1930s and 1970s, Unnar Örn explores both how these institutions chose to describe their activities and represent their own history".
>
> "Petra Bauer: 'Swedish Stories—Part Three: How Can I Resist the Neoliberal Development?'
>
> In this third part, she [Bauer] will reflect on the role reality TV programmes play and will demonstrate how she thinks they are connected to the country's recent political development as the welfare state model is being dismantled. Using examples of programme's such as 'Swedish Idols' and the American 'Extreme Home Makeover', Bauer explores the idea that these shows represent a kind of citizenship training; teaching subjects how to develop the characteristics necessary for a neo-liberal society".

What Bauer's work wishes to show is similar to Couldry's analysis of reality TV's place in the neoliberal society (Couldry 2010; 2008). But what these examples also show, are alternative forms of framing and problematize the relationship between culture, neoliberalism and capitalism. However, while these works deal with the content matter of political economy we should also look at instances where artists address communication and media.

There is a parallel movement to this exploration of capitalism that consists of artistic interventions and investigations into the mass media. Not only does the approach in the works cited above resemble the critical "readings" of popular culture of American Alternative TV-collective Paper Tiger Television (Halleck 1984), but among the participants in the TINA-exhibition, at least three of them have earlier been engaged in projects about the media, and especially television. Olivia Plender, Katya Sander and Petra Bauer have all contributed to the Swedish public access show Good TV, hosted by artists, and was aired between 2004 and 2008. Good TV was a project interested in the symbolic power—political and aesthetic—of television in contemporary society. And it was not alone in this endeavour, there seemed to be a current among artist around 2005 that turned to television in order to explore questions of representational forms and aesthetical power. [5] The early 2000s was also the time when the Italian TeleStreet-movement appeared and began pirate transmissions in the borderland between social and formalist critique of contemporary media culture (Ardizzoni 2010).

These examples of television alternatives might at first seem arbitrary and haphazardous, insignificant marginal phenomena, but I would argue that they present a good example of the dialectics between a social and a formalist definition of "alternative". A strong benefit with these artistic approaches to television is that they radically negate what could be called the

[5] I have elaborated on this phenomenon and the forms of critique involved in television produced by artists in Andersson (2012).

populist impulse of TV. Instead of building transmission around the ideal construction of an audience of "the people" they allow for a complexity in content and form that promotes ambiguity rather than redundancy. Instead of claiming objectivity by providing its audience with stories that are already familiar and confirms established norms they can allow themselves to be subjective and encourage critical abilities of the viewer.

If we were to take Sandoval's and Fuchs (2010) requirement a step further, artistic interventions in television show us how the media can promote contradictions and complexities and thereby also engage its viewer in a critical assessment of mainstream mass media. That would be an alternative media that not only produce a critical content but also present tools for a radical imagination.

Conclusions

I began the article with the statement that there is no alternative. No alternative in politics, economy, culture, art and media. In response to this I asked what role progressive alternative media could play in promoting a radical imagination against neoliberalism.

My inquiry took its departure from a definition of neoliberalism and the connection between neoliberalism and media. While complex, this connection was concentrated on two things: first the promotion of "public amnesia" where capitalist transgressions are effectively removed from public debate; and secondly the uncritical financialization of news journalism that resigns from the task of critically scrutinizing economic development. An alternative media approach to this would then be a type of media discourse that emphasize historical contextualization, and a critical scrutiny of economic policy.

In the section called "No alternative" I discussed some critical approaches to "new social movements" and symbolic resistance. I argued that a definition of alternative media as media of social movements becomes vulnerable to the type of criticism raised against new social movements. I also discussed the "alternative" in relation to recent writings in critical theory and how the notion of communism has entered that discussion.

The third section dealt with formalist approaches to "the alternative" and how some examples of art works have addressed questions of neoliberalism and capitalism as well as media (e.g. television). "The alternative" could be discussed in social and formalist terms, where the former denotes the alternative worldview, and the latter refers to alternative modes of expression.

The (re)introduction of the notion of communism into the critical discourse is an example of defining an alternative in social terms, and it might suggest a new linguistic agency in the critique of neoliberalism. When Margaret Thatcher announced that "There is no alternative", it was motivated by the end (or near end) of communism. Since then the idea of communism has been marginal and politically impossible. Perhaps the works cited in this article points to a radicalization of the critique of capitalism and that alternative media, or a media of the alternative, will tap into that radicalization.

On the formalist aspects I pointed to some artistic projects that addressed capitalism, neoliberalism, culture and the media. Although there are limits to art's possibilities for encouraging a radical imagination (e.g. it's elitist and exclusive realm), initiatives such as the exhibition "There is no alternative" and the public access show "Good TV" are examples of how

social issues could be addressed in a form that is almost as complex as the issues themselves. That possibility for complexity could be a second contribution to a media of the alternative.

This distinction between a social and formalist understanding of alternative might bear resemblance to Boltanski's and Chiapello (2005) concept of social and artistic critique of capitalism. Part of their argument is that the disintegration of these two aspects of criticism laid the foundation to the present situation where capitalism seems immune to criticism. This is visible in the criticism of post-material new social movements that points to how they too often have become absorbed by the system it was set out to challenge. A further task for a media of the alternative would be to avoid becoming too closely associated with such a project where it may find itself an easy target for criticism against countercultural resistance (e.g. Haiven 2007; McGuigan 2005; Heath and Potter 2004).

About the Author

Linus Andersson will defend his PhD-thesis in media and communication studies in October. He is affiliated with Södertörn University, Sweden. The thesis analyses forms of critique in television produced by artists. Andersson has published work on alternative media, social movements and media aesthetics. He is currently involved with a project about political extremism and the internet.

School of Culture and Communication, Södertörn University, Huddinge, Sweden.

CHAPTER 2

Uncommunicative Partners: Social Movement Media Analysis and Radical Educators

John D. H. Downing

MATRIZes 3, no. 2 (2010): 51–61. https://revistas.usp.br/matrizes/fr/article/view/38258.

Abstract

While the research literature on alternative media, participatory media, tactical media, social movement media, continues to expand and explore this significant realm of public communication, it tends at the present time to be very heavily analytical. This is vital work but, I will argue, insufficient to meet the social and economic demands of the day. A quite frequent absence in this research literature is, equally, attention to the interface between educational activities and socially committed media. It is as though thinking about media and thinking about education had been placed in solitary confinement, albeit in neighbouring cells. These issues demand urgent attention. The paper will focus principally on the potential in colleges and universities, but not only in those educational contexts, for constructive interactions from all "five corners" of the media firmament. These are, in no special order, media analysis, media activism, media arts, media industry professions and media policy-makers. There are moments and places of overlap between one or more of these, but too often, there are not.

BY-NC-SA

Sadly, although people and groups in this pentangle are deeply concerned with media communication, they rarely talk with each other, despite some progress in this direction within the current media reform movement in the USA.

Keywords

media analysis, activism, social movement media

Introduction: some definitions

My main task is to address what some in our digital media era have termed "the Long Tail" of media (cf. also National Alliance for Media Arts and Culture 2004), in other words media which have gone under various headings: alternative media, citizens' media, community media, tactical media, independent media, counter-information media, participatory media, Third Sector media, social movement media. Each of these terms carries its pluses and minuses.

Thus from one perspective "alternative" media is a completely vapid designation, since everything is alternative to something; yet from Chris Atton's angle of vision, the term's very vagueness encourages us to acknowledge how everyday cultural practice is suffused with an extraordinary variety of alternative media forms (Atton 2001).

"Citizens' media" for Clemencia Rodríguez is a term that acknowledges the force field of cultural citizenship (Rodríguez 2001); yet in the era of mass refugee movements and undocumented labor migration, the word 'citizen' as applied to media has to be explicitly stripped of its legal connotation.

Ellie Rennie has developed a very effective case for using the term "community media" (Rennie 2006); yet in my view, this term is still always haunted by the "misty-rosy" undertones of the word "community."

"Tactical media" is the term favored by internet activist and writer Geert Lovink (2002: 268), even though his explanation of the term is almost an anti-definition: [tactical media is] "a deliberately slippery term, a tool for creating temporary consensus zones based on unexpected alliances… hackers, artists, critics, journalists and activists… Tactical media retain mobility and velocity."

In situations then where the "post-modernity" concept has genuine analytical traction, "tactical media" is no doubt a viable term, moving and grooving in sync with Hakim Bey's notion of Temporary Autonomous Zones (Bey 1991). I am sorry if I horrify anyone here with the prospect that post-modern Amsterdam with a Social-Democratic administration may not be the Zeitgeist in its entirety, but the further one moves from that arena Lovink's term does risk becoming threadbare.

"Independent media" is the term favored by Herman and Chomsky in order to denote non-corporate, non-state, non-religious news media. The term has a primarily rhetorical motivation, namely to dispute the frequent claim that news media in liberal capitalist polities, especially the USA, enjoy full freedom and independence. So far so good; yet the implicit news bias in Herman and Chomsky's use of the term forecloses on a whole array of grassroots media and cultural expression that have nothing directly to do with news or journalism.

"Counter-information media", originating with the late Pio Baldelli (1977), but still very much current (Vitelli & Rodríguez Esperón 2004) is also a term framed very much within the journalism arena, where "information" is used as a synonym for news. Undoubtedly, the mission to fill in the gaps and distortions in hegemonic news sources and empirical specifics is an important one, as mainstream war and ecological news coverage repeatedly demonstrates. Yet we need much more still than punch-for-punch counter-information, and than an information strategy whose agenda is dictated by the need to respond rather than radically reframe.

"Participatory media" is a term used intensively in global South development projects, and in its original design meant that people affected by these projects should have an active role in framing them and subsequently evaluating their progress (Mefalopulos 2003). This strategy also prioritized the ways in which media of all kinds should be involved to these ends, in other words the dead reverse of top-down communication strategies. Habits die harder than rhetoric, however, and in practice the term "participatory" has mostly become an empty buzzword batted to and fro among development administrators in their RFP documents.

"Third Sector media," denoting media in the voluntary social action sphere, is a term sometimes used in European discussions. It is implied, though not actually used, in the European Parliament's report Community Media In Europe (European Parliament 2008). It is a policy-based term primarily defining these media as what they are not, in other words that part of the media spectrum which is not commercially, governmentally or institutionally funded. It is thus a convenient term for media policy debate, but offers no more than this.

"Social movement media" is the term I tend to prefer (Downing 2008), inasmuch as it anchors these media projects in social movements large and tiny, constructive and repressive, all of the above. On the other hand, it has to be admitted that there is a vast plethora of small-scale media, from parish magazines to mosque bulletins, from zines to fan websites, which only partially or not at all carry any intimate connection with any kind of social movement.

At this point, we might be inclined to agree with Bolivian video-maker, author, poet, film historian and media activist Alfonso Gumucio Dagron (2004) in his cry of despair at the iron determination among academics to produce absolute definitions of social realities—definitions to which those realities are then required to conform. And we need to acknowledge a further basic reality, that defining these media is bound to be far more difficult than defining mainstream media, whose forms and genres and organizational structures are really quite restricted in comparison. It should not surprise us then that the definitions that I have just skated through overlap at points, and are always lacking. It is a direct reflection of these anthropologically polymorphous media forms.

Until the beginning of the present decade, media projects of this ilk—most often small-scale, often ephemeral, almost always under-funded or entirely unfunded—were basically under the radar of conventional media research. They were too messy, too pathetic in comparison to mogul media, and altogether too "nano" to be worth spending precious research energy on.

That scenario has changed quite noticeably, with the publication of more and more research studies in this area, many of them of book-length, and with the emergence of an annual international conference dedicated to such media, the OurMedia/NuestrosMedios conference, which to date has met in the USA, Spain, Colombia, Brazil, India, Australia and Ghana. With the advent mid-decade of the so-called "social networking" sites such as YouTube, MySpace, Facebook and the rest, to sweep airily past this zone of research has ceased to be plausible.

The question now is whether that should be a matter for satisfaction? Should we break out the champagne to celebrate a new healthy bouncing child for the rapidly expanding media research family? Or alternatively, from the vantage-point of Britain's critics of media studies for whom our field is a fertile straw man, is it high time to put media research on the morning-after pill?

I think neither. I want to push debate in an entirely different direction. I am taking the inclusion of the word "humanity" in the conference title and "strategic action" in the panel title to indicate commitment to the social consequences of our research and teaching. Within that frame, I plan to continue my discussion of social movement media within an overview of the frequent current configuration of Media and Communication Studies programs. These, in my view, have a crucial fault-line. Or lines.

The Pentangle

Those intensively involved in media issues outside the academy form, I would suggest, a pentangle. In alphabetical order they are media activists; media analysts; media artists; media industry professionals; and media policy-makers. There are indeed those who double up as media educators and analysts, or industry-based analysts, or government-based researchers, but let us stay with the pentangle for a moment.

What is striking about this pentangle is the frequent degree of suspicion and even worse, mutual depreciation, among these points on the media compass. Media industry professionals roll their eyes at media studies, and the academics return the compliment. Media activists roll their eyes at both, and if either pays any attention, the compliment is returned. Media artists often see media activists as pre-aesthetic, and in turn are defined by them as self-absorbed elitists, though both agree the media academics to be generally removed from anything that matters much. Some media policy-makers bemoan the lack of useful input they seem to receive from these other quarters, while other media policy-makers simply rely on corporate input and get on with it. Either way media policy-makers are like media analysts, frequently a target of scorn and mistrust, seemingly the only common communication currency within the pentangle.

These divisions and still more tend to reproduce themselves flawlessly in the academy, where Media Studies and Media Production are not only separate departments, but often split between the social sciences and the arts, or in the USA where cinema studies and rhetoric studies may be in Liberal Arts, while Journalism Studies fiercely protect themselves against pollution by Communication Studies. Even in departments where media makers of various kinds and media analysts co-habit, there is often mutual suspicion and fear that resources will be unevenly allocated to one wing or the other. Even if there is not competition for scarce resources, as in "we desperately need someone in animation/media economics/journalism/film history", and even when internal relations are friendly and respectful, the curriculum typically juxtaposes analytical and media-making courses but does not seek in any strong way to get them beyond flirtation and actually married. So students often graduate with a gorgeous mosaic in their heads of mutually insulated knowledges.

It's a syndrome with very deep roots. The division of labor between thinkers and doers is etched into our history and social fabric, and affects many more activities than media. As

Richard Sennett writes in his recent book *The Craftsman* (Sennett 2008: 11): "History has drawn fault lines dividing practice and theory, technique and expression, craftsman and artist, maker and user; modern society suffers from this historical inheritance."

These divisions today are actively throttling the real potential of media education programs to enable an engaged rather than superficial dialogue among the five points on the media compass. This issue is not unique to media programs. Glenn Adamson's absorbing analysis of the relation between thinking about craft and thinking about art (Adamson 2008), while never engaging with media production and therefore rarely discussing collective media practice, demonstrates in passing throughout how entrenched is the instinct to establish impassable chasms between real creative workers and mere craft producers. We do not *have* to follow Howard Risatti in his exhaustive efforts to chart the essential differences among art, craft and design in his *A Theory of Craft* (Risatti 2007), or in his failure too to move beyond the individual artist or craft worker to the collective reality of media production, in order nonetheless to recognize in media production the intelligence of the hand, of the experienced brain in action. As Risatti puts it, speaking of the craft worker but by implication about most of us, media makers, media analysts, media educators: "…material… needs to be lovingly coaxed into functional form" (Risatti, op. cit.: 107).

We media educators, especially, are able in many instances to provide a forum for these differing interests and activities to engage with each other, even though participants in such fora may quite often depart shaking their heads and wondering what they were doing there. The potential for mutually illuminating dialogue in such quasi-neutral spaces is nonetheless there, and it is a failure of mission, in my view, for Media programs not to use their facilities to encourage a serious mutual engagement, not least in their own and their students' interests. Of course this knowledge exchange will be riven by social interests, some of them no doubt mutually incompatible. But that's not news and is no reason for not working at making it work. It is a large but crucial agenda, and inasmuch as it flies in the face of history and our proclivity for mutual jealousy, it is a radical education agenda, one that the growing Media Reform movement in the USA increasingly evinces.

Indeed, elements in this argument, though I had not realized so when initially writing this analysis, were first put forward by Canadian media researcher Marc Raboy nearly twenty years ago. He proposed then that in the interests of expanding the reach of substantive, strong democracy, those involved in media issues should aim to link forces in five areas: critical media analysis, media literacy education, creation of autonomous media, support for constructive initiatives within mainstream media, and involvement in media policy-making (Raboy 1991: 169–171).

Social Movement Media and Radical Media Educators

I want in the last segment of this presentation to zero in on just one facet of radical media education, namely the potential interface between the social movement media activism which I reviewed at the outset, and media educators. Us here, in many cases.

First point: a frequent vice of Media Studies educators—and I can't cast the first stone either!—is to disentangle and strip down media praxis in ways students may find initially revelatory and even deliciously shocking, but which often risks educating them in the higher

cynicism, disarming them as citizens rather than kitting them out. Where this happens, media analysis risks leading to severe political disability.

Second point: while many media studies programs likely cannot afford anything approaching a classroom equipped for film or video production, audio production, or student news production, none of us here needs telling that with our laptop we can research, produce, edit, create graphics and audio, and transmit our media content to anyone who understands our language and is connected. That cuts out great numbers of people with old computers and intermittent electricity supply, but still leaves a growing multitude around the planet. As iPhone technologies develop, more and more of us will be able to use them as well as laptops. A recent study, The Horizon Report 2008 (New Media Consortium 2008)—a global network of about 300 educational organizations—flags grassroots video and collaboration webs as technologies currently banging down our doors as educators, and mobile broadband and data mash-ups as only two or so years away from doing the same. Three or four years away at most, they argue, there will be increasingly available collaborative learning technologies, which will prod us to re-cast our still very vertical models of instruction. [1]

In turn this already means that media programs in affluent countries and in major cities in many countries, with no professional or even sub-professional production facilities, and also media studies programs with no connection to media arts programs, are now able to start to offer production courses. Programs in creative advertising are a perfect illustration of what has been possible for years now, but there are many more examples currently available. From the most elementary educational perspective, this dimension of their media analysis coursework will enable students in those programs to think and speak far more sentiently and fluently about the construction of media products than would otherwise be the case. Ideally some would take scriptwriting and production management courses, which would not require expensive equipment either, but would take them into the inner cogs of the media process.

However, my point is more than this. It is that for media educators and analysts who wish to pursue issues to their roots, radicals in other words, this junction of analysis and practice offers a critically important opening to the proliferation of social movement media abilities, experiments and experiences. Now if you are really content with the media systems we have, you should probably slope off and get a coffee or a beer at this point. If you are bored to the coccyx with talk about environmental issues, issues of "race" and ethnicity, gender, class, global poverty, war, you are now officially excused from even trying to keep your eyes open.

For me, our priorities as media educators need to be shaped by recent contributions such as historian Peter Linebaugh's study of the global influence of Britain's 13th century Magna Carta and the Forest Charter. These established certain basic rights against the power of kings and the rights of common land ownership. Linebaugh points out how, invoking these charters, repeated equivalent assertions of common rights have surfaced over nearly eight centuries now, and have provided "the right of resistance to the reality of a planet of slums, gated communities, and terror without end" (Linebaugh 2008: 279). Our priorities also need to be shaped by veteran political scientist Sheldon Wolin's *Democracy Incorporated* (Wolin 2008), in which he dissects with the aid of modern political history and political philosophy what he terms the dangerous contemporary U.S. trend towards an "inverted totalitarianism."

[1] My thanks to my colleague Dr Angela Aguayo for drawing my attention to this report.

He describes this as the U.S. regime's "genius in wielding total power without appearing to, without establishing concentration camps, or enforcing ideological uniformity, or forcibly suppressing dissident elements so long as they remain ineffectual" (Wolin 2008: 57), an argument echoing a book by Bertram Gross on U.S. politics some thirty years back, entitled *Friendly Fascism* (Gross 1980). He restricts himself to the USA, but the Blair, Berlusconi, Sarkozy, Putin, Hu phenomena are hardly unrelated, and collectively serve as cover for despotic regimes from Belarus to Burma. And our priorities need to be shaped by David Harvey's discussion of dialectical utopianism in his *Spaces of Hope* (Harvey 2000).

Yet they may also be constructively shaped by considering the many specific historical cases of the actual junction between education, art, craft and analysis. I will instance just two. One is described in April Masten's new study of the numerous women professional artists of the Unity of Art movement in the period 1850–1880 (Masten 2008), who after their education at New York's Cooper Union became painters, designers, illustrators, engravers, colorists and art teachers, working in newspapers, a wide range of magazines, book-publishing, design and other spheres. The entire philosophy of the movement, to some degree influenced by Britain's John Ruskin, was to overcome the gap between art for everyday media use and art for exhibition, between analysis and practice.

My second example is the collage movement in Central Europe in the period 1918–1945. In Matthew Witkovsky's *Foto* (Witkovsky 2007), the exhibition volume of a collection of collage photography of that period which showed at the National Gallery of Art in Washington DC, and at the Scottish National Gallery of Modern Art in Edinburgh, Scotland, chapters 3 and 7 in particular throw up a fascinating assemblage of projects that brought together artists, media analysis and education, and social movement media. These ranged from Berlin dada and the Bauhaus, which are well known, to groups much less known until this exhibition such as the Blok group in various Polish cities, the Devětsil group in Prague, Brno and Českе Budějowice, and the Zenit group in Belgrade the School of Applied Arts (ŠUR) in Bratislava. Photojournalism was one major expression of this international movement, and John Heartfield's work for the Arbeiter Illustrierte Zeitung is far and away its best known example, but a huge range of other activities were evident in Central Europe in those 25 years.

To sum up then in two sentences: in the face of the widespread political immobilism that has greeted Bush-Cheney, their clones and their admirers, our media education programs can and must communicate through making media, not only by dissecting them and where the "learning-by-doing" dimension of our program is stamped by the hegemony of commercial media production's priorities and fads, our task must be to encourage our students to develop "constructive schizophrenia," the ability to play the commercial game if need be for survival while constantly retaining critical mental distance from it and the longing to change it.

CHAPTER 3

Communication and Struggles for Alternatives

Christian Fuchs

In *Communication and Capitalism: A Critical Theory*, 337–52. University of Westminster Press, 2020.

Abstract

This chapter deals with the question of how communication matters in struggles for a commons-based society. First, the notion of praxis communication is introduced (section 14.1). Second, the chapter discusses the role of alternative media as critical media in social struggles (14.2). Questions of class struggles, communication in class struggles, and struggles for alternative communications deliberately form the conclusion to this book. Given that the many problems outlined in this book result from our capitalist world and capitalist communications, the point is to change the system, which can only be achieved through social struggles. Praxis, class struggles, and social struggles are critical political economy's practical implications.

Praxis Communication

Praxis

How humans react to forms of domination (including exploitation) is not programmed. Some endure violence and oppression because they fear consciously or unconsciously that they may lose something. But resistance can emerge over time or rapidly. Humans neither automatically endure nor automatically always resist domination. Humans' existential fears and needs can be instrumentalised so that they accept domination. Social struggles of dominated groups always imply risk-taking and uncertainty. When a large enough number

CC BY-NC-ND

of the oppressed take such risks and engage in collective organisation, then resistance to domination comes about. The formation of a collective dimension of consciousness is part of such organisation processes.

In organising politically, humans communicate in order to define goals, identities, and strategies that help them in transformative processes. Political consciousness has the potential to be progressive, but is not automatically progressive. A better society is a possible, but not a certain result of social struggles. Only when objective contradictions trigger the collective political organisation of protests and movements that aim at progressive changes is there a chance for the establishment of a better society.

Critical theory's differentiation between practice and praxis was introduced by Karl Marx. Marx writes in his 'Theses on Feuerbach': '#3 […] The coincidence of the changing of circumstances and of human activity or self-change can be conceived and rationally understood only as revolutionary praxis. […] #8 All social life is essentially practical. All mysteries which lead theory to mysticism find their rational solution in human praxis and in the comprehension of this praxis'.[1]

For Marx, human beings are practical because they transform society through practices. By praxis, Marx refers to a certain form of practice. Praxis refers to political practices whose goal is a human-centred society. Praxis-oriented humans see such a society as a political need of human beings and try to demystify ideologies that aim at hindering the establishment of such a society. Praxis includes class struggles that aim at abolishing exploitation and domination. Antonio Gramsci argues that the philosophy of praxis critically questions common sense.[2] Praxis wants to establish an 'absolute humanism'.[3] For Gramsci and Marx, praxis is the critical political form of human practice. Praxis is related to socialism and wants to establish a '*free community of free personalities*'.[4]

Marxist humanism combines socialism and humanism. It is based on the insight that critique and praxis 'grasp the root of the matter. But for man the root is man himself', '*man is the highest being for man*'.[5] Praxis is based on the insight that a good society means a good life for all. Based on this insight Marx articulated the '*categorical imperative to overthrow all relations* in which man is a debased, enslaved, forsaken, despicable being'.[6]

Praxis Communication

For Jean-Paul Sartre, praxis is purposeful human action. He therefore argues that 'language as the practical relation of one man to another is praxis, and praxis is always language'.[7] This means that, for Sartre, language and communication are always praxis and there is no sig-

[1] Karl Marx. 1845. Theses on Feuerbach. In *MECW Volume 5* (pp. 3–5), pp. 3 & 5. In the English translation of the 3rd and 8th Feuerbach-theses, the term 'practice' instead of the term 'praxis' was used. In the quotation I have rendered the term as 'praxis' following Marx's own usage in the German original.

nificant difference between practice and praxis. For Sartre, communication is always already praxis and does not become praxis through socialist politics. In comparison to Marx, Sartre depoliticises the concept of praxis. If all communication were praxis, then the term praxis communication would be tautological. In contrast to Sartre, the approach taken in the book at hand differentiates between practice and praxis and between communication as practice and praxis communication.

Praxis communication is a particular form of human practice that has an ethico-political character. *Praxis communication is always communicative practice*. But only a subset of *communicative practices* is *praxis communication*. Communication is not automatically good. It is not automatically a means to question domination. Communication is a practice through which humans create and reproduce social relations. They do so by using symbols and interacting symbolically. In communication, humans make meaning of each other's behaviour and utterances. But this mutual referencing does not imply that the participants in a conversation necessarily agree or understand each other. Social struggles and political action can transform communicative practice into praxis communication. Praxis communication takes place within democratic-socialist organisations, groups or structures, or aims at the establishment of such humanist structures. *Praxis communication* is not about society as it is, but about how we can achieve an actual, true society that corresponds to human needs and develops all human potentials so that all benefit.

Activists use communication technologies such as the Internet to challenge exploitation and domination. Alternative online news media such as Democracy Now! or Alternet and digital commons projects such as Wikipedia or Creative Commons question the capitalist character of digital media. Besides such alternative civil society Internet projects there are also potentials for the development of public service Internet platforms. Civil society and public service Internet platforms challenge the corporate Internet giants. They want to create a commons-based, non-commercial, non-profit Internet.

Neither technology nor individual people can radically transform communications so that capitalist communication are transcended and replaced by communication commons. Such a change requires critical individuals who organise politically and engage in class struggles about the character of communications and society. A commons-based society and commons-based technologies can only be achieved by human praxis.

Class struggles in capitalism are a conflict between capital and labour that is expressed in particular practices. It is labour's objective interest to sublate the conflict between the opposing interests of capital and labour so that a classless society emerges, whereas it is the objective interest of capital to uphold the class conflict. There are mechanisms such as lay-offs, rationalisation, strikes, outsourcing, wage negotiations, etc. that do not sublate, but mediate the class conflict. The mediation of the class antagonism only temporarily settles the conflict either more in the interest of labour or of capital. But given that the interests of capital and labour are polar opposites, the class conflict cannot be overcome by mediation. In contrast, the sublation (*Aufhebung*) of the class conflict creates a new whole that eliminates class structures, lifts the individuals to a new existence in a class society, and thereby constitutes a qualitative difference.

Figure 14.1 presents a model that situates the role that communication and communication technologies play in protests and struggles in a broad context.

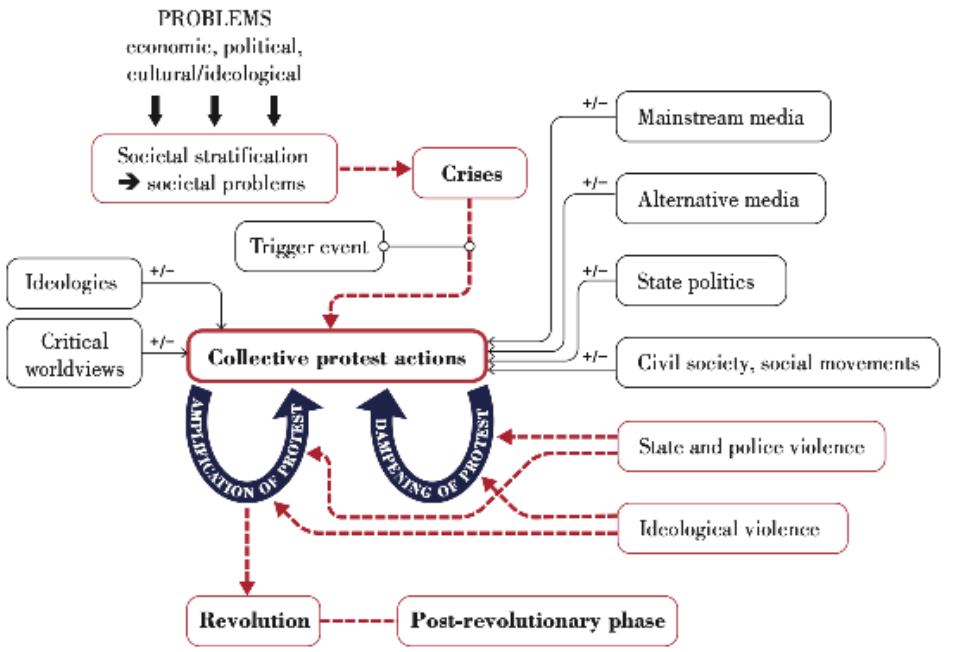

Figure 14.1: A model of praxis communication in social struggles.

Protests are based on the structure of society, especially society's economic, political, and cultural contradictions. These contradictions result from particular forms of domination that bring about societal problems. As a consequence, there are phases when societies enter crises. A crisis is a necessary, but not a sufficient condition for the emergence of protests. There are economic, political, and cultural/ideological crises. If such crises interact and converge, then a crisis of society as a whole emerges. For protests to emerge, there must be public recognition of the existence of society's problems, and a significant number of people need to be convinced that these problems can no longer to tolerated and that society needs to be changed. Protests and social movements often emerge from trigger events. Examples are the emergence of the US civil rights movement after the arrest of Rosa Parks, the emergence of the 2011 Tunisian protests after Mohamed Bouazizi's self-immolation following harassment by public officials, the triggering of the 2011 Egyptian revolution by the police's killing of Khaled Mohamed Saeed, or the emergence of the 2013 Gezi protests after police violence against the occupiers of Taksim Square in Istanbul.

It is precisely in such situations that emotions such as anger, class hatred, socialist love, and hope play a role in the potential transition from crises to protests. Subjective perceptions and emotions are, however, not the only factor, because protests are conditioned and influenced by politics, the media and culture/ideology. The way state politics, mainstream media and ideology, on the one hand, and oppositional politics, social movements, alternative media and alternative worldviews, on the other, connect to human subjects, directly influences the conditions of protests. These factors can have rather amplifying, rather neutral, or rather dampening effects on protests. So, for example, racist media coverage can advance racist stereotypes and/or the insight that the right-wing media and class society are racist in

themselves. In an antagonistic society such as capitalism, the means of communication have an antagonistic character. They have antagonistic impacts and effects, which means they can have multiple effects at once and in general either intensify or diminish protest or not have much effect at all on the level of protest.

There can also be antagonisms and power struggles between various media, such as between capitalist media and non-commercial media. But the media is certainly not the only domain of society that shapes protests. There are also other aspects of the economy, politics, and ideology/culture that shape and influence the conditions under which protests emerge and develop, or do not emerge. Multiple dimensions of society influence protests. Given this complexity, it cannot be calculated whether and when protests will develop. When protests emerge, the various factors and dimensions of society continue to have (often contradictory) influences on protests. And protests can also influence other domains of society. To what degree there are positive, negative, or neutral influences is not pre-determined. In antagonistic society, the state, too, often reacts to protests with police action. State violence and ideological violence (e.g. the scapegoating of protesters in tabloid media) directed against protesters influence protests in ways that are not determined. These influences can bring about the intensification or the dampening of protests, or can have no significant consequences at all.

Under certain conditions, protest can intensify in a spiral so that the movements, occupations, and demonstrations become larger and larger. The result can, but does not have to be, a revolution. Revolution means a fundamental change of society so that the economy, politics, and culture are reconstituted and renewed. Revolutions always have post-revolutionary phases in which society needs to be reconstructed. The legacy of old conflicts and the old society can in this context pose challenges.

Communication technology in an antagonistic society, in which the class conflict and other conflicts between dominant and dominated groups matter, is likely to have a contradictory character: It does not necessarily and automatically support/amplify or dampen/limit rebellions, but rather poses contradictory potentials that stand in contradiction with influences of the state, ideology and capitalism.

The next section focuses on alternative media as critical media.

Alternative Media as Critical Media

A Model of Communication

Figure 14.2 visualises a model of the communication process.

There is a dialectic of structures and practices of communication. They produce each other mutually. The media system is a dynamic system, in which human subjects' communicative practices and communication structures stand in a productive, dialectical, mutually constitutive relationship.

In the media system, we find journalists and other media producers as subjects who make use of particular structures and technologies in order to create content directed at a broad public. They want to shape the consciousness of the members of the public by informing them. Particular media contents have a more or less artistic and aesthetic, news or entertainment character. Created content needs to be organised, stored, and distributed, for which

special structures and technologies are needed. Users and audiences receive and interpret distributed content.

The production, distribution, and reception of content are dialectically connected. Without reception, there is no need for further production. Produced content is not effective if it is not received and interpreted. Produced content needs distribution and reception. Reception is not just the consumption of information, but also produces meanings. Reception is consumption and production. Recipients interpret content in the context of their everyday life. What meanings they give to objects depends on their historically conditioned social contexts and experiences. Meanings are social and historical. Under different circumstances, it is likely that an object will be interpreted in different ways. Producers encode certain meanings into content. But there is no guarantee that the recipients will decode the text in the manner intended by the producers. But at the same time, decoding is not arbitrary, because there are power dynamics that influence meaning-making. Different interpretations of content can

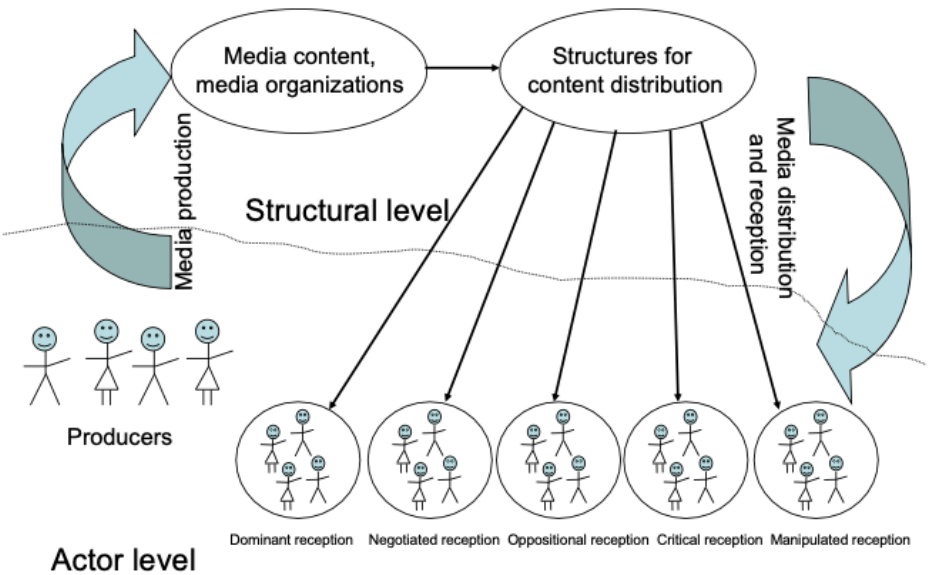

Figure 14.2: The communication process.

coexist and contradict each other. There is neither a necessary convergence nor a necessary divergence of encoded and decoded meanings. Power dynamics can result in recipients reproducing hegemonic meanings. There are different forms of reception: hegemony, opposition, mixed meanings, critical reception, and manipulated reception (see chapter 5, section 5.5). There can be overlaps between first three and the latter two types of reception.

Media and communication systems are not just social systems, they are social systems that reach a wider public and are therefore part of communication processes in the public sphere. Therefore, the notion of the public sphere is important for a social theory of the media in general (see chapter 8) and therefore also for a social theory of alternative media. For their operation, media systems and organisations need producers, recipients, organisation structures, distribution structures, and contents. The communication process of the media is based on the dialectic of structures and actors.

For Stuart Hall, there are hegemonic, oppositional, and negotiated (mixed) interpretations of texts.[8] In order to avoid a relativistic approach, one must assume that there is a degree of objectivity in the communication process. An example: If anti-fascism is the dominant ideology and a message is encoded based on the dominant worldview, then fascism must be characterised as oppositional. Hall's distinction between dominant, oppositional, and negotiated meanings is too restrictive and relativistic. Hence the notion of critical reception/consciousness is added in figure 14.2.

A critical interpretation or meaning is an insight that enables the individual to put domination and exploitation into question and to develop models of society that focus on advancing benefits for all. A co-operative society is the true and essential form of society and human existence. Manipulation tries to advance interpretations that are a form of false consciousness, i.e. that do not put into question exploitation and domination, but rather foster and legitimate class structures and structures of domination in general. Critical and manipulated decoding/interpretation/consciousness are particular forms of consciousness.

The model shown in figure 14.2 has a structural level and an actor level. These two levels interact. Information workers are located on the actor level. They produce content that is publicly communicated. Actors involved in the communication process include journalists, other media workers, and audiences. Media structures include, for example, institutions, products, and technologies used for the production, distribution, and reception of content. Production is the basis for distribution and reception. Distribution and reception in turn are the foundation of further production. In the media system there is a dialectical, dynamic process, where actors and structures interact with each other.

Alternative Media, Critical Media

Alternative media are media that challenge the dominant capitalist forms of media production, media structures, content, distribution, and reception. Table 14.1 is based on figure 14.1. It gives a comparative overview of potential characteristics of alternative media. Not all of these characteristics are necessarily qualities of or conditions for the existence of alternative media. The model shows an ideal-type with a maximum number of characteristics. The central aspects are media producers, recipients, and practices of producers and recipients on the actor level; products, organisations, and distribution structures on the structural level.

In antagonistic societies, we find antagonistic media that at the same time have potentials to advance emancipation and domination. In capitalism, the media always to a certain degree have a repressive character: They sell commodities and distribute ideologies. But the media also have potentials for alternative organisational forms and the distribution of critical content. Such potentials often remain marginal. They do not automatically come into existence, because alternative media face structural inequalities in the capitalist media system. Only social struggles can improve the structural conditions that can help realise such potentials of alternative media. Media and communication are embedded in society's totality and therefore also within social struggles. We need to decentre the media, which means that technological determinism and a neglect of the influence of society on the media should be avoided.

---

[8] Stuart Hall. 1973. *Encoding and Decoding in the Television Discourse. Birmingham Centre for Contemporary Cultural Studies Stencilled Occasional Papers #5.* Birmingham: University of Birmingham.

Alternative media question the capitalist organisation of media production, organisation, content, distribution, reception and structures. Table 14.2 provides a summary of the model outlined in table 14.1. Table 14.3 provides another version, where the dimensions are ordered a bit differently.

Table 14.1: Potential dimensions of traditional and critical media.

Dimension	**Capitalist Media**	**Alternative Media**
Media production	**Elite media producers:** journalists and other media producers as a professional wage-labour class that is confronted with corporate and political pressures, media production is conditioned by power	**Citizens' media producers:** independence of media production from corporate and political influences and pressures, true journalistic freedom, ordinary citizens as journalists and media producers, citizen-controlled journalism, individuals or groups that are affected by certain problems become journalists/producers or at least the positive subject of reports, journalistic practice as part of protest movement praxis, consumers as producers (prosumers), active audiences
Media product structures	**Ideological Form and Content:** content is strictly defined by what is considered as popular and sellable. The drive for profit can result in a lack of qwuality, complexity, and sophistication (as e.g. the case in Yellow Journalism that simplifies reality and is focused on singular examples, emotionalism, and sensationalism). Content takes on an ideological form either by the manipulative reporting of reality or by reporting stories as important that aren't really important for society at large. In any case, such content aims to distract the recipients from confrontation with actual societal problems and their causes.	**Critical Form and Content:** oppositional content that provides alternatives to dominant perspectives that reflect the rule of capital, patriarchy, racism, sexism, nationalism, etc. Such content expresses oppositional standpoints that question all forms of heteronomy and domination. Forms of counter-information and counter-hegemony include the voices of the excluded, oppressed, dominated, enslaved, estranged, exploited. One goal is to give voices to the voiceless and media power to the powerless, as well as to overcome filtering and censorship of information by corporate information monopolies, state monopolies, or cultural monopolies in public information and communication. There are forms of presentation that are not one-dimensional, but that make demands of the recipients and challenge them in order to advance their imagination and complex, critical thinking (e.g.Brecht's concept of dialectical form in epic theatre, radical discontinuities that shock people).
Organisational Media structures	**Hierarchical media organisations:** organisational media structures: Capitalist media corporations that aim primarily at making profit, financed by selling content to audiences and/or by advertisements. There is private ownership of media corporations and there are hierarchical structures with a clear power differential that creates influential decision-making actors and less influential roles as well as a division of labour within media organisations.	**Grassroots media organisations:** there is collective ownership and inclusive decision-making by those who work in the organisation, symmetric power distribution and economic self-management. There is a focus on non-commercial, non-profit media that are not financed by advertisements or commodity sale, but by donations, public funding, private resources, or no cost strategies. The division of labour is sublated: the roles of authors, designers, publishers, printers and distributors overlap.

Dimension	Capitalist Media	Alternative Media
Distribution structures	**Marketing and public relations:** high-tech distribution, marketing and public relations departments, specialists and strategies, sales departments, advertisements, distribution contracting.	**Alternative distribution:** technologies that allow easy and cheap reproduction, strategies like anti-copyright, free access (open access), or open content allow content to be freely shared, copied, distributed or changed. Furthermore, there are alternative distributors or alternative institutions (e.g. alternative book stores or libraries) that focus on the distribution of alternative titles.
Reception practices	Manipulated reception: content is interpreted in ways that contribute to false consciousness	Critical reception: content is interpreted in ways that allow the recipients to question domination

Table 14.2: Potential dimensions of traditional and critical media.

Dimension	Capitalist Media	Alternative Media
Media Production	Elite media producers	Citizens' media producers
Media product structures	Ideological form and content	Critical form and content
Organisational media Structures	Hierarchical media organisations, commodity form	Grassroots media organisations with collective ownership
Distribution structures	Marketing and public relations	Alternative distribution
Reception practices	Manipulated reception	Critical reception

Table 14.3: Characteristics of alternative and capitalist media.

		Capitalist media	Ideal alternative media
Media Structure	Economic form of media products	Media product as commodity	Non-commercial media product, non-profit
	Content of media products	Ideological content	Critical content
Media Actors	Consumers	Many consumers	Critical consumers
	Producers	Few producers	Critical producers

In elite media production, there are journalists and other media producers who are wage-workers. They face pressures from corporations and political organisations. Power shapes and influences media production. Professional media workers also have their own professional ethics and often compete for the accumulation of status. In citizen media, the producers are independent from the power of corporations and political organisations. Everyday citizens can become media producers. Citizens and workers control the media organisations. Those affected by society's problems are present in media reports and content. And they themselves can act as media producers. Alternative media are also often part of social movements. In alternative media, consumers are producers of the media.

Traditional media often produce and disseminate ideology. The published content is mostly shaped by sales perspectives. Commercial media's profit orientation can result in oversimplified, low quality and one-dimensional content. So, for example, tabloid media often simplify reality and use sensationalism. Media content is ideological if it distorts reality or focuses

on issues that are presented as important, but distract attention from the focus on problems that are truly relevant for society.

Critical media's content and form are critical. Its content challenges domination, exploitation, capitalism, patriarchy, ideology, racism, sexism, nationalism, etc. Such critical counter-hegemonic information expresses the voices of those who are alienated, exploited, oppressed, enslaved, or excluded. Critical media give voice to the voiceless. They provide communication power for the powerless. They aim at overcoming the censorship and filtering of communication brought about by information monopolies controlled by corporations, the state or cultural organisations. Critical media question one-dimensional forms of presentation. They use forms that enhance complex thought and imagination. An example is Brecht's dialectical, epic theatre.

Capitalist media yield profit by selling access, advertising, content, or technologies as commodities and exploiting communication labour. Such media corporations are privately owned and have a division of responsibilities and labour so that some take all the important decisions and others merely execute labour based on these decisions.

Grassroots media are organisational alternatives to capitalist and hierarchical media. Such organisations are collectively owned; they operate by participatory decision-making, which means that those working in the organisation take collective decisions. Such organisations are forms of economic self-management, where power is more symmetrically distributed. Grassroots media are not-for-profit and often do not sell advertisements or other commodities, but rely on donations, public funding, private resources, low-cost-strategies or no-cost-strategies. There is no rigid division of labour in grassroots organisations; the roles workers have overlap.

Traditional media use marketing, public relations, advertising, branding and high-tech in the process of distribution. Alternative media are open to different strategies, including low-tech and DIY technologies, open access and open content, anti-copyright, free access, etc. There are also alternative distributors that focus on the distribution of critical media. Examples are radical publishers and alternative book stores.

In the reception of information, critical and manipulated reception are two of the ways in which audiences interpret content. Manipulated reception means forms of interpretation that help to create or reproduce false consciousness. In contrast, critical reception means that content is interpreted in ways that make audiences question exploitation and domination. An interpretation of form or content is critical if the audiences are empowered to develop ideas about how to foster a co-operative society.

The models shown in tables 14.1, 14.2, and 14.3 describe ideal-type alternative media. Under ideal conditions, all of the dimensions of alternative media can be realised, including self-managed organisations, and widely available and widely consumed critical content that is critically interpreted and brings about change in society, including animating citizens to become alternative media producers. Ideal-type alternative media work best under conditions that provide citizens with the resources, time, and skills needed for them to participate in the public sphere. If critical media flourish under such conditions, then the division between media production and media consumption disappears. Grassroots media then become the standard form of media. Such conditions cannot be created within a capitalist society, but

rather require the creation of a society of co-operation and the commons that is governed in the form of a participatory democracy.

Prefigurative politics assumes that alternatives to capitalism can already be established within capitalism. Prefigurative politics also believes that within a capitalist framework, alternatives can operate relatively autonomously from capitalist structures. Alternative media, however, often face the problem of resource precarity and voluntary, self-exploitative, precarious labour. This type of media should therefore not be idealised. Self-managed organisations are not always politically progressive. It is perfectly possible for self-managed media to advance fascist or other repressive contents. A communication system must at least have critical content or critical form in order to be an alternative medium. In cases where audiences critically interpret repressive content published in traditional media, one cannot speak of alternative media, only of alternative reception. Certain parts of mainstream media can at times have critical content. The minimum condition for defining a medium as critical is that it is a critical product. But of course, it is desirable that as many dimensions of alternative media as possible can be realised. In capitalism, it is, however, difficult to reach all of these desirable aspects of alternative media. If one rigidly focuses on all dimensions, then one assumes that an alternative society can already be created within capitalism without abolishing structures of exploitation and inequalities. Citizen journalism, self-managed organisation, alternative distribution channels, and critical reception practices are desirable, but not necessary, features of alternative media. Critical content and critical form *(= critical media products)* constitute alternative media's necessary features. Alternative media are critical media.

Types of Critical Media

By using the method of advancing from the abstract to the concrete, we can identify subtypes of critical media. We will now introduce a typology that presents different forms of critical media (see table 14.4). The typology is based on the following questions: (1) what parts of the body are predominantly used in media production and reception; (2) is communication synchronous or asynchronous; (3) does communication take place spatially over a distance, or in the presence of the other communicators.

Table 14.4: A typology of alternative media.

Communication	**Production**	**Reception**	**Formats**	**Time**	**Space**	**Alternative Media**	**Examples**
Print/visual communication	Brain, hands	Brain, eyes	Newspaper, journal, books, pamphlets, leaflet, comics, satirical prints, flyers, visual art, graffiti, dress, textiles, pins, buttons, stickers, murals, etc,	Asynchronous	Distance	Alternative press, critical art	Jacobin, Mother Jones, Oz, Bay Guardian, The Nation, Le Monde Diplomatique, New Statesman, Fifth Estate, Class War; Duane Hanson, Joseph Beuys

Communication	**Production**	**Reception**	**Formats**	**Time**	**Space**	**Alternative Media**	**Examples**
Audio communication	Brain, mouth	Brain, ears	Radio, telephone	Synchronous	Distance	Free radio, independent radio, com- munity radio, pirate radio	Pacifica Radio Network, KPFA Berkeley, KPFK Los Angeles, KPFT Houston, WBAI New York, WPFW Washington DC, National Federation of Community Broadcasters, Grassroots Radio Coalition
Audio communication	Brain, mouth, body	Brain, ears	Face-to-face communication, Conversation, talks, lectures, singing songs	Synchronous	Presence	Radical singing, protest singing	'Oh, freedom' (abolitionism), 'We Shall Overcome',
Audio communication	Brain, mouth, body	Brain, ears, body	Concerts, choir, dancing	Synchronous	Presence	Alternative music concerts, protest song concerts	Alternative music, recorded protest songs
Audio communication	Brain, mouth, body	Brain, ears, body	Sound recordings (records, music cassettes, CD, MP3, etc)	Asynchronous	Distance	Alternative music, recorded protest songs	Mogwai, Godspeed You! Black Emperor, Billy Bragg, Robert Wyatt, 'The Preacher and the Slave' (Joe Hill, socialist), 'Bombtrack' (Rage against the Machine, social justice), 'Sound of Da Police' (KRS- One, anti-racism), 'Kill the Poor' (Dead Kennedys)
Audio-visual communication	Brain, mouth, body	Brain, eyes, ears	Theatre, performance, happening	Synchronous	Presence	Critical theatre	Youth International Theatre (guerrilla-theatre), Brecht's epic theatre
Audio-visual communication	Brain, mouth, body	Brain, eyes, ears	Film, video	Asynchronous	Distance	Critical television, independent cinema, underground film, avant-garde film, amateur videos	*Democracy Now!*, *Crash* (Paul Haggis, 2004); films by Jean-Luc Godard, Rainer Werner Fassbinder, Andy Warhol
Audio-visual communication	Brain, mouth, body	Brain, eyes, ears	Live television	Synchronous	Distance	Public access television	Manhattan Neighborhood Network

Communi-cation	**Produc-tion**	**Recep-tion**	**Formats**	**Time**	**Space**	**Alternative Media**	**Examples**
Multi-media, computer, Internet communi-cation	Brain, hands, mouth, body	Brain, eyes, ears	Digital text, digital audio, digital video, real time text/ audio/ video chat, online radio, online TV, wikis, blogs, Internet art, etc	Synchro-nous or asyn-chro-nous	Distance	Alternative online media	Novara Media, Young Turks, The Canary, Another Angry Voice, Indymedia, Alternet

Given that critical form and critical content are decisive for the alternative character of the media, one cannot argue that all community-produced, non- commercial, 'free', independent, self-managed, self-organised, etc. media are alternative, although many of them are because they feature critical content. They are more likely to be critical than conventional media, but they are not automatically critical.

The key feature on which the typology is built is the notion of critical products that have critical content and critical form. Alternative media, like critical media, are critical products, which means that they have critical form and/or critical content. There can be critical form without critical content and vice versa. Critical form and critical content can also occur together. In artworks such as films, music, concerts, literature, theatre, visual arts or digital arts, form is of particular relevance. Art exists through is aesthetic appearance. It is critical if it is non-identical with society and strengthens imagination. Its content is therefore not directly critical. Art's critique lives through its form and art's non-identity with society. But there is of course also critical political art that not only works at the level of form, but also at the level of content that is directly critical of domination and exploitation.

Summary and Conclusions

We can summarise this chapter's main conclusions:

- There is no pre-defined role of communication technologies in social struggles. Because capitalism is an antagonistic society, communication technologies often have an antagonistic role in this society.
- There are potentials for alternative media as critical media to challenge the capitalist organisation of the communication system. Providing access to critical forms and critical content is one of the foundations for critical debate, critical engagement, and critical consciousness.
- Critical media and the use of communications as tools of emancipatory struggles are forms of praxis communication.
- Alternative media face certain structural limits in capitalist society. The history of alternative media is a history of resource precarity and voluntary, self-exploitative labour. Alternative media therefore need to be complemented by public service media as alternatives to capitalist media. Alternative media require public sources of funding in order to be able to constitute a strong counter-public sphere.
- In capitalism, the class struggle is not only between capital and labour, but in the realm of communication also between capitalist media on the one side and commons-based, alternative, critical, and public media on the other side.

- Strengthening critical media must be part of any progressive political agenda.

CHAPTER 4

What We Talk About When We Talk about "Media Independence"

Karl Karppinen and Hallvard Moe

Javnost—The Public 23, no. 2 (2016): 105–19. https://doi.org/10.1080/13183222.2016.1162986.

Abstract

Media independence is a contested concept that carries different meanings in different contexts. As a normative ideal, independence can be discussed on many levels, and media organisations, journalists, researchers and regulators often invoke the term in contradictory ways. In contemporary European media policy, the conceptual contestation over the meaning of independence has been further reheated by commercial media's attempts to reframe the distinction between commercial and public service media as a choice between "independent" and "state" media. The digital transformations and the emergence of new media actors and platforms also challenge the meaning and relevance of different conceptions of media independence and dependence. In this article, we discuss the changing uses of the notion of independence in current media policy discourse, including controversies between public service and commercial media, but also other settings where the notion is invoked. We then develop a more fine-tuned understanding of the different dimensions that media independence contains in a contemporary media environment. Finally, we discuss how the relational nature of independence makes it problematic to employ as a normative principle in media policy.

Keywords

media independence, media policy, transparency, journalism, public service broadcasting

CC BY

Introduction

Independence is a central normative principle in media policy and journalism. It is also a controversial term that carries different meanings and connotations. Media independence is discussed among media industries, activists, journalists, researchers and regulators from varying perspectives. In different contexts, including debates on the position of media in authoritarian societies, the status of European public service broadcasters and "indie" media, different actors understand independence differently. By declaring independence—from state control, market forces or mainstream conventions—media organisations and actors seek to bolster their legitimacy and credibility in the eyes of audiences, peers as well as policy-makers. At the same time, however, as a concept, media independence gets increasingly difficult to pin down.

None of this is news. Independence is an "essentially contested concept", inherently subject to endless revisions and interpretations (Gallie 1956; Karppinen and Moe [2013, 2014] for related discussions of "media governance" and "media markets"). Like other key concepts in political thought, its meaning cannot be settled by logic only. The tug of war over the meanings of media independence is at least as old as the idea of press freedom. Yet in the context of European media policy, the conceptual contestation over the meaning of independence is topical because of two tendencies. First, at both European and national levels, commercial media actors have actively sought to reframe the distinction between commercial and public service media as a choice between "independent" and "state" media. Second, the digital transformations and the decline of legacy media organisations have given rise to new actors as well as new aspects of control and dependence. As a consequence of these transformations, the traditional line between journalism and advertising, for example, has increasingly become blurred by new forms of sponsored content. Furthermore, the increasing power of multinational news aggregators, search engines and social networking sites has also reheated the question of what we mean by media or journalistic independence.

Nick Couldry (2009) among others has argued that the technological, social and political dynamics of the current digital transformations are undermining our sense of "the media" as a privileged site for accessing a common world. For some, these changes mean the obsolescence of traditional media, as a detached institution with its own established professional codes and organisational forms, and their replacement with new models of collaborative and participatory communication.

In this context, the notion of media independence—like other core values of the "high modern" journalistic ethos (see, for example, Hallin 2006)—is now increasingly contested and even put into question. For many of the new actors that now produce journalism, including citizen initiatives, lone individuals or think tanks, independence might simply not be as relevant as other normative values, such as transparency, diversity or participation (McBride and Rosenstiel 2013). So is media independence just one of the mantras that legacy media organisations repeat, hoping it would bring them back to relevancy, even though its meaning remains vague and the practices it refers to are increasingly becoming irrelevant?

In general terms, independence refers to an absence of external control. Independence means freedom from the influence of others, but also describes the capacity of an individual or institution to make decisions and act according to its own logic. As a normative principle,

independence can be debated on different levels, and linked to a variety of frameworks and discourses. On the level of general social theory, independence can be traced back to modern society's functional differentiation of various spheres or fields of social life, discussed in classic sociological works from Weber to Bourdieu. In such contexts, independence relates to autonomy; self-government or the right of an institution to make its own rules and administer its own business. Following the deliberative turn of democratic theory (for example, Bohman 1998), the notion of media independence as a normative principle has often been linked to the Habermasian ideal of the autonomy of the public sphere from the systemic forces of state and economic power. As Habermas (2006, 411) put it, "mediated political communication in the public sphere can facilitate deliberative legitimation processes in complex societies only if a self-regulating media system gains independence from its social environments".

Here, independence is also closely intertwined with other basic ideals of the liberal-democratic understanding of media's role in society, such as freedom of the press, critique of power, media as the fourth estate and journalists' watchdog role. These positive connotations of the term make media independence an attractive idea for both those who assess the functioning of the media and for media organisations themselves to gain credibility. As James Bennett (2015, 2) argues, "media independence functions as a utopian vision of the media's role in society for those who regulate it, own it, work within it and even study it".

This article aims to discuss the changing uses and contexts of media independence, and to scrutinise its value in media policy. We first review some of the different uses of the notion of independence in current media policy discourse, starting with controversies over public broadcasting and then moving beyond that to look at uses in other settings. On that basis, we develop a more fine-tuned understanding of the different dimensions the notion contains in a contemporary media environment. Finally, we discuss how the relational nature of independence makes it problematic to employ as a normative principle in media policy. We argue that, even though it fails to provide a neutral yardstick for assessing all types of media, the concept continues to serve a role as a normative ideal in many media policy debates.

Conceptual Contestation in European Media Policy

The meaning of media independence as a normative value clearly depends on the context in which it is used. Many of the established discourses and connotations around the term can thus be traced back to specific historical and cultural contexts where media organisations have purposefully used the notion to legitimise their position. In countries with a politically aligned press, for instance, party papers' attempts to declare independence from historical party political affiliations can be seen as part of a strategy to widen their readership from specific political segments to a mass audience (see Hallin and Mancini 2004, 26–27). Similarly, other types of media organisations' interpretations of independence are always tied up with their own strategies of distinction.

Besides newspapers, public service broadcasting has traditionally been one of the central contexts where the notion of independence has been employed as political and normative value. Ever since the institutionalisation of the idea of broadcasting as a public service, the

independence from the state, on the one hand, and commercial competition, on the other, has been a central concern in European broadcasting policy.

The ideal of independence can be found, in different forms, among the values and guiding principles of most European public service broadcasters. The Royal Charter of the BBC (2006), for example, states that "The BBC shall be independent in all matters concerning the content of its output, the times and manner in which this is supplied, and in the management of its affairs" (§6). Similarly, the statutes of the Norsk rikskringkasting (NRK) require that "NRK shall have editorial independence. NRK should guard its integrity and credibility in order to act freely and independently in relation to persons or groups who for political, ideological, economical or other reasons wish to influence the editorial content" (NRK-plakaten (2014) http://www.nrk.no/informasjon/nrk-plakaten-1.12253428, §12d, accessed 30 March 2016).

Importantly, however, the specific arrangements set up to facilitate independence have differed widely. Consider West Germany after the end of World War II as an example: while the British in the early 1920s, and later other European countries, opted for a national service, in 1945 each of the Allied occupants set up broadcasting services in their respective sectors of West Germany. The occupants all sought to steer radio and television away from the clasp of private actors, the state, politicians and other sectional interests. They were influenced by the British model, but they all decided on a decentralised solution in keeping with the general administrative and economic structure they were imposing (Humphreys 1994, 128–129; Lucht 2006, 96ff). This lay the foundation for the regional broadcasting system still in force in Germany, a design inherently meant to foster independence from undue political influences.

In practice, public service media in different countries and contexts have struggled to retain their real (political) independence with different means and results. The public media systems in Germany and Nordic countries, for example, are generally considered to enjoy strong *de facto* independence, while in many other places (e.g. in southern Europe, the Netherlands, Australia and New Zealand) the procedures for assuring autonomy from governmental control have been seen as increasingly threatened (see, for example, Benson and Powers 2011; Hanretty 2010). Despite different institutional arrangements and their varying success in fostering independence in practice, in scholarly debates public service media have still been regarded, at least in principle, as the institutional space that best approximates the Habermasian ideals of autonomy from both state and commercial pressures (for an overview, for example, Garnham 1986, 1992; Moe and Syvertsen 2009).

In recent years, the debates between public service broadcasters and their commercial competitors over the status and remit of public service media around Europe have re-highlighted the contested nature of the concept. What seems new in recent European media policy debates is that commercial media actors across Europe have systematically attempted to reframe media policy debate by referring to public service media as "state media" and to themselves as the "independent" or "free" media. At the European level, the European Newspaper Publishers' Association, for example, has consistently employed the distinction between the "independent press sector" or "free and independent press" and public service media as "state media" (for example, ENPA 2016). The insinuation is clearly that the main danger to media independence lies in undue state inference or public funding, and that public service media are, by their very nature, less independent and more susceptible to outside political pressures than market-based media outlets.

This line of argumentation has also been widely adopted by national media industry lobbyists. In Germany and Finland, for example, the advocates of private media industry objected to the new tax-based funding system of public service media on the grounds that it would threaten the operating conditions of the "independent media sector" and thus decrease genuine diversity and pluralism in the media (Herzog and Karppinen 2014). What counts as genuine diversity and pluralism, of course, is another example of conceptual contestation in media policy (see Karppinen 2013). Here, it clearly refers more to a market-driven definition of diversity as consumer choice, rather than the more complex ideas of social, cultural and political pluralism that the European public service media have historically advanced.

The independence of media—publicly funded media in particular—from politicians and the government is clearly a relevant aspect of media independence. It is only one such aspect, however. The rhetorical distinction between state media and independent media says nothing about other forms of external control or influence over journalism, such as advertising, media ownership and public relations.

The selective uses of independence in European media policy debates thus reflect the value of the notion as a means of news media organisations' political lobbying and strategic communication (see, for example, Brüggeman, Esser, and Humprecht 2012). In the face of digitalisation, new actors and the disruption of traditional competitive dynamics of media markets, legacy news media, including both public service broadcasters and newspapers, have gradually lost the unquestioned, unchallenged status of "a fact of nature" in the digital age (Couldry 2009, 447). As a consequence, they increasingly need to legitimise and reaffirm their position in the eyes of both audiences and media policy-makers.

The centrality of independence in the strategic communication and lobbying of media organisations can be seen as a way to distinguish them from other types of media; in this case, private media from public service media, but more broadly also from other actors that compete with mass media, such as social media and blogs. Alongside other notions such as quality, freedom and diversity, independence offers a central keyword in these efforts. The interest of different types of media varies, and so their rhetorical strategies also emphasise different dimensions of independence. While the rhetoric of private media industry systematically articulates independence with the context of state funding and government influence, the defenders of public service media tend to emphasise independence from advertising, media owners and other external economic and social interests.

It is important to note that different meanings and framings associated with politically contested notions, such as media independence, do not emerge spontaneously. Instead, media organisations and their interest groups often employ calculated discursive strategies to influence the framing of public and political discourse (see Brüggeman, Esser, and Humprecht 2012).

To be fair, a critique of public service media's political dependence has some merits in various contexts. Comparative work on the relations between political systems and media systems has shown how ways in which independence are operationalised and governed vary between countries (for example, Hallin and Mancini 2004).

In some countries the public broadcasting institutions were deliberatively set up as extensions of pillars of society so that radio and television channels came to closely represent pre-defined social groups, religious or political strands. The Netherlands would be a prime example. Elsewhere, such political parallelism was less of a deliberative design than an unwanted

end result of the public service media system. An often-discussed instance of this would be the Italian system (for example, Hibberd 2001). In yet other places, the organisation of public service broadcasting, and media more generally, included an institutionalised distance from the state. This kind of institutionalised distance from the state is often referred to as "the arm's length principle" (the following builds on Moe and Mjøs [2013]).

In a broad sense, the arm's length principle is "implicit in the constitutional separation of powers between the judiciary, executive and legislative branches of government" (Hillman-Chartrand and McCaughey 1989, 43). More specifically, the principle is often linked to cultural policy, where a system for funding was established after World War II in many countries (Mangset 2009, 276). In these set-ups, the governmental branch—for instance, a Ministry of Culture—is "facilitative not executive, so influence is exercised through setting broad policy and audit guidelines", while "non-departmental public bodies operate and implement policy" (Taylor 1997, 449–451). In effect, then, the arm's length principle entails delegating both the decisions and the contracting of a service, such as cultural activities, including the media. The idea is to institutionalise independence. "Independent regulatory authorities" of the media, found in Europe, represent such an institutionalisation of the arm's length principle in media policy.

Laid out in this manner, the principle might appear uncontroversial. However, this is not the case, as illustrated by, for instance, cultural policy in France. Here, an active government agency has tended to intervene in cultural life by prioritising tasks, distributing funding and initiating projects (for example, Andrault and Dressayre 1987). This is mirrored in the actual governance of the media, such as in public service broadcasting regulations, where historically political interests have also reached within the organisation of the public broadcasters and media institutions more generally—much in line with what Hallin and Mancini described as the "Mediterranean or polarized pluralistic model" (2004, 106).

But even if we zoom in on a region of the world where the arm's length principle is applied in media policy, such as the Nordic region, the actual success of institutionalising independence differs over time and across systems (Moe and Mjøs 2013): the measures taken to hinder political appointments in public service broadcasting institutions, for instance, have not always been taken for granted. It was not until 2001 that the Norwegian NRK got a Director General with a political background from the political right, rather than the left. A similar pattern can be found elsewhere in the Nordic region: the current head of the Finnish Yleisradio (Yle) appointed in 2010 was the first director in 40 years to not come from the Social Democratic Party.

The nuances of independence in public and private broadcasting regulations are interesting in their own right. From a broader perspective, however, both public and private media tend to employ the notion of independence in a very selective manner. If we look beyond the context of European public service broadcasters and traditional newspapers, we see how the notion of media independence has many histories and is used differently in various contexts.

Beyond Public versus Private Media

Public service media and commercial broadcasters or newspapers are not the only media outlets that have a claim on the term independence. Especially with new digital actors, the potential meanings of the term have multiplied.

Besides signifying independence from the state or business interests, independence can also mean distance from the mainstream conventions and the prevailing powers of the media industry itself. Often associated with the term "indie", the notion of "independent media" is used to refer to alternative, often non-profit or subversive media outlets. This label has also been picked up by many online activist, alternative and citizen media formations. Indymedia,[1] a media network established in 1999 associated with the broader global justice movement, for example, refers to "independent media" as grassroots, non-corporate and radical. In this sense, independent thus comes close to what has been called "alternative media" (Bennett 2015, 10–11). Similarly in the domain of film and music, independent has often meant a particular aesthetic style and creative distance from the mainstream or major corporations (for example, Hesmondhalgh 1999).

In comparison with the policy debates between public service media and commercial media around Europe, a distinct understanding of independence comes into play here. In addition to independence from the state authority and/or commercial interests, independence also refers to a particular way of doing things that is an alternative to the mainstream media and its logic. As opposition within the media industry complex, independence thus comes to mean distance from "the mainstream", which is seen as reflecting conventional or mass tastes and restricting creative freedom. If the mainstream media presents itself as independent because it follows its own logic of journalistic culture, for other independent media the same term means freedom from that very notion of mainstream journalistic culture. Instead of non-commitment or detachment, independent or indie, then, can also mean radical politicisation, orientation to social justice or political commitment.

In the digital era, independence can also refer to new voices and forms of journalism that are financially independent from the "legacy" media industry, such as social news or crowd-funding initiatives (Hunter 2015). Distance from institutional and corporate constraints of legacy media can be seen as empowering audiences and communities and allowing stories to be funded that would otherwise not be covered. At the same time, however, it can be argued that the precarious nature of such work and the lack of institutional support mechanisms of large media organisations renders these new forms of digital journalism even more vulnerable to outside pressure from funders or other special interests (Hunter 2015).

Another related use of the term is "independent producers", which, in European audio-visual media, is used for private television production companies who make programme content for broadcasters. For these companies, "independence" signifies distance in ownership from a certain other kind of media institutions, not dependence on the state or other external forces. Equally importantly, however, the independent producers are assumed to make content that differs from the traditional broadcasting institutions—or at least that is implied in EU directives which require certain percentages of broadcast content to be made by the so-called independent sector. But just as close scrutiny of broadcasting regulations

[1] See indymedia.org (accessed 30 March 2016).

uncovers discrepancies from the normative ideal of independence, so does a closer look at the sector of audiovisual media labelled "independent" reveal large, well-established actors owned by conglomerates clearly representing the mainstream.

With the emergence of the Internet as a media and communication platform, another layer of complexity has been added to media independence. Audiences are spread over a larger territory, and the advertising market became much more complicated on the Internet (for example, Turow 2012). The regulators are not contained within the clear boundaries of nation-states. Still, in principle, providers of media content answer to market forces and regulatory bodies in the same way traditional media providers do.

What makes for the complexity is perhaps the hyperbole surrounding online media (for critical perspectives, for example, see Fuchs 2014; Curran, Freedman, and Fenton 2012; van Dijck 2013). As illustrated by speeches and manifestos like the Declaration of the Independence of Cyberspace by John Perry Barlow (1996), the promises commentators and industry actors find with the Internet seem greater than with new media technologies in the past. For many, the Internet, or specific services such as social media, harbours the potential to create a radically different media environment. The massive information available through search engines coupled with how easy it is to speak up in public could make us think the Internet provides media independence of a new kind.

Yet the possibilities go hand in hand with limitations: we now pay for our communication services by giving up metadata and data about ourselves and our everyday lives (van Dijck 2014). This has revitalised discussions of privacy and made more people attentive to issues of anonymity online (see, for example, Bartlett [2014] on the problematic aspects of online anonymity). Native advertising and other practices online that blur the line between journalism and sponsored content have also been seen to threaten the fundamentals of journalistic independence (Piety 2015). The power of new gatekeepers, such as search engines and social media platforms, to influence what people see and do not see online constitute new algorithmic or computational dependencies. Taken together, the growth of online media is obviously a key factor that forces us to reconsider the meaning and relevance of media independence.

While different uses of independence discussed here matter across borders, we should not ignore the relations between media independence and the political system and culture that lie within. Just as the current European debates on the independence of public service media are closely tied with specific national political cultures and media systems, and by no means cross-culturally generalisable, the term indie and its connotations are strongly rooted in western popular culture and its institutional and aesthetic traditions. Thus, if media independence is a contested concept in European-level media policy debates, its meanings are even more varied in different media systems and political cultures.

In authoritarian regimes, the term can be used to refer to mere pseudo-freedom. Based on cross-national comparison, Daniela Stockmann (2013) argues that media independence in various authoritarian regimes does not directly follow from the introduction of market forces into previously state-controlled media systems. Instead, the meaning and reality of "independence" and its threats vary greatly between different political regimes and media systems. For instance, a number of "non-official" or "independent" media outlets have been formed in China over the past years. In this case, the label does not mean that these media would be any freer from state censorship than state-owned media. Instead, these outlets use

independence as a label that serves to make them more credible in the eyes of the audiences, which in turn actually improves their efficiency as a tool for state propaganda (Stockmann 2013). Similarly, ideas of media and journalistic independence in Russia have not followed a linear path envisioned by many after the fall of the Soviet Union. Rather, the realities of media independence have been inseparable from the complexities of the political and economic and cultural environment of the country (Rodgers 2015).

Given its varying meaning, then, how can we go about separating and sorting the different dimensions of media independence?

Independence from What, for Whom and by What Means

So far, we have argued that independence is a central rhetorical means for legitimation purposes for various types of media in different contexts. Based on its changing uses, it is clear that media independence is a relational concept. We must always ask by whom and for what purpose it is invoked (Bennett 2015). A relational concept has no essential content; there is no such thing as total or absolute independence in the realm of media. Instead, any media will always have to deal with a multitude of different types of constraints and external influences. Which of these are regarded as the most pertinent, or politically relevant, inevitably depends on the context.

We can heuristically separate these different uses by analysing whose independence, from what and by which means it is that we talk about. On this basis, we can suggest an initial, non-exhaustive typology of different aspects of media independence, listed in Table 1.

Table 1 Aspects of media independence

Whose independence?	**From what?**	**By which means?**
Media system	State/government	Law and statutes
Media organisations	Political parties	Organisational arrangements
Journalism	Special interest groups	Self-regulation
Individual voice/speaker	Market forces	Ethical guidelines
	Major media corporations	Professional culture
	"The mainstream"	

The first column in the table describes who the independent entity is. At the broadest level we can talk about the independence of a media system as a whole, either as a theoretical construct or when comparing different national media systems. Media organisations are the institutions and outlets for media production. These range from established media businesses and public institutions, to less obvious candidates such as telecom companies or online platforms. Journalism can be defined either broadly, encompassing a profession or a culture, or more specifically, as journalistic practices or products. The final entity that can enjoy more or less independence is the individual speaker. This category incorporates journalists, but also actors such as bloggers or citizens participating in public debate.

The second column presents social forces, from which these entities can be deemed more or less independent: the state or government; political parties or interests groups (cf. political

parallelism); market forces or commercial interests; and the mainstream, typically understood as aesthetics, tastes and cultural conventions associated with popular media culture.

While all these forms of independence matter, they can be fostered by a variety of different formal and informal means. In many settings, a constitution lays down basic measures for media independence (e.g. in the form of press freedom paragraphs or freedom of speech more generally). In some systems, the roles of specific media institutions find their definitions in the constitution or in interpretations of it. German public service broadcasting, for instance, is understood to get its remit from the basic law's (*Grundgesetz*) provisions of freedom of opinion and information (for example, Humphreys 1994). Elsewhere, specific acts or statutes cover specific media (such as broadcasting or audiovisual services), specific media regulatory provisions (such as must-carry rules for television) or specific institutional requirements. Laws governing public service broadcasters, for example, typically mention independence as a general guiding principle, but also stipulate more specific organisational arrangements concerning, for example, funding, appointment procedures or external supervision. Within media organisations, independence can also be fostered with other organisational arrangements, such as the separation of the editorial and advertising departments.

Independence can further be anchored in the form of self-regulation or professional guidelines. Ethical guidelines for journalists typically include independence from external influences as a central ethical principle. Individual media organisations or self-regulatory bodies can also issue their own rules or recommendations on journalists' professional status or, for example, gifts or benefits that might compromise journalist's independence. Beyond such formal recommendations, the ideal of journalistic independence is more informally embedded in the self-understanding and everyday practices of journalists almost universally (Reich and Hanitzsch 2013).

Whereas established media organisations might have a legally defined independence, along with a long history that gives precedent when it comes to manoeuvring issues of independence, many emerging actors might not. Importantly, formal does not necessarily equal better, or even well functioning: the independence of journalism as a profession is formally laid down in professional guidelines, statutes, ethical manifests and, in many cases, also laws. Still, the actual functioning of journalistic independence depends on a range of factors, and can be assessed not only based on the prescriptive definitions but more importantly based on actual performance (for example, Trappel, Nieminen, and Nord 2010; Syvertsen et al. 2014).

The categories are clearly not mutually exclusive: a journalist would ideally be independent from state and also commercial interests, and subject to laws, professional guidelines as well as her own ethical beliefs. One could thus draw lines between relevant entities in different columns, depending on the specific case in question. While these aspects are by no means exhaustive of all the different contexts in which media independence may be brought up, what Table 1 helps us do is distinguish between different levels of independence, and how they can work individually or in unison.

It is also important to note that actors can influence independence in different roles: the state can be a media owner but also a media regulator. The state can pose a threat to independence by various means of censorship or through the exercise of its monopoly on the use of force, something which to a saddening extent remains a problem in many parts of

the world. Similarly, business actors can act as media owners and as employers of individual journalists, but also, for example, as buyers of advertising or content.

To sum up, laying out the different meanings, uses and contexts of media independence helps us sort out and explicate whose independence we are talking about, what they should be or are independent of, and by which means. This makes it easier to connect different claims and assess actual independence in specific debates. For the current claims of independent versus state media in Europe, for instance, the distinctions make it easy to see that the commercial companies downplay their dependence on the market, while simultaneously overemphasising the relations between public service broadcasters and the state or political parties.

Such an explication clearly only goes so far: it cannot "solve" the inherently controversial nature of the concept of independence. The meaning and relevance of independence always depend on the setting. In specific contexts, the notion is clearly useful. Besides debates on the political independence of public service media, the influence of advertising or media ownership on journalistic content, for example, continues to be a relevant issue for critical media research. Independence also continues to be a central notion in studies of journalistic culture and its professional norms. Research on journalistic cultures across the world, however, reveals that its conditions, limits and perceived threats vary across countries (Reich and Hanitzsch 2013).

In these contexts, independence clearly continues to be a central principle and in each case we should try to single out what aspects of independence/dependence we consider relevant. But if independence is understood as a thoroughly relative concept that can be invoked by almost anyone for almost any purpose, does it have any value left as a general normative principle in media policy debates? Is there any common standard for evaluating which media are more independent, or do we need to assess them all against their own conception of independence?

Beyond Independence?

Independence can be seen as an example of a "high modern" journalistic principle that many regard now as increasingly irrelevant and unattainable. As Hallin (2006) has argued, the idea that journalism, as the fourth estate, could be truly independent of other institutions and rise above social divisions and contradictions to produce knowledge of universal validity was central to the "high modernism" of journalism. In a postmodern perspective, it is fashionable to instead emphasise subjectivity, relativism and the ubiquity of power relations within which all media and journalists operate.

It may even be questioned whether independence is always desirable. The notion of media independence is almost always understood positively. As already discussed, it has clear critical element associated with self-determination, critique and progress. Yet, at the same time, the notions of independence and autonomy can also be linked to negative associations, like apolitical isolationism, self-sufficiency, lack of commitment, false objectivity or "the view from nowhere" journalism (for example, Rosen 2010). It can be argued that true independence from all outside interests is neither possible nor desirable. All media are interdependent with their social environment and its power relations, and the idea that the media should only be guided by their own insular logic and normative codes is not necessarily even very appealing.

As we have argued, the digital media environment and its complex interdependencies have only underlined this impossibility of genuine or absolute independence. All this raises questions of whether media independence, as a normative value used to assess media organisations in society, should be replaced with other, more fashionable values, such as transparency, openness or diversity.

Kelly McBride and Tom Rosenstiel (2013), for example, have explicitly argued for replacing "act independently" with "be transparent" as a guiding ethical principle of journalism. When journalism comes from varied sources, and not only a homogeneous group of professionals working for established media organisations, they argue that "the concept of journalists as clearly independent of those they cover will be more complex" and, "as a principle, transparency will drive journalists to actions and accountability that independence did not" (2013, 2 and 4).

Amit Schejter (2007) has also called for the media consumers' "right to transparency", implying that the calls for independence should be judged in relation to the stated aims and purpose of different media organisations. Instead of only rhetorical declarations of independence, Schejter argues that the various types of media should openly disclose their loyalties and underlying interest, so that citizens can assess them in their own right. In current media debates, the emphasis on such transparency is prominent in many ways. The debates on native advertising (Piety 2015), for instance, often end up calling for disclosure and transparency, so consumers can clearly distinguish promotional content from editorial content. Similarly, debates on the power of algorithms and new forms of gatekeeping highlight the importance of "algorithmic accountability and transparency" (Diakopolus 2015). In other words, when algorithms increasingly influence our exposure to information, software companies should disclose the ways in which they work so that users can understand their influence.

Because of the difficulty to establish any universally recognised standards for evaluating "media independence", it can be argued that normative judgements regarding the media, whether they concern their structure or the content, have increasingly shifted towards emphasising transparency, diversity and openness. If no media outlet can claim to be truly independent or objective, then the best we can hope for, it seems, is that there is the widest possible range of different types of media available that users can openly evaluate.

Transparency, openness and diversity too, however, are notions that almost anyone can embrace. This can also make them somewhat evasive and vacuous, leading many to believe that they too are becoming catchwords with little critical content. Transparency and diversity do not themselves identify any specific values or objectives that need to be advanced or protected. The problem with replacing independence with these other notions is therefore that they too are equally vague and contested concepts. Transparency alone cannot resolve the problems associated with media structures and democratic regulation of the media any more than media independence can.

Conclusions

It is easy to criticise the notion of media independence for being unattainable and utopian, since no media outlet can truly claim to be absolutely independent. It is also clear that media independence is a concept that does not have a universal meaning. Instead, it can signify radically different, and often contradictory, ideals. As we have discussed, even in the specific

context of current European media policy, its meaning vary between sectors of the media and between different types of media organisations.

Besides this basic ambiguity, the concept of independence can be further criticised for its instrumental uses in political lobbying. The notion is increasingly used by various sectors of the media to promote their own agenda and bolster their own legitimacy against unwanted challenges. What Damian Tambini (2012, 1) has said about the abuses of the term "press freedom" also applies to "media independence": at its worst, "the term is increasingly used to protect the self-interest of one of many converging media sectors, to block reforms, and close down debate about the appropriate form of media accountability".

Does this entail that the meaning of media independence has dissolved with its many uses? We should be careful not to assume that the current period in the history of media policy is more complex than previous ones. Actors have undoubtedly differed in their uses of media independence in earlier periods, too. The fact that the meaning of a concept is ambiguous or contested does not necessarily make it irrelevant. Otherwise, we could argue that many other normative concepts, including media freedom and democracy, have also become irrelevant mantras. It might be that the critical potential of the term seemed more effective at earlier stages of media history, such as the introduction of public service broadcasting from the 1920s or the fading of the party press in the Nordic region in the 1970s. Nevertheless, media independence, we have argued, does have relevance in current media policy debates.

As Bennett (2015) holds, as long as media independence serves as a positive vision or "utopian ideal" for journalists, activists, policy-makers or media organisations, then it clearly matters. Besides motivating people, the debate over the meaning of independence, and the various forces that it needs to be guarded from, is in itself often useful for clarifying the position of different types of media formations in society. But from the perspective of media policy and critical research, it is essential to acknowledge that the meaning of the concept cannot be fixed into any universal definition. Understanding media independence as a relational concept allows it to serve a role in debates about the position of different media in relation to other social forces, but it hardly provides a neutral yardstick that could be used to measure all types of media with common normative criteria.

What we talk about when we talk about media independence, then, are the characteristics of the relations between, on the one side, specific entities ranging from media institutions, via journalistic cultures, to individual speakers, and, on the other, their social environment, including the state, political interest groups, the market or the mainstream culture. Media independence is not one definite thing, and acknowledging that would often lead to a more fruitful media policy debate.

CHAPTER 5

The Unbearable Lightness of Being Alternative: Idealism-Realism and Purism-Pragmatism in Greek Alternative Media

Dimitra L. Milioni and Pantelis Vatikiotis

Journal of Alternative & Community Media 5, no. 1 (2020): 103–22. https://doi.org/10.1386/joacm_00077_1.

Abstract

The article explores alternative media sustainability across a wide range of Greek projects. In this regard, it probes into a number of factors related to both the political economy (funding, organization) of these projects and the nature (real/'imaginary', broad reach/niche) of the relationship with their communities/ audiences. The findings of the research reveal a dynamic and contradictory field regarding alternative media resilience in terms of the dialectical relationship of idealistic/realistic (on the production, organization level) and puristic/pragmatic (on the communication, reach level) features. The article concludes by highlighting the strategies employed by the most successful projects in terms of sustainability in relation to their positioning along the idealism/realism and purism/pragmatism nexus.

Keywords

sustainability, alternative media, Greece, funding, organization, community formation, outreach

Introduction

In her well-known swamp metaphor, Rodríguez deconstructed the view that the often contingent, ephemerous, 'fragmented and improvised nature' (2001: 22) of alternative media is a reason to dismiss their political potential and disregard them as powerful agents of change. As she writes, alternative (or citizens') media's short life cycles leave 'what at first glance seems to be—no signature, no accomplishments, no successes. […] Instead, what we find is a multitude of small forces that surface and burst like bubbles in a swamp' (2001: 22). Rodríguez is of course right in pointing out the situatedness and historicity of subversive political action. At the same time, however, as much as 'these bubbles are a clear sign that the swamp is alive' (2001: 22), the vulnerability of alternative media is a crude reality, one that has consequences that surpass the life cycles of specific projects and the life experiences of their participants. Sandoval and Fuchs (2010) point out a particular danger they associate with participatory media but can be extended to alternative media in general, namely, the marginality that prevents them from gaining public visibility and establishing a broad counter-public sphere (the 'alternative ghetto' risk).

The literature on alternative media spares no effort in producing different definitions of the projects' social reality (radical, community, participatory, citizens', alternative, social movement, tactical, critical, rhizomatic media, to name some). Objections raised point either to the vagueness, emptiness, or the particularistic frames and connotations of these terms (Downing 2010). Acknowledging that none of these terms can provide a once-and-for-all term of a very heterogeneous, fluid and contested field, this article employs the term 'alternative' to acknowledge this elusiveness rather than as a definition 'to which [social] realities are then required to conform' (Gumucio Dagron 2004: 54).

Questions of sustainability touch upon two factors that have rarely been discussed in tandem: funding and structural organization, and community formation and outreach. The present study attempts to provide a dialectical understanding of these axes vis-à-vis alternative media resilience, exploring how a large number of diverse alternative media projects in Greece position themselves in terms of their political economy (idealism vs. realism) and their relationship with communities and audiences (purism vs. pragmatism). Besides theorizing the dialectical relationship of these axes, best practices and strategies are identified and discussed with a view of tackling the many challenges of the alternative media sector.

Alternative and Community Media

The renewed focus on alternative media has been sustained by approaches that work through syntheses of different areas and positions, evaluating the multiplicity and transformative nature of the research subject. Prevalent is here the employment of the 'alternative and community media' framework. For instance, a recent and vast companion to the subject, Chris Atton's (2015b) edited collective volume, evaluates alternative and community media as analytical categories to work with, reflecting on diverse applications across various contexts. The terms 'alternative' and 'community' reflect on two main reference points of the research subject: its tension with mainstream media (alternative) and the setting it takes place (community).

Several approaches put emphasis on the production/organization and the content/form of alternative media. A number of issues highlighted in the respective literature include alternative news and counter-information (Traber 1985; Herman and Chomsky [1994] 2002), alternative production/distribution (Duncombe 1997; Atton 2002), resistance/prefigurative politics (Downing 2001), activism (Lievrouw 2011) and critical content (Sandoval and Fuchs 2010). Other approaches focus more on the communication/usage and the context of participatory/community media. Here, prominent issues of consideration are community-building/development (Servaes 1999), public communication (Jankowski and Prehn 2002; Rennie 2006), civic engagement (Dahlgren 1995) and the enactment of citizenship (Rodríguez 2001).

Presenting alternative and community media as analytical categories allows us to capture the dynamics developed across such diverse domains (production/distribution, form/content, agents/users, engagement/reception, objective/purpose) of their realization. Studies avoiding a 'prescriptive definition' (Lewis 1993) and a 'reductionist understanding' (Atton 2015a) of the field have drawn on these categories (interchangeably, or jointly used). Lewis' (1993) study on alternative/community's media impact (an UNESCO project on different media projects and contexts) has elaborately sketched a number of modalities (motive, funding, organizational structure, message content, relationship with audience, composition of the audience etc.) upon which 'alternativeness' is constructed (experienced or expressed). In the scope of a broader study on alternative and community media, Atton highlights also multiple dimensions of their implementation, from the political economy of media production (organizational practices, critical content) to community formation and engagement, considering also a number of challenges addressed as 'practices develop and the context around them develops' (2015a: 3). [1]

And Sustainability

Questions of sustainability have a practical relevance to both political economy and relationship with the community/audience. As Coyer et al. (2007) put it,

> sustainability is not just about financial security but it is also about how your project is set up and organised, how it is distributed and who the audience is—and what other means of social support and community participation might be a part of it.

Research on the production and organization of alternative media has pointed out that a very controversial issue for alternative media is whether or not to employ mainstream economic and organizational mechanisms, techniques and skills. In Atton and Hamilton's (2008) words, 'the general political-economic dilemma for any critical project is that it needs resources with which to work, but those crucial resources are present only in the very society that it seeks to change or dissolve' (2008: 26). According to the Comedia (1984) report on the underdevelopment of alternative press, the marginality of the sector ('alternative ghetto') stems from its internal weaknesses:

> the absence of a clear conception of target audiences and of marketing strategies to reach new audiences; the failure to develop necessary skills in the areas of administration and financial plan-

[1] The hybridization of alternative media (see Carpentier et al. 2003) and the ambivalent role of the corporate social web (see Fuchs 2014) figure prominently in this regard. (2007: 261)

> ning; and the commitment to an inflexible model of collectivity as the solution to all organizational problems. (1984: 95)

On the other hand, Khiabany (2000) critically reflects on Comedia's proposal for alternative media to employ mainstream economic and organizational techniques, drawing on the failure of a British leftish publication (*Red Pepper*) that followed Comedia's business strategy; by contrast, leftish publications that followed the more orthodox, Leninist-socialist model (closely tied to working-class or socialist parties), 'have survived longer and have attracted more readers that did the attempt to construct a broader and more commercially sophisticated alternative' (2000: 462).[2] The discussion on the sustainability of alternative media provides a prolific context for further research. These crisp reflections on the financial and organizational levels of alternative media ask for considering and comparing different strategies employed in the political economy spectrum (from idealistic to realistic ones): reject or accept advertising and any kind of funding related to capitalism; collective or more institutionalized organization; volunteer engagement or paid labour models; and de-professionalization or distinct professional roles.

Regarding communication and usage of alternative media, the discussion on sustainability has been addressed in terms of the democratization of communication, satisfying the communication needs of certain groups, from diverse perspectives. In the development paradigms, the issue at stake is the redistribution of communication power, in terms of facilitating access and participation of excluded, marginalized communities in the communication system (see Berrigan 1979), eminently addressed in the MacBride proposal (MacBride and International Commission for the Study of Communication Problems 1980) to consider another human right entitlement, the 'right to communication'. In the western context, community communication is conceptualized in terms of small-scale forms of public communication, promoting communicative exchange and social action (Hollander and Stappers 1992). Both above-sketched frameworks of democratization of communication have fuelled further reflections on the field, acknowledging subtle complexities and dimensions in regard to cultural and social identities as well as to subordinate and specialist groups' interests. Accordingly, different accounts evaluate diverse aspects of reflexive engagement in/with community media, on the grounds of enhancing participatory communication, or the very realm of public sphere(s). In any case, 'processes of empowerment, conscientization and fragmentation of power' (Rodríguez 2003: 190) run through the dispersed nature of engagement in/with citizens' media. That said, the issue at stake is how such an engagement is constructed. Elaborating into the communicative procedures (of production), Huesca points out the 'two-sidedness' of alternative communication: 'participatory media involve marginalizing, as well as empowering, giving voice, as well as taking voice away' (1995: 115). Broadly, this contradiction reflects on the nature of the relationship of alternative media with their communities/audiences/users, in terms of either creating/preserving a niche (purism) or reaching out to broader audiences (pragmatism).

---

[2] Still, further questions are raised when considering alternative media that 'pursue radical criticism at the level of content but are not necessarily alternative at the level of economic product form and production processes' (Sandoval and Fuchs 2010: 148). For Sandoval and Fuchs, projects that employ commercial financing, though, while remaining critical content-wise (*Adbusters, Mother Jones, Le Monde Diplomatique*) are representative of alternative media that overcome marginality and reach broader publics.

Research Focus

Few studies have dialectically probed into diverse domains of alternative media, and they do so by focusing on a single-case study. Bailey et al. (2008) contextualize their multi-dimensional approach on alternative media highlighting diverse positions, identities (serving community, alternative to mainstream, linking to civil society, rhizomatic links) articulated in the Brazilian movie *Radio Favela.* Kejanıoğlu et al. (2012), drawing on the Independent Communication Network (BIA) in Turkey, examine participation at both production and reception ends, [3] paying attention at a rather neglected dimension of the alternative media studies, the audience/user (Downing 2003).

The present study, having an interest in alternative media sustainability, probes into a number of factors related to both the political economy of these projects and the nature of the relationship with their communities/audiences. It does so by considering and comparing diverse alternative media projects implemented in a specific social, political, cultural and technological context (Greece), 'tak[ing] account of the situatedness of these media' (Atton 2015a: 9). Specifically, the research evaluates alternative media producers' positions on the production/organization and the communication/reach of their projects, pointing out challenges and tensions in running and maintaining alternative media projects. The sample of the study reflects on diverse inputs (social movements, communities and civic actors) in the production of alternative media projects. Also, the research interest in the communication/reach of these projects cannot but come across the audience side too. As Downing (2003) points out, 'alternative-media activists represent in a sense the most active segment of the so-called "active-audience"' (2003: 625–26). One would imagine that they above all would be passionately concerned with how their own media products were being received and used'.

Against this background, the study explores alternative media sustainability across a wide range of Greek projects [4] (see Appendix for a brief description), reflecting on two research questions:

1. To what extent are the various projects characterized by idealism or realism in terms of their political economy?
2. What approaches and practices (purism vs. pragmatism) do they employ to consolidate or extend relationships with their communities/audiences?

[3] Carpentier (2011, original emphasis) has eloquently sketched these two interrelated spheres by making an analytical distinction between 'participation *in* the media' (participation in production and decision-making) and 'participation *through* the media' (participation in the public debate and self-representation in various public spaces).

[4] Alternative media have a long tradition in Greece, but since the 2008 and 2011 uprisings, there is a growing interest in the literature about these practices. However, most approaches adopt an activism perspective (see Milioni 2009; Vatikiotis 2011; Siapera and Theodosiadis 2017).

Fieldwork

To answer these questions, we carried out interviews with media producers in fifteen alternative media projects.[5] To sample them, we first created a comprehensive map of alternative media projects from various sources (lists aggregating alternative media in Greece, searches in search engines, lists of projects provided by the most well-known alternative media). Sixty alternative media were originally selected and separated into different categories, according to their aim, core identity (e.g., topical focus, political affiliation), frequency of activity and media type (e.g., print, online, radio, TV). According to this categorization and aiming at creating a sample that would reflect the diversity of these projects, a list of 31 projects was compiled. Up to three invitations by e-mail were sent out, followed by telephone calls (where available). Participants from fifteen media projects replied positively and face-to-face or teleconference in-depth, semi-structured interviews were conducted by the authors (individually or in groups of two). The interviews lasted on average one hour and 45 minutes, ranging from 43 minutes to 2.5 hours. Being part of a larger project, the interview guide included 40 open-ended questions focusing on wide range of topics (e.g., the producers' life trajectories, the projects' characteristics, aims and claims, structure and funding, principles and values, ideological positions, perceived effects and self-criticism). In the current analysis, we draw on materials addressing our research questions. The analysis was complemented with information and documents available in the projects' websites (e.g., mission statements, project description and aims).

Analysis

The analysis of the case studies in relation to their (1) funding and organization and (2) the relationship with their community is deployed across two axes accordingly (Figure 1): (1) idealism (rejection of advertising and any kind of external funding, collective organization, volunteer engagement, de-professionalization)—realism (acceptance of advertising and other sources of funding despite dependencies, more institutionalized organization, rejection of voluntarism, distinct professional roles); (2) purism (creating/preserving a niche and establishing an 'imaginary' relationship with audiences)—pragmatism (reaching out to broader audiences and engaging in interaction with them).

Funding and Organization: Idealism vs. Realism

Idealism

In the idealism-realism axis (see Figure 1), several alternative media projects occupy the one end, exhibiting all features of the 'idealist' condition in terms of their political economy:

[5] The media projects are described in the Appendix. One project is not named—indicated as '*M*' in the analysis—to safeguard the producers' anonymity (as it was produced by only two people). Thirteen interviews were held with eighteen interviewees: five interviews were held with two participants in the same projects, whereas one interviewee was involved in (and covered in their interview) more than one project. Five interviewees were female and thirteen were male. All interviewees cited have been assigned fake names.

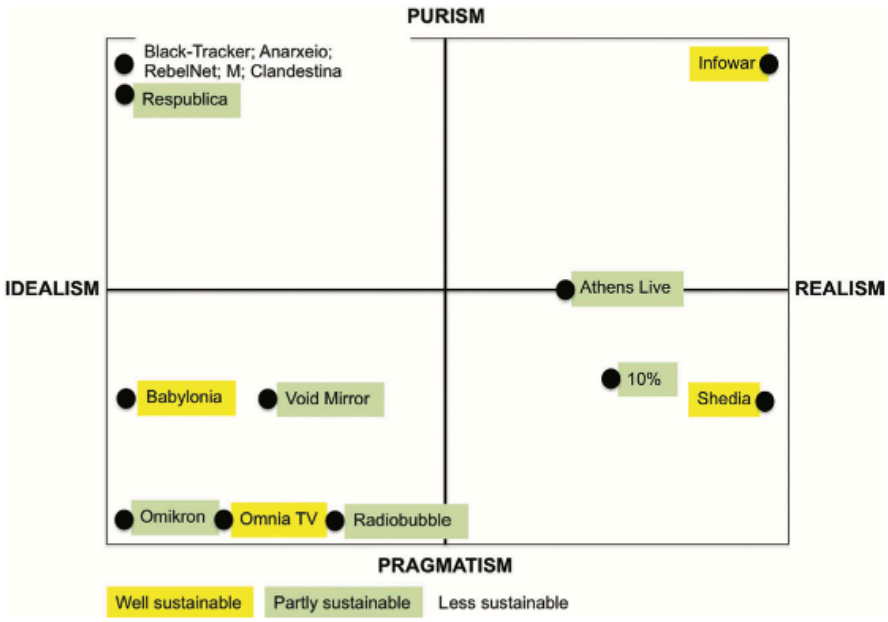

Figure 1: Mapping of alternative media projects in two axes: idealism-realism and purism-pragmatism.

Black-Tracker, Anarxeio, RebelNet, Clandestina, ResPublica, M, Babylonia and Omikron. All these projects are self-funded, mainly through unpaid work by the producers.

> I have supported financially all expenses—and indeed amid unemployment. Because with one and a half months of work per year, you cannot cover the costs of a website.
>
> (Markos, *M)*

As they are all online-only projects (with the exception of *Babylonia* that publishes a print issue of the magazine annually) with low-operating costs, the producers either cover these costs themselves or fund them through events, such as parties and festivals, some donations, and, in the case of *Babylonia*, the sales of the annual issue of the magazine. The decision to create a web-native project was in most cases dictated by cost-related reasons. *Babylonia,* for instance, started as a print newspaper in 2003, shifted to print magazine in 2011 and became an online-only magazine in 2015.

With the exception of *Babylonia,* which is one of the most long-lived projects studied and has a firm presence, the rest of the projects are, more or less, in a state of precariousness. Despite this, they outright reject advertising and any other kind of external funding, such as sponsorships and grants, for ethical reasons as well as to preserve their trustworthiness:

> No, out of the question. This would be a disgrace.
>
> (Pinelopi, *Clandestina)*
>
> No, no, no, this is against all principles! […] Otherwise, our credibility is gone. […] Nothing, nothing, nothing! There is no company behind it, there is no scheme. It's just a group of volunteers who do this.
>
> (Christina, *Omikron*)

Even practices such as crowdfunding are out of the question, in principle (because they have been 'appropriated by capitalism') but also out of frustration for the lack of support by audiences in Greece:

> Interviewer: Have you considered crowd-funding as a model?
>
> Of course not, because there is also an ideological issue […] We are trying to avoid using capitalism's tools […] Where is crowdfunding based? On solidarity. On free financial contribution […] A very good tool for capitalism, that's what it is [nowadays].
>
> (Markos, *M)*
>
> generally, people go to concerts but do not spend money […] It's the existing mentality. They don't support any endeavors […] raising money to support a counter-information project is the worst part […] Not doable.
>
> (Markos, *M*)

Omnia TV also falls under the idealism category in terms of its political economy, sustained by voluntary work, contributions by people close to the producers, donations through the website and, occasionally, by selling products such as T-shirts. Having tried advertising through AdSense (in their view, the only form of advertising that does not create direct dependencies), they soon abandoned it, because of low turnout and high management cost. In general, they outright reject direct advertising because of the dependencies it incurs:

> Whatever principals or rules we establish about what kind of advertising we accept, we would still be operating as a company, more or less. For instance, if a small shop or enterprise places an ad and tomorrow, we realise that there is a complaint by employees for labor exploitation, what will we do? Take the ad down? Return the money? Play dumb? Not publish the complaint? These are the problems that stem from capitalism and we don't want any of that
>
> (Andreas, *Omnia TV)*

Omnia TV's producers have many qualms about the use of corporate social media (Facebook, Twitter) and are very conscious about the inequalities they create. Although they use them heavily, they are aware of their disempowering effect on collective alternative media projects:

> What probably plays a role in the weakening of grassroots information projects is that many users now act directly, individually. I don't know if this is good or bad but social media encourage direct uploading by any user. They build a brand, e.g. user x is a well-known user who takes pictures and informs about what happens in Athens etc. This functions in a dissipating way regarding the past tendency for more collective media.
>
> (Andreas, *Omnia TV)*

Other projects combine idealistic with realistic positions. *Void Mirror* is based on a principle of 'zero economics', meaning no investment in neither profit from the project. While all activities are self-funded (external funding is precluded), more popular activities (e.g., festivals) help fund smaller and more artistic projects. The 'zero economics' strategy reflects an idealistic 'counter-corporatization' ethos within the collective that has helped participants establish'authentic relations', without'allowing capital to come between them' (Damianos, *Void Mirror).* In more realistic terms, *Void Network*, the collectivity that runs *Void Mirror*, assists artists and intellectuals publicize and sustain their art/work by 'dipping into the

mainstream by any means they prefer', beyond the project. *Radiobubble* has also combined various means and models of financing. It started as a self-financed web radio project (later included a citizen journalism project, #rbnews) by two participants, who got a loan to initiate the project. Attempts to attain sustainability included offering courses (the 'hackacademy'), crowdfunding, drinks from a café-bar that was the physical place of the project for a period of time, donations by participants in the project, and advertising local, neighbouring businesses and organizations. Financially unstable but successful in terms of citizen participation, the project underwent a crisis when the prospect of making profit, as well as accepting state sponsorship, created a cleavage in the core team. At the moment, the project works as a social cooperative enterprise and is hosted by a theatre in Athens, compensating for its rent and bill expenses by advertising the theatre.

In terms of internal organization and structures, these projects also resemble the alternative media archetype (see Atton 2002). The preferred model of internal organization is characterized more or less by structurelessness, which takes the form of absence of distinct roles and tasks for participants and firm time frames. Partly due to the small size of the project teams and the friendly relations among the members, a formal organization becomes unnecessary.

> Relationships are made of friendship, camaraderie and politics all at once and this is, let's say, the big strength of any collectivity.
>
> (Pinelopi, *Clandestina)*

Organization is generally collective and de-professionalized, with rotation in allocation of responsibilities, based on the values of solidarity, respect, trust and accountability. The form and intensity of participation is usually decided by the participants themselves, consciously avoiding formal designation of roles:

> everyone knows a bit of everything […] there is a common experience that's shared, because everybody goes through every position.
>
> (Damianos, *Void Mirror)*
>
> Each one puts in whatever time they have. It's just that John [fake name] and I and some of the other guys do a little bit more because we are more attached to it […] It's a collective effort because each one does what they can. Now it so happens that for the meetings us two are more flexible […] For some of the other guys who have jobs, it's a bit harder.
>
> (Christina, *Omikron*)
>
> there is solidarity amongst us, meaning that when someone has undertaken something, there is no way someone won't go to help out.
>
> (Zoi, *Babylonia*)

Omnia TV, despite following the same lines, is the only project in the idealist category that is not afraid of (a degree of) institutionalization. For instance, its producers consider the possibility of creating a cooperative company to implement productions (e.g., documentaries) that could help sustain the main project (*Omnia TV)*. Also, they are open to a partial professionalization of citizen journalism in exchange for being granted some privileges now restricted to professional journalists (e.g., accreditation and subsequently access to official sources).

Realism

At the other end of the idealism-realism spectrum, we find four projects: *10%, Athens Live, Infowar* and *Shedia*—the latter two being the 'purest' types of realist projects. In terms of funding, *Shedia* is the most successful project of our sample. With a business model that combines commercial advertising, subscriptions, fundraising events and donations/sponsorships from the private sector (~50 per cent of the magazine's expenses combined), as well as revenue from sales (the remaining 50 per cent), *Shedia* has achieved financial stability during the past five years. As recounted by one of its producers, the people who had envisioned the project spent six years looking for a start-up funding. Utterly disillusioned by the rejections due to the nepotism of the Greek political system, they applied for a grant to Stavros Niarchos Foundation [6] and submitted an elaborate and well-thought business plan. After scrutinizing the plan, the foundation granted them €80,000 as start-up funding.

10%, a magazine focusing on gay issues and fighting homophobia, attempted to follow a similar path combining advertising, sponsorships and volunteer work, but abandoned this model after two years finding itself in debt due to advertisements that were never paid. Frustrated by the failure of the advertising model and rejecting online ads due to poor revenue and low quality (explicit sexual content), the magazine has now ceased looking for advertisers. Yet, they are still in favour of mainstream advertising despite the possible dangers (e.g., 'pinkwashing'); achieving financial independence to achieve their end objective is preferred over maintaining a pure ideological stance:

> To achieve my goal, I can use whatever means I deem appropriate. Mainstream advertising is one such means. […] It's one thing to have a leftist opinion, I respect it but […] I believe it's wrong because it doesn't help me fight homophobia and repression […] It is possible, of course, that a coca-cola ad will facilitate pinkwashing. I will take this into account, I will take measures not to allow it.
>
> (Pavlos, *10%*)

Similarly, *Shedia*'s producers have few concerns about advertising (state or commercial). Based on their experience so far, they do not believe that advertising interferes with their social mission or their journalistic writing. Therefore, with the exception of extreme cases, they are not selective towards advertisers.

In short, *Shedia* operates in ways similar to a healthy corporate media organization, and its producers do not regard this funding model as antithetical to their function as an alternative, socially oriented media project. *Infowar*, an independent, critical but largely professional news project, is funded by selling its radio documentary to affiliated radio stations, publishing articles in other outlets, by online donations and commercial advertising through AdSense. Online ads were chosen because of the project's inability to attract advertisement through traditional channels: although the journalist attempted to get a share in the advertising market, his project was 'blacklisted' by advertising agencies, due to his radical journalistic stance. *Athens Live*, a project started in 2015 to create an alternative model for independent professional media, employed crowdfunded, earning €25,000 from the campaign, and set up a non-profit organization. Accepting neither advertising nor sponsorships and depending

[6] A charitable foundation supporting various non-profit organizations created by a multi-billionaire shipping tycoon.

mainly on volunteering journalists *(who work as freelancers for other media)*, it is funded so far by international projects *(funded by Google and the European Union)* and similar funding schemes.

In terms of internal organization, *Shedia* is a rather centralized organization with a core team of seven paid professionals. The content of the magazine is produced by volunteering journalists, some of which (those in the most precarious state) get paid occasionally. The people who make up the core team have distinct professional roles, according to a clear hierarchical structure. In general, *Shedia*'s producers view the magazine through the lens of 'professionalism', striving to make a 'product' as good as possible to satisfy the audience—alongside the social goal of supporting the homeless. Likewise, the producer of *Infowar* carries the mentality of the media professional. Being the sole producer of his project (apart from a paid collaborator responsible for the technical support), he objects to volunteers' engagement—in principle (considering it exploitation) and for practical reasons. *10%* and *Athens Live* also embrace professionalism. *10%* has a rather centralized organization with a small core editorial team. There is some hierarchy (there is a director), but other roles are more flexible. *Athens Live* experimented with horizontal organization practices but abandoned them in favour of a model of clear division of tasks and roles.

Relationship with Communities and Audiences: Puris\m vs. Pragmatism

Purism

Several of the projects analysed in this study occupy the 'purist' end in respect to their relationship with communities and audiences of their projects. Purism consists, on the one hand, in maintaining a rather enclaved community and not reaching beyond a niche audience—what Sandoval and Fuchs call 'individualistic spaces of withdrawal'(2010: 143)—and on the other hand, in adopting a fairly monological model of communication and forming an imaginary relationship with audiences.

The projects adhering to anarchist politics (*Black-Tracker/Anarxeio/RebelNet, M*) are rather closed circuits. They exclusively address the anarchist public sphere, and the projects are not actively communicated in the broader alternative media realm. Despite some concerns about how the broader anarchist movement can reach to 'the people', *M*'s producer considers the project's readers as a niche audience *(in ideological terms)*, which is not expected to increase or decrease considerably:

> We have to think in today's terms and conditions, how we'll be able to fight based on our ideology and how we'll approach the people […] [*M*]'s audience is pretty standard. You don't expect it to grow nor shrink. This is a significant matter.
>
> (Markos, *M)*

The producer of *Infowar* acknowledges that his radical/polemical analysis of news 'preaches to the converted':

> This is always the problem of all these efforts, what in English is called 'preaching to the converted'; with Debtocracy [documentary] only a few times I feel we succeeded in opening up to a world we had no relation with […] more or less these projects get stigmatized and […] people who are politi-

> cally and ideologically across from you […] you don't win them over easily, […] very slowly you may expand your reach.
>
> (Leonidas, *Infowar)*

Similarly, the producers of *Clandestina,* when asked about the project's weaknesses, acknowledge the need to further bring together dissimilar groups to form a common front:

> we didn't manage to create many self-organized cells with immigrants and Greeks, all together, all over Greece.
>
> (Pinelopi, *Clandestina)*

The producers of these purist alternative media imagine their audiences in terms of homophily, namely, as broadly like-minded people, open to critical analysis of ideas but within a certain ideological sphere. Envisaged as channels to communicate and strengthen a particular 'voice' or achieve certain goals, they do not typically encourage discussion, at least not in the online spaces their projects operate. For instance, in *M,* dialogue with readers is generally rare, whereas in the immigration-focused project *Clandestina*, the producers have an imaginary relation with their audience—solidarity citizens/ groups, individuals working in non-governmental organizations (NGOs) and media professionals on the basis of providing information for immigrants and refugees. Similarly, the producer of *Infowar* engages rarely in actual interaction and discussion with the audience: social media are used mostly for the promotion of his articles and radio documentaries. From a different perspective, the producer of *ResPublica* imagines his audience in terms of 'people who are doing PhD' (Iraklis, *ResPublica).* Moreover, he has reservations about the role of the Internet and social media in communicating a discourse, as they are considered 'suitable for dissemination/promotion, not for discussion'.

Pragmatism

Pragmatism is used here as 'reaching out' to a broader community and involving processes of interaction and discussion so that a 'real' relationship with audiences is formed.

Pragmatism is adopted by several alternative media projects. *Omikron,* for instance, embraces a strategy of open participation in the project by welcoming anyone who is willing to contribute in the group's physical meetings. In terms of reach, *Omikron* producers adopt a tactical approach: they attempt to get their message across mainstream media by, first, creating content that the latter cannot ignore and, second, by working with journalists to show them different viewpoints about political and social issues in Greece, using the language of 'facts' instead of advocating 'opinions':

> We give the data and tell a story with them […] You don't see an opinion anywhere. You don't see an editorial line being forced […] our goal is to make them think twice about what they'll say. Not just the journalists but whoever consumes these media. We are successful in that. […] It's just facts, nothing more. […] You just show two sides of the same coin.
>
> (Christina, *Omikron)*

Omnia TV is the only project in our sample that adopts the open publishing model: anyone can publish an article or create a TV show, without pre-moderation; any objections are discussed

openly in the comments section in each post. *Omnia TV* not only pays particular attention to web analytics to understand the audience but also establishes a real relationship with readers, utilizing the feedback mechanisms of social media. At the same time, it assumes an inclusive approach and invites diverse (political) voices, aspiring to reach beyond the anarchist milieu and not be restricted to 'counter-information':

> we want to reach as many people as possible, beyond specific political camps […]. We always had in the back of our minds another way to make [the project] a bit broader accepted. Meaning you don't have to tell someone 'I am anti-…' beforehand. Not to hide your position but there is no reason to say, 'do you accept me? I'm anti-…' Present information in the right way with the right methodology, without lies, without misinformation, without spin, distortion or isolated truths to support a point of view, and one will decide whether your position makes sense or not.
>
> (Andreas, *Omnia TV*)

Radiobubble has been a very successful case of citizen-led media, in journalism (the creation of the data journalism project rbdata.gr, collaborating to The Migrant Files project that won European Press Prize), and beyond it. It succeeded in forming diverse communities of interest (around music and news), virtually and physically, extending its reach to conventional as well as radical voices across a wide spectrum of perspectives. Like *Omnia TV*, it established a real relationship with its audiences and users through regular interaction in physical and digital spaces alike—what they themselves called 'phygital'. However, this vibrant community subsided over time and the citizen journalism part of the project died away, leaving a smaller group of amateur producers focused on music. *Radiobubble* interviewees reflect on the extreme difficulty to manage in practice, without sufficient resources, such a plethoric and open project—from training everyone in technical issues to maintaining a diversity of perspectives within it. Interviewees express their feelings of 'failure' in this respect:

> We were failing miserably […] to manage the ideas that kept emerging from our people. Because all of this was happening by putting in personal work hours without pay […] whereas it could thrive if there was financial autonomy […] In my opinion we failed to manage all this panspermia because it outgrew us.
>
> (Ermis, *Radiobubble)*

The pragmatic ethos is less explicit, but still noticeable, in *Babylonia, Void Mirror, Shedia* and *Athens Live. Babylonia* has attempted to extend its reach beyond anarchist publics. It organizes the annual, international, anti-authoritarian festival B-Fest and engages in many ad hoc initiatives and collaborations with other alternative media, social centres and journalists from mainstream left-leaning media. The online magazine 'hosts' different voices, sometimes even liberal positions, and facilitates interaction with its users through various channels (e-mail, social media and the circulation of a weekly newsletter). At the same time, however, this outreach is generally situated within the broader institutional framework of anti-authoritarian politics, excluding perspectives that may challenge this framework:

> There are red lines of course […] Anything that contains the notion of power doesn't have a place in [the project].
>
> (Athina, *Babylonia)*

Void Mirror perceives its audience as a community of already active, critical-thinking people, as 'comrades':

> We don't differentiate between ourselves and the audience, in fact, we are addressing comrades, people who are already active […] with critical thinking […] and we are trying to create the conditions where the audience becomes a participant in the production.
>
> (Damianos, *Void Mirror)*

It establishes a 'real' relationship with audiences based on the creation of 'actually lived realities' (events or situations). This emanates from their 'counter-theoretical' philosophy, namely, the conviction that the production discourse should be experiential (lived experiences) rather than textual (articles and speeches). The *Void Mirror* interviewee also stressed the diversity of perspectives and backgrounds of participants in the project and reflected on the project's main aspiration, that is, to bring various subcultures in contact with each other and allow them to blend. The collectivity has initiated various projects with other groups, some of them from different political milieus. However, this diversity occurs within a rather well-defined ideological framework, the 'libertarian culture'. *Shedia* is a street paper and its journalistic content touches upon various topics, news of general interest as well as entertainment, for example, sports, targeted at broad audiences. Although the producers do not have in place mechanisms of regular interaction with readers, they employ market tools such as audience surveys to understand the audience and strive to satisfy their informational needs by delivering a 'product' (the magazine) of high quality by professional standards. *Athens Live* has chosen to report news about Greece only in English, with a clear orientation towards international audiences. Its goal is to highlight and communicative alternative perspectives about political events in Greece and reach broader audiences, overcoming what they consider a short-sighted perspective prevalent in Greece about 'alternativeness':

> We don't want to stay an alternative project. We want to have a truly credible voice and a profile that will bring us a wider audience, that will break free from […] that mentality of the alternative.
>
> (Alekos, *Athens Live)*

Lastly, the gay magazine *10%* exhibits some elements of purism, such as providing limited interaction with readers of the magazine and addressing a particular community (gay men). On the other hand, the producers have seized every opportunity to contribute to mainstream venues in order to get the message across and not preach to the converted (Pavlos, *10%*), even if they have been criticized by purists:

> Because of *10%,* I was asked to write articles for other magazines. Time Out Athens discovered me from *10%* and asked me to do a gay column […] I did it to diffuse the message to the broad public […] To my expense, since I had to write about nightlife and I didn't know anything about that […] When I published this article in Protagon, I was accused of being a sell-out […] [Regardless, I did it] to diffuse the message where I do not have access.
>
> (Pavlos, *10%*)

Despite the absence of mechanisms for regular interaction with readers in the online magazine itself, the producers of *10%* engage in other activities that they regard as synergistic to the media project, such as excursions, dance lessons and board games, aiming at creating shared

realities for gay people. In their view, these activities attract significant numbers of people due to the 'brand name' the magazine has created, in respect to its quality and trustworthiness, which, in turn, has earned the gay community's trust. Participation in these events is, therefore, the means by which the project creates a sustaining relationship with communities and which, in turn, creates a solid basis for further developing the project.

> We have gotten much feedback about all that *10%* has to offer not only as a publication but as a brand name, because our dances are the *10%* dances, our yoga is the *10%* yoga […] So this brand name, with the trustworthiness that has now, provides a safe setting, one knows that he will go there and […] will be safe.
>
> (Pavlos, *10%*)

Discussion: Strategies and Practices to Achieve Sustainability

The sustainability of alternative media projects is assessed in terms of their financial viability and their longevity. In this section, we discuss how the positioning of the various alternative media discussed, in terms of their political economy and their relationship with their audiences and communities, is related to their (prospects of) sustainability. The most successful projects in this respect are found at the bottom and the top right in the respective mapping according to their idealistic-realistic and puristic-pragmatic features (see Figure 1).

Realism-pragmatism

Clearly, the most accomplished project in terms of financial stability is the street paper *Shedia,* selling up to 30,000 copies monthly and attracting significant funds from the market. *Shedia* combines a realistic approach in its political economy with a pragmatic approach in terms of its relation to its audience. More particularly, *Shedia*'s success seems to be a result of crafting a well-thought business model, adopting mainstream tools and strategies such as commercial advertising, sponsorships from the private sector, and professional tools for audience analysis to produce a 'marketable' product. The success of this model allowed them to overcome the volunteering model and sustain a team of paid 'employees', embedded in a hierarchical organizational structure. Key to this success is their decision to reach beyond partial publics, by producing journalistic content with a broader appeal, by professional standards. *Shedia* has succeeded thus far in maintaining a balance between editorial independence and its embeddedness in the market: its producers do not feel that these strategies mess with the social mission of the project or threaten their independence in terms of editorial practices. However, *Shedia* is not engaged in radical political criticism or counter-information reporting practices that can be seen as openly challenging the status quo.

Other projects that combine realistic and pragmatic approaches have less apparent prospects of viability, such as *10%* and *Athens Live*, mainly because neither of them has settled in clear business strategies, although they have been experimenting with many models *(e.g., social, cooperative enterprise, non-profit organization)*. A positive strategy that stands out, despite not *(yet)* translated into a clear model for revenue, is *10%*'s practice of creating a 'real', rather than imaginary, relation to its audience by engaging affiliated communities through events that create shared realities. Here, sustainability emerges mainly out of the trust with which

the magazine is endowed by audiences and is then extended to synergistic activities, which, in turn, deepen this relationship. *Athens Live*, on the other hand, in its quest of novel ways to achieve financial independence, is at the crossroads of a strategic decision—to run as a non-profit organization or as a start-up company *(calling for investors)*. Still, some rather dubious strategies of organizing the project echo practices quite common in neo-liberal markets. For instance, the motivation of journalists volunteering in the project is based on the expectation of building a personal reputation and being 'discovered' by professional media as freelancers for paid assignments. At the same time, participants are expected to 'get rid of the ideology of the freelancer' *(Alekos, Athens Live)* to advance the 'collective good' of the project (which means that the project is credited for news pieces produced instead of individual media workers).

Realism-purism

Infowar, the only project in this sample that combines realism with purism, has also proven viable so far. Basically a 'one-man project', it has managed to build a reputation and sustain itself, as part of a broader network of the journalist's productions, including critical documentaries produced through crowdfunding and articles published in other outlets. Uncompromised in its radical stance of reporting and news analysis, it restricts itself to a specific audience, to which is related in a rather monological manner. Yet, the key factor to this project's viability seems to be professionalism and the subsequent high quality of reporting and documentaries, which has gained the audience's trust, although this is not yet translated into direct revenue. In this sense, purism (addressing a niche audience) is not necessarily antithetical to sustainability, as long as there are some mechanisms of capitalizing audience loyalty.

Purism-idealism

When mixed with idealism, however, purism does not seem to create favourable conditions for sustainability. The purist-idealist projects under study are in a precarious situation as they depend entirely on the participants' continued availability in terms of time and resources. The producers themselves recognize this weakness as they report difficulties in keeping the project updated in a consistent basis, while being active in the off-line world (*Clandestina, ResPublica*), and under-functioning of these initiatives as they realize that they have not reached their full potential (*Black-Tracker, Anarxeio, RebelNet*). Some of them (e.g., *M*) are not particularly optimistic about the future in this respect. Therefore, maintaining an idealistic position, namely, excluding any form of external funding and depending on volunteer engagement of a rather closed circle of participants, while preserving a puristic approach on communication, by refraining from extending their outreach to broader audiences and engaging in interaction with existing audiences, renders the endurance of these projects challenging.

Idealism-pragmatism

The idealist-pragmatist projects analysed show rather good prospects of sustainability, especially *Babylonia* and *Omnia TV*. The former is a project that has survived for a long time (fifteen years, in different formats) and shows no signs of decline. Despite depending on voluntary work, its broad network of collaborations, and the organization of successful events such as B-fest, provides the project with sufficient resources to go on. *Omnia TV* producers'

commitment and enthusiasm, as well as its solid organization (secure space, equipped studio), also create positive prospects. In addition, *Omnia TV* is open to partial institutionalization and conditional professionalization as a potential strategy to develop the project further, without compromising its critical character. Structurelessness, then, does not emerge as an inhibiting factor for these projects. In fact, for the *Omikron* project, its structurelessness, flexibility and de-institutionalization are considered by its producers its strongest assets in terms of its sustainability. Being a project constantly in motion, where a plethora of different people come and go, is considered by its producers the element that averts the danger of the project being shut down; instead, it increases the possibility that it evolves into something different. Structurelessness, however, proved less beneficial for *Radiobubble*, in the long run. In its current phase, *Radiobubble* seems to lurch compared to earlier phases of vibrant engagement of citizens and important achievements. In this case, structurelessness combined with rather spasmodic experimentation with many projects at the same time (live broadcast, podcast, citizen journalism on Twitter) and random choices of ways to secure resources did not increase the project's chances for sustainability. In the case of *Void Mirror*, what emerges as a rewarding strategy (like *10%* discussed above) is the creation of synergistic events, which continuously engage interested groups and individuals in meaningful activities.

In conclusion, the dialectical evaluation of the political economy of alternative media and their relationship with their audiences and communities adds further nuances to the questions of sustainability of these projects, evaluating various interdependent factors that impact the ongoing stability and health of alternative media. The findings of this research reveal a dynamic and contradictory field of less deterministic prospects than the ones implied by the Comedia's commercial strategy and the critique on it. Several resilient projects are situated in the very extreme edges of the research's two-axes spectrum, combining idealistic and pragmatic, or realistic and, more or less, puristic features. These reflections call for further research on how such hybrid practices are associated with their critical-oppositional character and deal with challenges and tensions that arise.

Appendix: Description of the Projects

*10%***:** established in 2000 as non-governmental organization (NGO); in 2004, it launched a print magazine which since 2006 is online only. It cov\ers LGBT issues, against gendered oppression (http://www.10percent.gr).

Anarxeio (2000): digital library of texts and publications that support the broad anarchist, anti-authoritarian movement (http://anarxeio.gr).

Athens Live (2015): independent on-the-ground source for stories, news and images about Greece (in English), cross-platform based—Facebook, Twitter, YouTube, Instagram and Medium (http://athenslive.gr).

Babylonia: launched in 2003 as newspaper, changed into magazine in 2011, and since 2015 online only (and publishing an annual print issue); supports the anti-authoritarian movement.

Black-Tracker (2006): counter-information web project sharing anarchist movement-related resources through torrents (http://www.black-tracker.gr).

Clandestina: launched in 2007 as website and since 2009 a blog of independent information for refugees and migrants coming to Europe (http://clandestinenglish.wordpress.com).

Infowar (2008): independent, critical, professional online news project (http://info-war.gr).

M (2012): anarchist news website (initially blog).

Omikron (2012): website covering the 'untold' side of Greece's crisis (http://omikronproject.gr).

Omnia TV (2011, originated in a blog formed in 2008): independent grassroots news platform, covering various social struggles (http://omniatv.com).

Radiobubble (2007): grassroots web radio—initially a music radio; then initiated a citizen journalism project; now an 'intergalactic radio' (http://radiobubble.gr).

RebelNet (2010): website and publisher (translations) of theoretical texts supporting the antagonistic movement (http://www.rebelnet.gr).

ResPublica (2015): online magazine of political and philosophical theory (http://www.respublica.gr).

Shedia: established in 2010 as a non-profit organization; in 2013, launched a street paper supporting homeless people.

Void Mirror: launched as website in 2004, since 2007 online magazine about the anti-globalization movement, initiated by the collectivity *Void Network* (http://voidmirror.blogspot.com).

CHAPTER 6

Hand-Made Memories: Remediating Cultural Memory in DIY Feminist Networks

Red Chidgey

In *Feminist Media: Participatory Spaces, Networks and Cultural Citizenship*, edited by Elke Zobl and Ricarda Drüeke, 87–97. Transcript, 2014.

> [A]mnesia about political movements is not only an innocent effect of general forgetfulness, but is socially produced, packaged, promulgated, and perpetuated.
>
> Rachel Blau DuPlessis and Ann Snitow, *The Feminist Memoir Project*

Feminist Cultural Memory in Grassroots Media

As DuPlessis and Snitow (1998) recount in no uncertain terms in *The Feminist Memoir Project: Voices from Women's Liberation*, the State and mainstream media do not typically guarantee collective memories of social justice movements, but subject them to distortion, domestication and erasure. Part of feminism's cultural battle is thus to secure the role of women's movements in popular memory (Heller 2002). Feminist media can become discursive 'weapons' in this struggle: to contest hostile framings and to put forward counter-understandings of what feminism is, what feminism can do, and who a feminist can be.

This chapter considers the practices and mediations of feminist cultural memory within the micro-political sphere of DIY feminist media networks. DIY (do-it-yourself) feminism refers to a loose network of cultural producers who draw their political coordinates from

BY-NC-ND

anarchism, anti-capitalism, Riot Grrrl, animal rights and queer cultures. Deploying both residual and emerging media forms, such as analogue and digital technologies, these feminists mobilize low-budget resources to create participatory political cultures and to preserve activist memory. The memory work that they establish—documenting their own social movements, critiquing dominant media representations, and making links to broader feminist praxis—creates much-needed counter-memories (Foucault 1977) and sites of feminist identification. Furthermore, these media channels (such as blogs, zines, videos, and podcasts) enact an archival function: they move feminist memory out of the realm of the institutional and create grassroots memory texts that are mobile, shared and networked.

Remediating Feminist Memory

I define feminist cultural memory here as the ways in whih past feminist movements are discussed and understood in the present moment, through the making and consuming of cultural artefacts. In considering cultural memory it is crucial to think about the practices and contexts of remediation. As conceptualized by David Jay Bolter and Rihard Grusin (2000), remediation analyzes how media content is shaped as it moves across medial forms, and how emerging and residual media and networks historically refashion eah other. The web, for example, refashions the book, magazine, radio, film, television, diary and personal letter. As remediation is multi-directional, these analogue forms and practices are also remediated by the digital. These refashionings happen through a double logic. As media forms multiply and are linked together, a logic of hypermediacy heightens the forms' materiality (for example, the user is made aware they are interacting with an interface). Where traces of mediation are erased in order to give a sense of real-time presence, the logic of immediacy is at play (suh as in the use of a webcam). Whilst hypermediacy dominates the web—with its audio-visual possibilities and hyperlinked information—both logics coexist in digital media.

Remediation is an important part of cultural memory practices. As Marianne Hirsch and Valerie Smith (2002: 9) put it, "Unlike the traditional archives of history, the archives of cultural memory consist not only of the stories, images, or documents of the past but also of the 'acts of transfer' without which we would have no access to them". How cultural memories are transmitted play an intrinsic role in how these memories are fashioned: cultural memory is socially, culturally, and medially produced. As Astrid Erll and Ann Rigney clarify, "Just as there is no cultural memory prior to mediation there is no mediation without remediation: all representations of the past draw on available media technologies, on existing media products, on patterns of representation and media aesthetics" (2009: 4).

In this chapter I explore the concept of feminist cultural memory in relation to two empirical examples: First, through a scrapbook produced by Riot Grrrl Pittsburgh member Nicole Emmenegger in 1996, which was digitized and published on her UK blog, Jenny Woolworth's Women in Punk Blog, in 2010. Emmenegger's cut-and-paste scrapbook is a visual record of mainstream, subcultural and personal framings of the youth feminist Riot Grrrl movement and highlights how remediation plays a key role in DIY feminist media production. My second example is the short animated video We Are Connected by Words and Wires (2009) by Belgian feminist Nina Nijsten. Through articulating feminist identification and action in the "here and now", I argue, this video breaks with post-feminist logics indicating the aftermath

of feminism, and re-imagines a historicized and still active feminist movement on a local and transnational level.

Riot Grrrl: Disputed Memories

An important trajectory within DIY feminism, Riot Grrrl is commonly seen as "a '90s third-wave-feminist punk subculture" that "spat out the image of girlhood in raw experiments in political activism, music, art, and self- invention" (Fateman 2010). Emerging in the United States in Washington D. C. and Olympia, Washington—and soon spreading to other cities and countries—Riot Grrrl was a decentralized youth feminist movement based around punk rock. Riot Grrrls organized conferences, consciousness-raising groups and street protests, dealing with issues suh as sexuality, abortion, rape, harassment, body image, eating disorders, self-harm, sexual abuse, and domestic violence. Beyond mainstream media coverage, Riot Grrrls communicated through their own media and music hannels. These independent networks became even more significant once prominent figures within the movement called for a "media blakout" at the end of 1992, following inaccurate and offensive coverage of Riot Grrrl within the mainstream press (Downes 2007; Marcus 2010). Riot Grrrl reclaimed feminism and fostered a girl-positive network that was both personal and political, introducing thousands of young women, men and queers to feminism.

Whilst the network's music output has received the bulk of the journalistic and scholarly attention, Riot Grrrl was also a scene of writing, art, protest, organizing and creativity, with isolated individuals often finding new groups and support. As Emmenegger tells me, "Riot Grrrl was all about DIY and singular experience within a collective shared moment" (2011). However, multiple instances of unexamined class and race privilege—and blatant classism and racism—wore out the appeal of 'girl love' for many by the mid 1990s. As Riot Grrrl historian Julia Downes notes, "Riot grrrl has been understood as a fashion, a phase, as punk, as dead, as violent, as man-hate, and ultimately, as failure" (2007: 12). The movement is commonly assumed to have fizzled out or been abandoned by the mid 1990s.[1] From Emmenegger's perspective, "There was a time after the 'movement' died out, say from 1998–2008, when there was hardly any mention of it [in the public sphere] except in ghostly remnants such as on a Spice Girls T-shirt or as a Halloween costume" (2011).

This metaphor of "ghostly remnants" seems particularly apt when thinking about the workings of cultural memory more generally: how historical moments are cited in increasingly stereotypical, fragmented, divorced traces, to the point where media representations, historical truth and cultural fantasy become utterly entangled. The commercially produced 'Riot Grrrl' Halloween costume that Emmenegger mentions, for example, is testament to how Riot Grrrl entered public consciousness in North America and how stereotypical assumptions of the "Riot Grrrl look" perpetuated within media accounts helped produce and calcify this awareness. Similarly, 'Girl Power,' the radical slogan of girls' agency and politicization that appeared in a Bikini Kill zine in 1991, became internationally popularized as the (commercial) slogan of the manufactured mid-1990s British girl pop band, The Spice Girls. As Downes

[1] For an overview of transnational and more recent Riot Grrrl practices in relation to zines, see the *Grrrl Zine Network* (http://grrrlzines.net).

notes, "Riot grrrls have had their messages and slogans co-opted, diluted and sold back in the form of girl-powered commodities and all-girl pop groups" (2007: 12).

Despite its underground or subcultural appeal, Riot Grrrl has not been altogether forgotten as a political movement. A renewed journalistic, commercial and archival interest in Riot Grrrl has erupted in recent years, signalled by the movement's twenty-year anniversary and its increasing institutionalization.[2] This public discourse has prompted reflection, documentation, interventions and counter-memories by Riot Grrrls and ex-Riot Grrrls. Women of colour activists have deconstructed and revisited the raced investments of whiteness and nostalgia surrounding Riot Grrrl appeals (Nguyen 2010).[3] Individual disputes concerning the 'official writing of Riot Grrrl' continue to take place on blogs, book review sites, and in newspaper articles (Fateman 2010; Wolfe 2010). And participants have deployed Web 2.0 sites to solicit a range of personal memories from others: to coincide with her Riot Grrrl historiography *Girls to the Front* (2010) Sara Marcus invited people to contribute short videos about the influence Riot Grrrl on their lives (http://www.girlstothefront.com/video.html). Similarly, members of the band Bikini Kill launched a blogging platform to collect and document multiple stories and rare ephemera of their DIY musical career with the help of their fans (http://bikinikillarchive.wordpress.com).

My Riot Grrrl Notebook:

Remediating Feminist Artefacts

Inspired by this renewed public interest in Riot Grrrl, Emmenegger created a three-part retrospective on her *Jenny Woolworth's Women in Punk Blog*, finding it "the opportune time to dig into my own archives and digitize a few lost bits of my personal riot grrl journey" (Emmenegger 2011). Her three posts include a list of Riot Grrrl archives and her digitized scraptbook (2010a); a digital version of an unfinished zine from 1996 ("with the aid of modern technology, here at last is the *Beri-Beri* lost edition!" [2010b]); and an interview with Riot Grrrl historian Sara Marcus (who was also Emmenegger's pen pal during the mid 1990s [2010c]). These posts document a vibrant, personal and mediatized legacy of Riot Grrrl, which still resonates for Emmenegger today. On uploading (and remediating) her teenage zine, she writes: "Embarrassing as it is for me to share this now, some fifteen years later, I have to say I am proud of what I accomplished then and still carry myself with that riot grrrl empowerment in everything I do" (Emmenegger 2010b).

Emmenegger created her Riot Grrrl notebook when she was nineteen years old, "to preserve and catalog all these various scraps" (Emmenegger 2011). A thirty-one paged spiral bound scrapbook, the front cover has "my riot grrrl notebook" doodled over strips of white

[2] Whilst there are too many instances of newspaper articles, films, exhibitions and books to mention here, see Feminist Memory (http://feministmemory.wordpress.com/2010/10/25/riot-grrrl-media-timeline) for an ongoing, interactive chronology. Riot Grrrl has also enjoyed renewed interest in connection with Ladyfest events—transnational arts and activism festivals launched in 2000 by some of the key players of the early 1990s U. S. Riot Grrrl scene.

[3] For an analysis of race and class dynamics in DIY feminist networks, see *Race Revolt* (http://www.racerevolt.org.uk), *Thread and Circuits* (http://threadandcircuits.wordpress.com), and *make/shift* (http://www.makeshift-mag.com).

masking tape and is decorated with Riot Grrrl aesthetic codes such as stars, female paper-chain characters, and the women's symbol (♀). Produced as part of Emmenegger's 'Feminist Presses' course at Antioch College in Ohio, this document enacts a personal 'talking back' to dominant discourses, and was originally shared with Emmenegger's professor, classmates and friends in its analogue form. [4]

This document is a rich historical resource: articles clipped from mainstream publications such as *Newsweek*, *Spin*, and *New York Times* sit alongside underground magazine offerings like *Your Flesh* and feminist coverage from *Ms Magazine* and *Off Our Backs*. All the articles are deconstructed, with sensationalist and sexist comments highlighted. The *Newsweek* article, for instance, is discussed as "a carbon copy of every other bit in the press. There are obligatory references to Bikini Kill [. . .] There is a picture of an anonymous girl with words written on her stomach and arms, displaying the grrrl tendency to use our young white bodies

Figure 1. 'Talking back' to mainstream media discourses in "my riot grrrl notebook"
Image courtesy of Nicole Emmenegger

as confrontational billboards. And there is mention of messy, raw, angry zines that all grrls do. This article is a mass of stereotypes and misinformation and half truths" (see Figure 1).

To counteract the inaccurate, sensationalized (and deradicalized) coverage in these collected media clippings, Riot Grrrl flyers, manifestos and images were also included in the scrapbook, with Emmenegger adding clarifications to the off-page context and resonance of this cultural ephemera. [5] Like zines, which also document 'the movement', Emmenegger's scrapbook acts as an important counter-memory to mainstream media accounts by contesting patronizing frames of teenage rebellion and providing narratives against trend-orientated

[4] See Piepmeier (2009: 29–32) for an analysis of su□ragette scrapbooks in relation to DIY feminist publications.

[5] Such texts need to be contextualized, interpreted and triangulated with other sources to ensure their historical veracity.

approaches in the press. As Emmenegger comments, "The mainstream press needed a leader, a manifesto, a clear path and that is just not what it was about" *(2011)*.

As a form of feminist memory, it is not only the content of the scrapbook that is significant here, but also the process of digitization. Whilst Alison Piepmeier notes that "zine creators don't necessarily view blogs as a replacement for zines but, instead, as a supplement, a format that's doing something slightly different" *(2009: 14)*, I want to emphasize how DIY feminists are using strategies of remediation to bring their hand-made artefacts online, in ways which maintain *(to some extent)* the 'feel' of their cut-and-paste culture.

When digitizing her scrapbook, Emmenegger scanned the document in full colour including the visual trace of the spiral binding holding the notebook together. She then uploaded her file onto the digital publishing platform *Issuu (*http://issuu.com*)* in a format which allows the pages to be flipped through in a codex form, mimicking, as far as possible, the experience of holding the scrapbook in one's hand. This process enacts logics of immediacy and hypermediacy: the digitization of the scrapbook is muted in the interface *(the flip-book feel of the viewing medium providing a different reading experience to a rigid, downloaded PDF file, for example)* whilst the juxtaposition between the yellowing pages of the document and the detemporalized internet platform hosting it *(where documents do not physically age or deteriorate)* serves to emphasize the historical materiality and 'aura' of the original artefact.[6]

Through choosing a process of digital remediation which draws on the DIY impulse towards sharing documents and creating embodied media forms (*Piepmeier 2009*), this act of archiving and transmission is embedded within the "perceptual frames, affective attachments, [and] ideological pre-givens" *(Straw 2007: 3)* of the hands-on maker culture from which it originates, whilst also embracing the representational and archiving possibilities of the digital.[7] Such strategies lend legitimacy to the counter-memories being archived on Emmenegger's blog.

We are connected by Words and Wires: Re-Imagining Feminist Histories

Nina Nijsten's short animated film, *We Are Connected by Words and Wires*, similarly takes the themes of legacies and participation as its core message. Consisting of sixteen illustrated slides edited to a self-made soundtrack, this three minute film provides a definition of DIY feminism ("We can do, make, and organise anything. We don't have to be 'professionals'"), alongside a visualization of the maker's personal history within the scene and references to 'sister' feminist history actions past and present.

This is also a story of activation. The filmmaker is shown surrounded by zines and books, believing "the diy feminist movement was active long ago and far away" (see Figure 2). New media is then depicted as helping to forge cross-border connections between the still thriving movement, as the filmmaker-protagonist finds feminist groups and publications via the

[6] Websites can show signs of aging, however, through pages or items no longer accessible to the server, as flagged by 'page not found' or 'image not available' messages.

[7] Such remediation techniques illustrate peer-led methods for capturing, storing and transmitting feminist ephemera online, reflecting the embodied, cultural economies behind the artefacts' production and reception. PDFs (Portable Document Format) also have important transmission and archiving roles. As my correspondence with Nijsten attests to, PDFs can be considered "closer to hand-made/printed zines," being "easier to print and easier to save on a computer," and therefore "more tangible" (Nijsten 2011b). Digital archiving projects might do well to combine both formats: the presentation aspect of flipbooks and the archival and circulatory strengths of downloadable PDFs.

Figure 2. Remediating cultural memory to activate feminist participation. Slides from *We Are Connected by Words and Wires*

Image courtesy of Nina Nijsten

internet and starts local actions of her own—learning that she too "can participate". Residual (that is, 'old-fashioned' and analogue) media forms such as letters, zines, cassettes and hand-drawn comics are also shown as communication tools between feminists, demonstrating some low-cost entry points for producing feminist media. To rally counter-memories against the myth of post-feminism, Nijsten illustrates an annotated map of the contemporary feminist network, citing a range of zines, groups and events such as Ladyfest (South Africa), *Fallopian Falafel* (Israel), *Jawbreaker* (Philippines), *cyber-femin-club* (Russia), *Mujeres Creando* (Bolivia), and *Cherry Bomb Comics* (New Zealand) as examples of a new transnational feminist movement (see Figure 3).

Figure 3. Emerging and residual media are used in DIY feminist networks to communicate globally. Slides from *We Are Connected by Words and Wires*

Image courtesy of Nina Nijsten

An amateur production, Nijsten's video documents cultural reference points that opened up DIY feminism for her personally. By citing little known groups and publications, the filmmaker also creates the seeds of a feminist memory consciousness. This is not straightforward representation, however. The animation showing Nijsten sitting amongst her books (Figure 2), name-checks publications like *Girl Germs* (an early Riot Grrrl zine), *Suffragettes To She-Devils: Women's Liberation and Beyond* (a visual history of feminist graphic design), *Notes from Underground: Zines and the Politics of Alternative Culture* (an academic study of zine networks),

The Power of Feminist Art (an analysis of 1970s feminist art in the United States), and "Dolle Mina," which refers to the *Het Rode Boekje Van De Vrouw(en)* ("The Little Red Book of Women/Woman", a liberationist text by the Belgian feminist group Dolle Mina published in the early 1970s). The slide also shows a book about anarchist-feminist Emma Goldman (1869–1940) that was not itself based on any text that Nijsten had read or come across, but was included to pay homage to an inspiring historical figure and to underscore the anarcha-feminist roots of today's DIY political cultures (Nijsten 2011a).

Furthermore, the oversized "Riot Grrrl Herstory" book shown in this slide may have been influenced by a recent publication at the time (Monem 2007), but the title and cover is pure fabrication (Nijsten 2011a). To interpret this further, the "herstory" title (which does not appear on any mainstream books on Riot Grrrl) links Riot Grrrl to radical feminists of the late 60s onwards, who re-inscribed "history" as "her story" to draw attention to the male bias of the historical record. Furthermore, the cover image of a woman of colour tacitly draws attention to hegemonic and repetitive accounts of Riot Grrrl in which women of colour's voices and participation are routinely marginalized or erased. For example, in the handful of books related to Riot Grrrl that have been commercially published in recent years, many sideline the voices and input of women of colour, and all depict only white women (predominately from the band Bikini Kill) on their covers—evoking Emmenegger's 1996 scrapbook commentary on the *Newsweek* article, cited above, about the whiteness of Riot Grrrl in its tactics and in the media imagination; a critique long-held by women of colour within the Riot Grrrl movement yet still not secured within Riot Grrrl historiography.

We Are Connected by Words and Wires is a mobile text. Nijsten's video has received close to 800 hits on YouTube at the time of writing and has been screened internationally at grassroots and institutional settings such as the Civil Media UnConference (Austria), Ladyfest Liège (Belgium), Gender Fuck Festival (Czech Republic), London Lesbian Gay Film Festival (U. K.) and the Elles Tournent feminist film festival (Belgium) (Nijsten 2011a). Its title, "We Are Connected by Words and Wires," not only reflects the technologics increasingly associated with third wave feminism (Garrison 2000), but also speaks to the logic of immediacy. As Bolter and Grusin (2000: 226) note with regards to remediation, "the promise of 'connecting to other people' suggests transparency—breaking through the medium to achieve human contact". By foregrounding the "happening here and now" aspect of do-it-yourself culture, Nijsten deploys this logic of immediacy as a source of activation, alongside the hypermediality of a mediatized activist culture. This double logic works to promote contemporary feminist identification, participation, and cultural production in the present moment, whilst creating links to an international politicized and historicized feminist past.

Concluding Remarks: Feminist Cultural Memory as Political Consequence

Activists have greater possibilities for researching, producing, and disseminating their own memory texts with Web 2.0 innovations. By deploying emerging and residual media forms via the internet, for example, DIY feminists create personal and remediated cultural memories that serve to reinvigorate feminist engagement in the present through providing links to historical-based resources around suffrage, civil rights, women's liberation, anarchism and riot grrrl. By sharing personal stories of feminist activation and creativity, DIY feminists also

narrate the cultural reference points that signal 'inclusion,' 'authenticity' and 'participation' in these networks.

In Nijsten's video, Emmenegger's scrapbook, and countless other feminist zines, blogs, and grassroots projects, tentative counter-memories are therefore produced, cited, and circulated, creating new archives of meaning whilst also revisiting residual investments. These counter-memories draw on mainstream media accounts, challenge them, and further appropriate commercial platforms such as YouTube and Issuu to popularize and disseminate personal narratives held in a collectivity.

While this chapter has considered the techniques and implications of remediation, it is important to sound a broader note in this chapter's conclusion. An uneven terrain, feminist cultural memory embraces the experiences, artefacts, stories and also silences—from the personal to the institutional, and always mediated—that shape identities, structures of belonging, and affective economies. As such, memories have political consequences.

As third wave feminist histories are still in the making, further documentation and assessment is needed to account for what versions of the feminist past, present and future are being circulated, by which actors, for what purposes, and with what resources. As feminist cultural memory is a site of contestation, it is important to consider how conflicts are narrated and legitimated within these networks, especially when these narratives pass into institutions and are further secured. Challenges ought to be made to DIY feminist narratives around empowerment and participation, for example, whenever celebratory story arcs risk muting antagonism from within.

As to the role of feminist cultural memory in activist networks more broadly, mediated memory can help map resistance struggles and offer feminists much needed resources to imagine alternative possibilities. Re-mediating political memory can also help alleviate strains of amnesia and déjà vu under late capitalism, forces which threaten present day mobilizations for social justice by robbing us of our feminist heritage and diverse connections to the past.

CHAPTER 7

Being a Child of the Mines: Youth Magazines and Comics in the Copperbelt

Enid Guene

In *Across the Copperbelt : Urban & Social Change in Central Africa's Borderland Communities*, edited by Miles Larmer et al., 52–76. James Currey, 2021.

Introduction

The Copperbelt has many claims to fame, not least among them the various forms of popular art that developed there over the course of the past century. As it grew in scale, the mining industry threw up a spattering of new urban centres to which large numbers of people from myriad cultural and linguistic backgrounds flocked, thus providing ample fertile ground for new creative endeavours. Perhaps best known among such endeavours is what has become known as 'Congolese Popular Painting': a new approach to figurative painting which gained prominence in the mid-twentieth century and is known for its brightly coloured depictions of the daily lives and struggles of the Congolese people. Yet, there existed another type of popular art which, though it did not achieve quite the same level of international recognition, was no less prevalent on the Copperbelt: comics (*bandes dessinées* in French). Not only were comics of all kinds widely read on the Copperbelt, but Katanga and Zambia have also seen the creation of several widely available and influential youth magazines that published popular comic strips. In September 1964, Katanga's all-powerful mining company, the Union Minière du Haut-Katanga (known as Gécamines after independence), launched Mwana Shaba Junior, its very own magazine for the youth. The magazine, which had a peak print run of 41,500 copies in the 1980s, was distributed monthly to the families of every Gécamines employee for free.

BY-NC-ND

Meanwhile, from 1971, Zambian children had access to *Orbit* ('The magazine for young Zambians'), a magazine with an initial print run of over 65,000 copies, [1] which was commissioned by the Zambian Ministry of Education to be circulated in schools across the country. This was followed in 1984 by *Speak Out!*—a bimonthly produced by the Franciscan Mission Press in Ndola with a distribution of 40,000. [2] Not only are these magazines some of the longest-lasting comic magazines on the continent, thus allowing large numbers of children to engage with the medium of comics over an extended period of time, but they also provided local talents with the chance to produce their own.Yet Zambia is not known for its comics at all, while the Katangese Copperbelt continues to be much better known for its popular paintings.

As will be shown in this chapter, comics were a key component of a childhood spent on both sides of the Copperbelt's border. They had played an important role in the imaginative development of the Copperbelt youth even before any of these magazines were published, which, in time, allowed key institutions—in this case, a powerful mining company, the Zambian State and the Catholic Church—to use the medium for their own purposes: as a tool to convey specific messages and values. At the same time, while comics were originally an imported medium to the Copperbelt, and were usually produced to 'educate' or 'steer' their African audience in a certain direction, their target populations were by no means passive consumers. In fact, *Mwana Shaba Junior*, *Orbit* and *Speak Out!* availed the primary space for comics in the region and provided aspiring Copperbelt cartoonists with the opportunity to 're-appropriate' and transform the medium. Crucially, this reappropriation took place against the backdrop of the fast economic, political and social changes that followed the dramatic downturn in copper prices of 1974–75. In this context, comics became an avenue through which to have 'conversations' about these changes. In this way, as will be argued, a medium which had previously been actively deployed to promote a vision for an industrial and 'modern' future became a tool to critique the failures of modernity and the corrosive effects of economic decline.

The Comic Cultures of the Zambian and Congolese Copperbelt

At first glance, there appears to be a clear 'comics division' between the Democratic Republic of the Congo and Zambia. Nancy Rose Hunt argued, based on a meticulous study of magazines and newspapers from colonial Congo, that 'comic imagery flourished in Congo in the 1930s, not only in cities but wherever newspapers travelled'. [3] Similarly, according to Andreas Knigge, Congo was the only African country to have started to develop its own comic culture as early as the 1940s. [4] Independent Congo, for its part, has been associated with an explosion of comic forms, ranging from development comics, to Mobutu's life story, and to ephemeral street comics, and has produced some of the continent's best-known comic artists including the man whom the British Broadcasting Corporation (BBC) described as

[1] According to the *The Europa World Year*, it was published about nine times a year.

[4] Andreas C. Knigge, *Vom Massenblatt ins multimedia Abenteuer* (Hamburg: Rowohlt, 1996), p. 238.

'the Congolese author best known outside his country', Barly Baruti.[5] In contrast, English-speaking Southern Africa, excepting South Africa, has produced few prominent comic artists.[6] Congo's early start in comic-making has been linked to both the popularity of comics in Belgium and their resulting availability in the Belgian Congo,[7] and the fact that they were quickly identified as a useful teaching tool in colonising educational projects. Semi-didactic comics for Congolese audiences proliferated in the post-war period, especially in Catholic (or Catholic-influenced) newspapers and magazines. Perhaps the most striking example of this didactic brand of comics was *Les aventures de Mbumbulu*, a series created in 1946 for the state-published—though missionary influenced—magazine Nos Images. Each Mbumbulu 'story' ended with a moralising sentence, such as 'on reflection, he understood that in order to be able to complete a job successfully, one must be prepared for it',[8] or 'beware of magicians and witch doctors, they make a living at your expense'.[9] Nothing of the kind is known to have existed in colonial Zambia, though this may in part be due to lack of research on the topic.[10] Yet, oral evidence collected on both sides of the border suggested that by the 1960s and 1970s, the inhabitants of the Copperbelt had access to the full range of whatever comics were available in the British and Belgo-French markets at the time, and more besides.

Jacky Mulenda, for example, who worked for Mwana Shaba Junior in the 1980s, remembers from his childhood in the 1960s and 1970s that 'everything was there: Bécassine, Spirou and Tintin [comic strips], Tintin and Spirou magazines as well'.[11] Other comics which informants recalled reading in the same period included Lucky Luke, Ric Hochet, Buck Danny, La patrouille des Castors, The Smurfs, Alix, Gaston Lagaffe and Bob et Bobette, the latter a French translation of the Flemish series Suske en Wiske. In other words, Katangese readers were familiar with the full range of mainstream comics published in Belgium in the middle decades of the twentieth century. As Jacky Mulenda recalled,

> You know when we read Lucky Luke, my older brothers always sat down on the ground to read them. Then, we would hear a burst of laughter. It was because of the tomfoolery of the Dalton brothers [characters in Lucky Luke].You would hear several waves of laughter as the jokes came in the story. They were in stitches.[12]

[5] Thomas Hubert, 'Capturing Kinshasa through Comics', BBC, 2011, www.bbc.co.uk/news/world-africa-11996279 (accessed 19 July 2020).

[6] According to comic scholar John A. Lent, as far as the Southern African region is concerned, South Africa and Tanzania 'stand alone in all aspects of comic art'. See John A. Lent,'Southern Africa: Hardly a Cartoonist's Eden' in John A. Lent (ed.), *Cartooning in Africa* (New York: Hampton Press, 2009), pp. 219–46, p. 223. South Africa has spawned some of the continent's best-known comics, including Zapiro's political cartoons, comic strip *Madam and Eve*, and the underground-style *Bitterkomix*. Tanzania is known for its Swahili comics and cartoons, some early examples of which may have been influenced by Congolese magazines. See Jigal Beez, 'Stupid Hares and Margarine: Early Swahili Comics' in John A. Lent (ed.), *Cartooning in Africa* (New York: Hampton Press, 2009), pp. 137–57.

[10] Several magazines and newspapers published for Africans were circulating on the Zambian Copperbelt in the early 1960s, some produced locally, others imported. It may be that closer examination of this literature would reveal cartoons and comics. See Hortense Powdermaker, *Copper Town: Changing Africa* (New York and Evanston: Harper & Row, 1962), pp. 281–2, p. 340, p. 367.

[11] Interview, Jacky Mpungu Mulenda, Lubumbashi, 14 August 2019.

[12] Ibid.

Similarly, British comics loom large in the memory of Zambian informants who grew up on the Copperbelt prior to the 1990s. Most read *Andy Capp*, a funny strip centred on a wife-beating figure who never works, and Garth, an immensely strong hero who battles various villains across time and space. Both were originally published in the British Newspaper *Daily Mirror*, from 1957 and 1943 respectively, but also appeared in the *Times of Zambia*. Their presence in a national newspaper made them eminently accessible, and several informants remembered having kept a scrapbook. As one recalled, 'I never wanted to miss those … I actually used to cut them out and paste them into an old phone book.'[13] In addition, when prompted about the comics they read as children, informants on the Zambian Copperbelt almost invariably first cited *Dandy* and *Beano*, two children's comics published by the Scottish publisher D.C. Thomson since 1937 and 1938 respectively. Angel Phiri, a comic enthusiast who now works in the televisual field, noted that *Dandy* and *Beano* 'were the go-to magazines for children. If you were bringing anything for the kids, it would have been those.'[14] D.C. Thomson's main rival in the world of British comics, Amalgamated Press *(renamed Fleetway Publications in 1959)*, appears to have been popular in the Copperbelt too. In the 1950s, Amalgamated Press had introduced the 'Picture Library' format, which consisted in one long complete story set in one of several set genres: westerns, detective/thriller stories, sport, science fiction, and war.[15] Peter Kapenda, a cartoonist who later contributed many drawings to *Orbit*, was very fond of 'Fleet Street comics', particularly 'Second World War and detective comics', which, he says, inspired the development of his own style:

> I had a lot of influence from the British comics, the Fleet Street comics…[what inspired me was] the way they told the stories, especially the war comics [and] the artwork. There were some artists who were very good at line drawings. Just black ink on white.[16]

Access to such literature must, in part, have been facilitated by the presence of libraries and bookshops across the mining towns. Even Gécamines' social centres *(known as 'cercles')* and youth centres had their own little libraries. Dominique Ilunga, who worked as a librarian for one of Gécamines' cercles in the 1960s and early 1970s, recalled that comics such as Bob et Bobette and Tintin were his library's most popular items, among adults and youths alike. Gécamines did not pay for these books however. Instead, 'we would go to houses of the Europeans, or of the Congolese who liked to read. [We would collect] the books they had already read to add them to our library collection.'[17] On the Zambian side, while council and mine libraries reportedly prioritised novels over comics, one significant exception was the Hammarskjöld Memorial Library, which is attached to the Mindolo Ecumenical Foundation in Kitwe. This was a well-equipped library, which had opened in 1963 with funds from Sweden, and which, crucially, children could access for free.[18] As Angel Phiri recalled, 'almost half of Kitwe used to borrow books there':

[16] Interview, Peter Kapenda, Ndola, 18 July 2019.

[17] Interview, Dominique Ilunga, Likasi, 10 August 2019.

[18] *Orbit*, 1, 6 (1971), p. 12.

> For me, [the Hammarskjöld library] was like a paradise. Almost half the time, as long as you are out of school, you would go to the library. If you are not playing soccer, you would go to the library. If it's a holiday, the first thing you'll think about is the library. [19]

It is, however, a bookstore which seems to have played the most crucial role in disseminating comics on the Zambian Copperbelt: Kingstons Ltd. The successor to Herald Stationery and Book Store which had established bookstores in Kitwe and Ndola by the 1930s, [20] Kingstons was Zambia's main source of newspapers, records, books, magazines, and comics, and was probably the main route via which D.C. Thomson and Fleetway Publications were distributed in Zambia.This is borne out by the fact that Fleetway comic magazines were published with a note stating that their 'sole agent' for 'Rhodesia and Zambia' was 'Kingstons Ltd'.This also chimes with informants' recollections that 'Kingston was … the source of everything' and 'the sole supplier and distributor of all books from abroad'. [21] Cartoonist Peter Kapenda recalled:

> When magazines came from the UK, they were supposed to sell them for a certain period. If they didn't sell all of them, they used to tear them so that people would not be able to read them and then throw them in the rubbish dump. That's where the boys used to go and pick them up. [22]

In this way, via bookshops and libraries, and as children shared their comics with each other, comics circulated widely on the Copperbelt, reaching even children who did not necessarily have the means to buy books first-hand.

In addition, when asked about what imported comics he read, Angel Phiri immediately came up with a list which suggested horizons going beyond what the former colonial powers produced:

> If you are going to talk about imported comics we had a lot of them. You had *Beano, Dandy, Asterix, Tintin, Apache, Archie and Sabrina ... We had Marvel and DC comics. All those things used to be around and used to have a lot of influence.* [23]

This short list is enough to give an idea of the breadth of material on offer: *Beano* and *Dandy* are from the United Kingdom; *Archie* and *Sabrina* and Marvel and DC Universe are from the United States. *Tintin* is from Belgium, *Asterix* from France, and *Apache* is a photocomic from South Africa. It is perhaps significant that the informants who grew up before the 1960s do not remember seeing any translated Belgo-French comics, as this more or less corresponds to the period when these comics were first translated into English. [24] According to Austin Kaluba, a cultural journalist at the *Times of Zambia*, *Asterix* and *Tintin* were easily obtainable from Kingstons, circulated in schools and were 'massively popular'. He went as far as saying that 'you have not lived in Zambia if you have not read *Asterix* and *Tintin*.' [25] Similarly, American comics were, by all accounts, largely available on both sides of the border. Even

[22] Peter Kapenda interview.

[23] Angel Phiri interview.

[24] The full process of translating *Tintin* into English was commissioned in 1958 by Methuen, Hergé's British publishers, while the first translated album of Asterix was published in 1969 by Brockhampton Press. Other comics of Belgian origins which Zambian informants cited were *Lucky Luke* and *The Smurfs*.

[25] Interview, Austin Kaluba, Lusaka, 1 July 2019.

the oldest Zambian informant, who grew up in the 1950s, remembers reading *Popeye,* as well as Disney and superheroes comics (Marvel and DC universe) such as *Batman*, *Superman* and *Spiderman.* In Katanga, Jacky Mulenda recalled that,

> [Superheroes comics] were always in the A5 format and every other page was printed in colour and the others in black and white. I did not know their origin … But they did not interest us much … We were used to comics published in colour and we preferred humorous characters. [26]

In turn, South Africa's main contribution to the Copperbelt's comic culture, at least that of the Zambian Copperbelt, came in the form of photocomics. These enjoyed enormous popularity in South Africa in the 1960s, 1970s and 1980s. [27] In Zambia, according to informants' recollections, the most popular ones were: *Lance Spearman* (aka 'The Spear'), a super-spy character, created in 1968 by Drum Publications; *Chunky Charlie*, a funny inspector character who carried fancy gadgets in his huge coat; and *She*, described as a 'kickass character' who 'was always in a miniskirt with an afro and very high boots'. [28]

From the mid-twentieth century, and especially from the early years of independence, comics circulated on the Copperbelt in many forms. The breadth and diversity of comics in circulation meant that the cultural trends that influenced Copperbelt children were equally wide. They consumed swashbucklers from the United Kingdom, and glossy adventure or humorous *bande dessinée* albums from France and Belgium, sword-and-sandals stories of ancient Rome and cowboy tales of the American West, photocomics from South Africa, and superheroes from America. Although comics appeared in Congo earlier than in Zambia, by the 1960s, they were a key part of the experience of growing up on both sides of the Copperbelt. Many children cut and pasted comic strips, redrew them, played games involving comic book characters, discussed them at school, and lent each other comic books. The fact that Copperbelt children were not passive readers of comics, but instead, played around with them, is an indication of how popular the medium was and how important a part it played in a Copperbelt childhood. In turn, the fact that a certain number of prerequisites were needed for comics to circulate, such as a knowledge of French or English or the presence of specific bookstores, made sure that comics would be, if not necessarily a Copperbelt-only phenomenon, then at least a mostly urban, and fairly middle-class, one. Henry Chitaika recalled that when he lived in Ndola with his parents,

> [I would] buy comics from Kingstons and start drawing with my friends. Even in class sometimes we'd exchange drawings—*Doctor Strange, Captain America, Spiderman. But when we moved from Kansenshi [an affluent neighbourhood] to Chifubu [a poorer township] I noticed that it was a bit different. My friends, when they saw me do this ... it was like magic to them. Even the books when I took them out they couldn't even say, 'Oh, can I read your comic for a few days, I'll bring it back.' No.They would just look at them.The interest wasn't there.* [29]

Still, in the 1960s and the early 1970s, a time when both Copperbelts were experiencing a period of economic boom and its populations enjoyed a comparatively high quality of

[26] Jacky Mpungu Mulenda interview.

[29] Henry Chitaika interview.

life, the situation was ripe for various institutions to use this very popular medium for their own purposes, as the Catholic Church had already been doing for decades in the Congo. By this point, the youth of the Copperbelt had been exposed to a large variety of comics from various horizons while at the same time a large pool of disparate tastes had developed. This, therefore, is the background against which Gécamines and the Zambian State launched their respective youth magazines: *Mwana Shaba Junior and Orbit.*

Mwana Shaba Junior and Orbit: Science, Paternalism and Expectations of Modernity

In September 1964, UMHK, soon to be renamed Gécamines, became the first Katangese company to produce its own youth magazine, Mwana Shaba Junior. Some seven years later, in January 1971, Orbit was born in Zambia. Though it was originally developed in 1970 under the aegis of Valentine Musakanya, then Minister of State for Technical Advocational Education, Orbit quickly received its own Civil Service department under the Ministry of Education. Despite their different origins, there were significant similarities between the two magazines. Both were educational and sought to ignite interest in science and technology, and both therefore dedicated a significant amount of space to illustrated articles on these subjects as well as history, geography and sport. Yet there were also important differences in tone. When it was first conceived, Orbit's main intended purpose was, in the words of Wendy Bond, one of the creators of the magazine, to 'lay a really secure technical foundation for every child'.[30] This was a very important cause to Valentine Musakanya, who, unlike most prominent members of the Zambian Government at the time, including President Kenneth Kaunda, was known as an opponent to Africanist models and insisted that the future of Zambia lay in the use of Western technology.[31] Mick Bond, Wendy Bond's husband, recalls Musakanya saying: 'When science and technology replace witchcraft, as they must, here, everyone should have the knowledge to understand them and not blindly believe, changing one superstition for another.'[32] There was also a certain emphasis on agriculture. Wendy Bond was expressly asked to include a permanent 'Young Farmers' Club' section by the Ministry of Agriculture,[33] as it was keen to reduce the country's dependence on imported food. The section offered practical agricultural advice and featured many variations on statements such as 'whatever you do in the future, you will be a richer man if you can grow food. … it is useful not just for you—but also for Zambia'.[34] Created as it was at a time of economic expansion, when the future was envisaged as prosperous and technologically advanced, Orbit was designed to steer the youth towards the advanced employment opportunities which the Zambian Government expected would soon need filling.

[34] *Orbit, 4, 3, 1975, p. 22.*

While *Mwana Shaba Junior* similarly sought to steer the eyes of the youth towards science, technology and, by extension, the mining industry, it went further. *Mwana Shaba Junior* was published as a supplement to *Mwana Shaba* ('Child of Copper'), a free monthly magazine created in 1957 by UMHK for its employees. Both magazines were part and parcel of the distinctive brand of corporate paternalism which the Union Minière had pursued since the 1930s but which, with the looming prospect of Congolese independence, was going through a new phase of intensification in the late 1950s. While *Mwana Shaba's* role was to give company-related news, it also took pains to paternalistically emphasise topics such as the importance of discipline at work, a stable family life, and good behaviour. In other words, it played the role of 'moralizer of the population', as Donatien Dibwe dia Mwembu put it.[35] *Mwana Shaba Junior* was intended to play much the same role for the next generation of Gécamines employees. Every issue was introduced by an editorial, which, in the magazine's own words, intended to give young people 'moral, cultural and scientific' advice.[36] These editorials cover a wide range of topics but it is the related themes of the importance of education and discipline which come through the most frequently and the most clearly. One editorial entitled 'La réussite' *('How to achieve success')* stressed that 'the path to success necessarily involves regular effort', and with 'effort' comes 'suffering, pain and sacrifice'.[37] Even articles on sport were turned into another opportunity to draw an analogy between discipline and success: 'What matters if you want to achieve anything is discipline: to love making effort, work with perseverance, respect the property of others, observe the rules which are necessary for society to function properly'.[38] *Mwana Shaba Junior* thus displayed a rather explicit brand of didacticism, the aim of which was to produce the hard-working employees of tomorrow while encouraging the Gécamines population to think of itself as a community with common interests.

These divergences in tone and choice of emphasis were reflected in the comics *Junior* and *Orbit* chose to publish. Comic strips published in *Junior* were fully incorporated into the magazine's overall didactic mission: they were to serve, as the editorial team of the March/April 1988 issue revealingly put it, 'as a support for the instruction and moral education of the young honest citizens of tomorrow'.[39] In this, they recycled the paternalistic and moralistic qualities typical of colonial comics but also of the mid-twentieth-century Belgian comic tradition as whole. Partly because of the influence of the Catholic Church and partly as a reaction to France's very strict 1949 censorship law which closely regulated depictions of sex and violence,[40] Belgian comic artists carefully policed their work, producing comics intended to entertain the youth, but also to educate it, and to offer it good role models. Accordingly, the first comic strips published in *Junior* were realistically drawn stories set in antiquity, such as *L'histoire merveilleuse,* which depicted the lives of various Biblical characters, and *Ben Hur*

[40] This had been enforced in response to the post-liberation influx of American comics, as a thinly veiled measure to protect the domestic comic market. It also came in handy to regulate the availability of Belgian comic magazines in France. See Philippe Delisle, *Bande dessinée franco-belge et imaginaire colonial, des années 1930 aux années* 1980 (Paris: Karthala, 2008), p. 6.

(1965–67), which broadly told the same story of revenge, redemption and Christian awakening as the 1959 Hollywood film of the same name.[41] Along with these, *Junior* introduced in September 1965 a humorous series called *Les aventures de Mayele*, which quickly became the magazine's flagship series. *Mayele* (meaning 'clever' in Swahili) was originally invented by two Belgian Union Minière engineers called Theo Roosen and Paul Baeke. That the makers of Mayele were influenced by the Franco-Belgian tradition is obvious. Mayele is friends with two young adolescents, a boy and a girl, who are dressed just like the two heroes of the Flemish comic *Suske en Wiske.* His 'adventures' consist of one-page gags, with many of the jokes drawing on slapstick-type humour and the main character's clumsiness, just like *Gaston Lagaffe*, a lazy and accident-prone character from the *Journal de Spirou*. Mayele is an urban young man who owns a dog, and whose 'adventures' take place in the realistic setting of a person's 'normal' everyday life, as they do in the series *Boule et Bill.* For example, in 'Pas de chance!', Mayele finds himself stuck between his garage door and ceiling in an attempt to show off his new electric garage door to his neighbour[42] Mayele lives in a big suburban house, owns a car and various technological items, which provide the basis for much of the hilarity *(as they malfunction).*[43] He lives in a city, where he has arguments with friends in cafes,[44] clashes with policemen,[45] and goes to football matches.[46] Mayele's stories, in other words, are largely aspirational aimed at an *(aspiring)* African middle class in the purest tradition of both Gécamines' and mid-twentieth-century Belgian comic paternalism.

The first comic strips published in *Orbit* were more graphically sophisticated than what appeared in *Mwana Shaba Junior,* despite Congo's supposed head start in comic-making, because they were produced by professional cartoonists. Wanting the magazine to be professionally produced, Valentine Musakanya had elicited the help of Peter Clarke, then Managing Director of the London-based news service GeminiScan Ltd. As a result, though the editorial copy was provided by the Zambia-based team and the magazine was printed in Zambia,[47] all the artwork and editing were done in Britain by British artists commissioned or employed by GeminiScan. That this was the case was kept as discreet as possible. 'One of the many things Peter insisted on was that there should be no indication to the young reader that *Orbit* was being produced in the UK', John Egglesfield who was art editor for GeminiScan, recalled. 'We wanted all the focus to be on Zambia.'[48] Thus, though John Egglesfield elicited the services of some of Fleet Street's finest cartoonists and illustrators to produce the comics, their names never appeared in the magazine. 'Space Safari', *Orbit*'s flagship series which featured two Zambian heroes named Marion and Robert, was a space adventure written by Sydney Jordan

[41] *Mwana Shaba Junior*, 14 February 1966, p. 7.

[42] *Mwana Shaba Junior*, 126, 15 May 1972, p. 1.

[43] E.g. in 'Mayele tond sa pelouse' (*Mwana Shaba Junior*, 82, 15 April 1970, p. 1), Mayele gets angry because he thinks the lawnmower his neighbour lent him is faulty when the issue is that he did not pay his electricity bill.

[44] E.g. in 'Elles existent' (*Mwana Shaba Junior*, 178, December 1974), Mayele argues with a friend about whether 'flying saucers' exist, irritating another customer who throws his saucer, a 'flying saucer', at them.

[45] E.g. in 'Une bonne occasion' (*Mwana Shaba Junior*, 57, 15 February 1969, p. 1), Mayele is persuaded to buy a beautiful car for 6 Zaïres. He is then fined 6 Zaïres by a policeman because most of the car's appliances do not function properly.

with art by Martin Ashbury, both well-established British cartoonists known for their science fiction comics. In turn, *Orbit*'s emphasis on space is not random. *Orbit* had been conceived in an era marked by the moon landing (1969), the success of cult phenomenon series *Star Trek* (1966–69) and the release of two major science fiction films which revolutionised mainstream pop culture: *Planet of the Apes* (1968) and *2001: A Space Odyssey* (1968). In fact, the very title 'A Space Safari' is a clear reference to Stanley Kubrick's film. Science fiction's appeal thus provided a convenient hook to attract children's attention and ignite their interest in science.

In this way, not only were comic strips given pride of place in Orbit but, like their counterparts in *Mwana Shaba Junior*, they had a clear role to play, designed as they were to reinforce the specific message outlined by the magazine as a whole. Neither were they devoid of moralising contemplations. Tellingly, Marion and Robert's mini-adventures combine science fiction with agricultural concerns. Marion and Roberts are plant experts who work for the 'Pan-African Survey System'. In their first adventure, which ran over the first four issues of the magazine, they are called to help over mysterious meteor showers which have caused crops to die all across Africa. These showers are identified as missiles or 'sand-bombs' and traced back to one of Mars' moons, to which Robert and Marion duly travel on an international space mission. In their second adventure entitled 'Trojan Horse',[49] a mysterious spaceship shows up in African cities and offers all sort of expensive gifts: cars, tractors, etc. Robert and Marion are sent in a special plane to negotiate with the ship's commander and are informed that offering worthless gifts had been used as a way to test people's spirit 'to see if you understand the supreme law of survival': 'to help one another—to work for the creation of the good life—to scorn the ready-made Baubles of the Gift-horse'. Robert is sent back with a spade and ears of corn which he describes as the 'greatest gift'.[50] In this way, science fiction is harnessed to disseminate the government's agricultural agenda. In addition, accompanying Marion and Robert in every issue were two pages of an adventure story drawn in realistic black-and-white style, stylistically similar to Amalgamated comics. These alternated between the aerial adventures of 'Mike Chanda, Charter Pilot' who works for an air company based in Ndola, the investigative adventures of Inspector Mark Phiri, and the sanitary adventures of 'Jenny Moonga, Health Inspector'. These adventure stories must have given their young Zambian audience a sense of possibilities for what the future might hold: all characters have typical Zambian names and all have 'cool' modern jobs.

Early issues of *Orbit* and *Mwana Shaba Junior* followed the comic canons of the former colonial powers. This is not surprising; not only were the artists who produced the comic strips European, but, as demonstrated above, literature of this type had been circulating on both sides of the Copperbelt for at least a couple of decades. As a result, its graphic and storytelling codes would have already been familiar to at least a part of Katanga and Zambia's population, thus making it easier to re-purpose them for these publications' new aims. Gécamines used Belgian-style one-gag-in-a-page and realistically drawn moralising adventures to reinforce its paternalistic vision. *Orbit*, meanwhile, used UK-type space and adventure stories to reinforce the state's belief in a flourishing industrial future. These early comics, particularly *Orbit*'s, are emblematic of an era when, as James Ferguson put it, 'Africa was "emerging"' and

[49] *Orbit*, 1, 5, 6 and 7, 1971, pp. 1–2.

[50] *Orbit*, 1, 7, pp. 1–2.

'no place was emerging faster or more hopefully than Zambia'.[51] This was a time when, as Wendy Bond recalled, Zambia was 'buzzing with optimism and opportunity':

> It was all very exciting because everyone was determined to make a success of the new nation … and to do it fast! Doors were opening for everyone. … Zambia became international … there were new projects and new cars and new buildings going up and new roads.[52]

Thus, while *Orbit* was not a Copperbelt production, nor was it solely aimed at a Copperbelt audience, it is likely that this is where it was most widely read, along with Lusaka. It is also where it found its most fervent fans, as is suggested by the fact that many of those who later contributed comics to the magazines were Copperbelt natives. Besides, the aim was to inspire the country's youth to aspire to live in a 'Copperbelt-like' society, one characterised by well-organised cities, state-of-the-art infrastructures, an educated labour force and—cherry on the cake—a self-sustained agricultural system.

The script of the Copperbelt's 'emergence' via industrialisation and urbanisation was later confounded by the decades of steep economic decline which followed the fall in copper prices of the mid-1970s.[53] By the early 1990s, *Mwana Shaba Junior* had disappeared and *Orbit* had so severely declined in popularity that it was supplanted, at least on the Copperbelt, by a newcomer youth magazine produced by Mission Press in *Ndola: Speak Out! Yet,* until then, they had become the main vehicles through which the youth of the Copperbelt produced and consumed comics. For one thing, these magazines' longevity and accessibility gave them enormous reach, allowing them to become an 'official space for comics', as Katangese cartoonist Tetshim put it.[54] For another, from the early 1970s, when Congo and Zambia went through a period of 'Africanisation' and 'nationalisation', it was Zambian and Congolese artists who became the sole producers of comic art for the magazines. In fact, for a time, comics became one of the most lucrative activities available to visual artists in Katanga. Cartoonist Kika recalled that in the 1980s, while he and other artists continued to work on painting and metal work, comics were 'what paid best'.[55] Similarly, Kinshasa-born artist Michel Bongo-Liz 'got stuck' in Lubumbashi in the mid-1980s when he was on his way to Southern Africa because 'Gécamines paid good money for the comics which we were producing'.[56] As a result, these magazines provided local artists with the opportunity to 're-appropriate' the medium and say with it what they wanted. Fatefully, they did so in a context of fast economic, political and social change.

Re-Appropriation of the Medium in a Changing Socio-Economic Context

A few years into the 1970s, as the two magazines started using homegrown African talents rather than exported ones, there started to be important shifts in the tone and content of the comic strips published in both *Mwana Shaba Junior* and *Orbit.*Though *Mayele* survived

unscathed because of its popularity with the readers,[57] comic strips published in Junior from 1972 showed an increasing 're-appropriation' of Belgo-French narrative and graphic codes in ways that subverted or reversed them. An early example of this are the adventures of 'Mwana' and 'Shaba', two new characters which first appeared in the *Mwana Shaba Junior* in the summer of 1972.[58] The first two of these, *Echec aux Espions* (1972–74) and *Le Trésor de Targaz* (1975–77), follow a fairly similar template in which its two young journalist heroes travel to exotic locales—New York and 'Tibera', a fictional North African country—and are confronted with gangs of villains, whose plans they thwart.These two stories still have many characteristics that connect them to the Franco-Belgian comic tradition. Both are high-adventure stories set in exotic locations and broadly follow the aesthetics of mid-twentieth-century Belgian comics, being reminiscent of Franquin's *Spirou et Fantasio.* Both are full of slapstick humour—Mwana falls down the stairs of his hotel twice in high comical fashion yet never seems to get physically injured—and present Mwana and Shaba as moral paragons. For example, a new character introduced in *Le trésor de Targaz*, a spoiled princess, who is used to her every whim being catered for, progressively learns to emulate the behaviour of Mwana and Shaba who are selfless and help others without expectation of rewards.Yet, on the whole, the usual template is here reversed. While Mwana and Shaba's country of origin has featured in more than one European comic as the exotic destination, in this case, it is the two heroes who are doing the travelling, visiting such exotic locales as the United States, and they are the ones who are greeted as heroes by the 'natives'. Elements of *Authenticité*-era Zaïre, as Congo was known from 1971, are also visible throughout.[59] Characters refer to each other as 'citoyen' or 'citoyenne', Mwana and Shaba conspicuously use 'Air Zaïre' to fly everywhere, and Zaïre is constantly implicitly being presented as a modern nation, a member of the United Nations on par with any other player on the international chessboard. In this way, European codes of comic-making were here used in a way that updated them for a contemporary 'Zairian' audience.

From around the mid-1970s, *Orbit a*nd its comic strips started to change too, both in outlook and in subjects.These changes were claimed by the editorial team of 1977 to have been inspired by readers' letters,[60] yet this was a period when Zambia too was experiencing important political changes. In 1973, Zambia had become a one-party state, and, as economic decline started to bite, its politics became increasingly centred around the person of the President and the ideologies of the nationalist struggle.[61] This new party line was openly advertised in the *Orbit* of October 1974 which celebrated Zambia's tenth anniversary of independence. For the occasion President Kenneth Kaunda penned a letter for *Orbit*'s young readers in which

[57] Paul Baeke continued the series from Belgium until 1987, when he was replaced by Gécamines employee Mukiny Nkemba.

[58] In total six 'Mwana and Shaba' adventures were published between 1972 and 1989. Cassiau-Haurie suspects that the first two adventures were produced by the Chenge brothers, who ran an influential artistic workshop in Lubumbashi. Cassiau-Haurie, *Histoire de la BD congolaise*, p. 39.

[59] 'Authenticité', or 'Zairianisation', was an official state ideology implemented by the Mobutu regime in the late 1960s and early 1970s. In an effort to rid the country of the lingering vestiges of Western influence, the country was renamed Zaïre, and Zaïriens had to adopt new 'authentic' names, and change their ways of dressing and addressing each other. See Crawford Young and Thomas E. Turner, *The Rise and Decline of the Zairian State* (Madison: University of Wisconsin Press, 1985).

[60] *Orbit*, 6, 6, October 1977, p. 1.

[61] Larmer, *Rethinking African Politics*, p. 167.

he grandly stated that 'we older ones fought and won a battle for political freedom' but this, he continued 'was just the beginning—Not the end!'[62] This was accompanied by a 'special insert', a comic advertised as an 'exciting picture-story' depicting

> how the Zambian people became united by the belief that every man or woman has the right to help decide the kind of life they live … to choose their own government! Orbit tells you how the people of Zambia gave voice to that idea through the leadership of Kenneth Kaunda. And how the people, the idea and the man became one nation on October 24 1964.[63]

Soon thereafter, Marion and Robert were taken down from their pedestal as *Orbit'*s star cartoon to be replaced by Fwanya, a young Zambian schoolboy whose two-pages-long stories were meant to be amusing and to educate children on good behaviour. In 'Fwanya learns that laziness does not pay', for example, Fwanya collects copies of *Orbit* which he is supposed to bring to his teacher so they can be sold. He stops to rest and to read them, allowing the wind to blow all the copies away.[64] Just as Mwana and Shaba had stuck close aesthetically to earlier Belgian and Congolese comics, Fwanya's realistic black-and-white aesthetics are only a stone's throw away from the Fleetway-style comic strips which had previously been the norm in *Orbit.* Similarly, despite this aesthetic continuity, there is a change in content, in this case towards a new brand of moralistic didacticism.

The content of these comics also differed at times from their predecessors in being located in a more distinctly Zambian or Katangese context and making references to events and societal change experienced by Copperbelt society. For example, in January 1975, a new comic in *Junior* entitled *Un espion à Lusaka* featured a young girl foiling a bomb attack at a summit held in Lusaka, where delegations of all 'African copper-producing countries' met to discuss the impact of the fall in copper prices.[65] In fact, from the mid-1970s onwards, *Junior'*s adventure and detective stories took a darker turn and, by the 1980s, stories depicting a character struggling against crime and corruption grew increasingly common. Similarly, comic strips in *Orbit* had become much less 'European-looking' by the late 1970s and, apart from *Fwanya*, all now touched upon topics relating to the realities of contemporary Zambian life. The stories of *Constable Mulenga*, for example, highlighted urban dangers, such as going home alone from the cinema after dark.[66] In a story entitled *Choose a Husband* published in 1977, it was the tricky topic of marriage and the rift between cities and villages that was explored. Tisa, a chief 's daughter, decides to marry 'a successful young man from the city who has come back to the land', who, unfortunately, turns out to be a goat transformed into a man.'You had a lot of handsome young men to choose from', the goat-husband teases Tisa.'You just wanted my money and my car and a goat for a husband Ha! Ha! Ha!'[67] This is consistent with the evolution of the depiction of the village-town relationship in twentieth-century Zambian literature identified by Giacomo Macola. Whereas there had previously been a tendency to assign moral superiority 'either to the urban or to the rural space as a whole', he argued, 'the

[67] Ibid., pp. 22–3.

demise of social expectations of urban permanence led to both spheres of social relationships' and was increasingly 'perceived as fundamentally deficient and unappealing'.[68] Similarly, the story here serves as a cautionary tale for young women who get dazzled by the lures of the city, while it also criticises both city dwellers for their empty promises and villagers for their naivety and longing for material wealth.

Similar changes in perception were expressed in *Junior's Le Masque de la Tortue* (1989–90), in which a young village man named Sadiki travels to the city to help his cousin, only to be disabused by the reality of crime and squalor he finds there. However, instead of going home as the heroes of such stories often do, Sadiki stays, and the message seems to be that people from the village and the city should help each other and are stronger if they do so. City life was further de-idealised with the arrival, in 1987, of a new comic character named Mafuta. As with Mayele, Mafuta's comic strips are one page long, and consist of jokes derived from the frustrations of daily and domestic life. Yet this comic strip differs from Mayele in fundamental ways. Whereas Mayele's jokes are slapstick-based, Mafuta's play on (changing) societal mores and situations that Katangese readers may actually have encountered in real life. Mafuta jokes cover a large number of topics such as gender relationships, superstition, insecurity, and religion, and a great number find humour in family and social obligations. In *L'heureux papa,* for example, two drunk men come to Mafuta's house and demand he offers them a drink since a child was born in his family. They pester him until Mafuta buys them one glass of beer, and when they complain, Mafuta protests,'what are you complaining about? I bought you "a" drink, didn't I?'[69] In *Les visiteurs*, Mafuta receives the visit of his uncle, aunt and children from the village. While his uncle is busy listing all the items he requires from Mafuta (a sewing machine, a bicycle, a suit, a hoe, clothes for his wife and children), Mafuta thinks: 'what a disaster! Now I have five additional mouths to feed … life has become too expensive … I will get rid of them, and quickly.' In order to do so, he gives them a bad supper, leading the unwanted guests to decide to leave of their own accord.[70] Mayele and Mafuta's jokes have in common that they take place in urban settings, mostly in and around the home. Yet, whereas Mayele's jokes show a life of abundance and middle-class aspirations, Mafuta's highlight all that is lacking.

From 1989, the year that the Kamoto mine collapsed, causing Gécamines' total production to drop by 90% between 1989 and 1993, the implicit social and political commentary of *Junior's* comic strips became distinctly more explicit. *Les tribulations de Mashaka*, published between 1990 and 1991, for example, straightforwardly dealt with the effects of poverty. Mashaka is a perennially unemployed character whose wife urges to go out and find work. Yet everything goes wrong for Mashaka. He loses the little money he had earned, breaks his leg yet continues looking for work, finds a job then gets fired, gets evicted from his house, and even tries to commit suicide. He is only saved when a rich uncle comes back from America and offers him a job on no other basis than the fact that he is family. The suggestion is that the only remaining way to get out of one's situation is through a wealthy relative or going abroad. Similarly, *Msumbuko Le syndicaliste, les victimes de la tentation* (1989–90, by Mukiny

[68] Giacomo Macola, 'Imagining Village Life in Zambian Fiction', *Cambridge Anthropology* 25, 1 (2005), pp. 1–10, pp. 6–7.

[70] *Mwana Shaba Junior*, 372, March 1990, p. 5.

Nkemba and Nansong Yav), deals with the effects of economic collapse. In this story, the protagonist is Masumbuko, the chief trade unionist for the textile company, I.T.M., which acts as a stand-in for Gécamines. The company originally does well but the salaries are too low and as one employee comments, 'it's impossible to make ends meet'.[71] As time goes by, an increasing quantity of goods goes missing from the company as employees help themselves to them to compensate for their low salaries. Masumbuko then summons all of his fellow employees and lectures them on having endangered the company's survival and by extension the ability of all workers to feed their families. Another worker then takes the stand and expresses what must have a widely shared opinion among Gécamines' employees: that the directors of the company shared a part of the blame since they had sold out to 'the capitalist system of exploiting Man to extract as much profit out of him as possible' and neglected their 'obligation to think about improving the living conditions of workers'.[72] In that way, I.T.M.'s story is a thinly veiled reference to Gécamines' contemporary struggle with debilitating thefts and underpaid employees.

On the Zambian side, meanwhile, *Orbit* had been largely been supplanted by *Speak Out! A Christian Magazine for Youth*, created by the Franciscan Mission press in 1984. It too contained comic strips, though fewer in number and of a very different kind than those contained in *Orbit*, having been conceived in a very different political context. Whereas there had hitherto been no significant challenge to the party and its government, by the late 1970s and early 1980s, the unprofitability of the mining industry, rising foreign debt and periodic harvest failures finally led to rising discontent.[73] In this context, Zambia's Catholic Church found itself in the position of mouthpiece for the opposition to the one-party state.This it was largely able to do because of its ownership of independent media including magazines such as *Icengelo* (1971–present) and *Speak Out!* (1984–present).[74] Like *Orbit* and *Mwana Shaba Junior, Speak Out!* had games, a questions-and-answers section ('Dear Kabilo'), and competitions. The overall tone however was very different. Whereas *Orbit* was resolutely turned towards a vision of Zambia as a nation at the cutting edge of technology and fully incorporated in a global (or at least Pan-African) world, *Speak Out!* was very Copperbelt-focused, and resolutely turned towards questions of politics and morality. The educational articles on science, technology or history which were *Orbit's* hallmark, were gone. Instead, the bulk of the articles consisted of thinking pieces, fictional and real-life stories often contributed by readers, and scripted conversations in which two friends debated a topic of interest. While political critiques were present in the magazine, with discussions about the education system[75] or the extent of individual responsibility in the quest of employment,[76] these were now approached through the prism of topics that concerned the youth of the Copperbelt. As Danny Chiyesu, who has been producing comics for Mission Press since 1991, explained, *Speak Out!* stood for 'speak-

[76] E.g. *Speak Out!* January–February, p. 2, pp. 3–4.

ing out on all the issues about youth: smoking, sex, marriage, romance, jobs … anything to do with the youth'.[77] It is thus meant to be educational, but in a very different way to *Orbit*. Much in *Speak Out!* was to do with life in the city, changing social mores, and surviving in a world marked by economic hardship. These, accordingly, were the topics which the comic strips published in *Speak Out!* also tackled.

Whereas *Icengelo*, the 'adult' magazine, had a recurring comic character called Katona, whose jokes were written in Bemba and poked fun at daily life in a Zambian urban environment, the 'comic' strips that appeared in *Speak Out!* were not based around jokes. Most were produced by the same person, Ndola resident Michael M. Nkaka, and usually involved two characters, often a man and a woman named Friday and Frida, discussing an issue of political or societal relevance. Some of Friday and Frida's comic strips were more on the straightforwardly moralising side. Nkaka, for example, chose to portray the dangers of drunkenness by having a drunken Friday slip on a banana peel and break his leg.[78] Similarly, exhortations to avoid sex outside of marriage would be accompanied by warnings that it leads to abortion and AIDS.[79] Yet, in most cases, the dialogue format enabled the expression of critical opinions on debates which do not have easy answers, and were sometimes used to air controversial points without appearing to do so. Some comic strips, for example, tackled the question of the legacy of colonialism. In that of March–April 1984, Friday comments to Frida that he does not like going to church as he dislikes the noise of the drums, and considers 'Gregorian chant' to be 'the only suitable music for church'. In this case, it is Frida who was given the last word, arguing that 'it seems you're another one of those old colonials who can't sever their ties with Europe. It's about time you became an African!'[80] By far the most covered topics, however, were those of love, sex and changing gender relations. The May–June 1984 issue, for example, had Friday and Frida entangled in a debate about men and women's role in society in which Friday argued that without a man, a woman is 'a lonely old spinster' while Frida exclaimed that 'you men have ruled us like servants for far too long'.[81]

The village-town relationship is yet another topic which recurs regularly *(see Figure 2.1)*. In the very first issue, Friday complained that he is forced to do manual labour whenever he returns to the village, feeling that, as the best student in his class, he is above such work. Frida responded: 'you should be clever enough to see that manual work will make a man out of you. There are more ways of learning than out of books!'[82] These are but a few examples in a long list of such discussions published in comic form *Speak Out!* in the 1980s. The comic strips themselves had a simple graphic style and were drawn in black and white. Similarly, while Friday and Frida share space in *Speak Out!* with a series of other characters, they are all interchangeable: all serve as vehicles through which to discuss societal questions. In this sense, *Speak Out!*'s strips were an illustration of the extent to which comics, had, by this point, been fully 'weaponised.'

In her 2016 article 'Belgo-Congolese Transnational Comics Esthetics', Véronique Bragard argued that post-independence Congolese *bandes dessinées* displayed what she calls 'a re-fashioning of the genre's form and themes, leading to new engaged postcolonial aesthetics.'[83] She cites the work of Mongo Awai Sisé, one of the first major comic artists who emerged in Congo in the second half of the twentieth century, as establishing the tradition of 'the same but not quite'. By this she means that he borrowed a series of codes and aesthetics from the Belgo-French comic traditions but subverted these codes and aesthetics to tell his own story.[84] Sisé's Bingo series, for example bore some resemblance to *Tintin*, but in a reverse paradigm. In contrast to Tintin, Bingo does not serve as a spokesperson of any civilising mission but instead suffers the consequences of the colonial inheritance, for example when he migrates to the city to find work, only to be confronted with fraud, corruption and general inefficiency (*Bingo en ville*, 1981) or when a trip to Belgium confronts him with the North-South wealth gap (*Bingo en Belgique*, 1982). In that sense, Sisé used some of the codes of the Belgo-French comic traditions to highlight some of the grim realities which Congolese citizens faced.[85] Similarly, the period of nationalisation and Africanisation, coinciding with a fast-changing economic and political environment, marks the beginning of a process of 're-appropriation' of the medium by Copperbelt artists as they sought to distance it from its Western roots. The manner in which this reappropriation took place, along with the themes and stories tackled by the authors, evolved and varied over time, influenced by the intentions of the institutions for whom the comics were produced and also by the socio-political context in which they were produced. The faith in a future that would be urban, prosperous and technologically advanced, and the subsequent gradual deterioration of that faith, have been key features of contemporary Zambian and Katangese literature.[86] It is not surprising therefore that that they should be central to contemporary Zambian and Katangese comics. *Speak Out!*'s comic strips represent the ultimate point at which, in a context of fast-changing societal and economic realities, comics become a means through which to have a conversation about these changes .

Conclusion

Much like other forms of popular culture, comics constitute complex and ambiguous historical material. In recent comics scholarship, they have been increasingly thought of as cultural forms existing in relation to the social/ popular context in which they are produced.[87] On the one hand popular culture has been seen as instrument of social control: it is one of the means through which members of society are instructed in appropriate values, attitudes and behaviour. On the other hand, popular culture responds to the cultural tastes and social values of its consumers and, in this sense, can be seen as a 'mirror' to society. In other words,

comics are both a product of social processes and a medium through which social values are constructed and conveyed, particularly because it is usually aimed at the youth.This tension is visible in the way that comics were produced and consumed on the Copperbelt. Comics were originally an imported form of popular art and, when first embraced by local institutions, it was largely for instrumental reasons, to influence or even manipulate the readers, to inculcate in them carefully chosen values and ideas. At the same time, they had to do so in a way that would 'speak' to its audience. Thus, they not only had to tackle subjects of relevance to Zambian and Katangese society but also had to rely and play on aesthetics already known and appreciated by them. In this sense, the range of comics influences to which the Copperbelt youth was exposed and the extent to which these influences were recycled or updated in comics produced for and by them, is testament to how much of an intercultural crossroads the Copperbelt was, with networks of cultural influences connecting it to several continents. Once Copperbelt cartoonists started publishing, they were able to pick from a wide range of existing codes and themes, and soon adapted them in the way they wished. In the early years, comics in Mwana Shaba Junior mirrored Belgo-French albums both in their graphic and didactic style. Similarly, early comics in Orbit were influenced both by Fleetway comics and the science fiction craze of the late 1960s and 1970s. Yet, as the political horizon shifted, these styles were increasingly subverted and adapted in order to address aspects of the massive societal changes that the communities who read the magazines were experiencing. As a result, though the medium was introduced in a time when there was little doubt that the future would be industrial and prosperous, it became an important avenue through which the effects of the failure of this future to materialise can be observed.

CHAPTER 8

Social Participation in Indonesian Media and Art: Echoes from the Past, Visions for the Future

Edwin Jurriëns

Bijdragen tot de taal-, land-en volkenkunde/Journal of the Humanities and Social Sciences of Southeast Asia 169, no. 1 (2013): 7–36.

Abstract

This article uses a critical and historical perspective to examine some of the achievements of Indonesian community media, the problems they have encountered, as well as the solutions they are offering. It analyses the similarities and differences with earlier genres with an explicit participatory agenda, including certain forms of LEKRA literature and art of the 1950s and 1960s, 'people's theatre' since the 1970s, and 'conscientization art' since the 1980s. One of the main challenges for contemporary community media has been to reconcile class differences in the collaboration between media or art facilitators and local communities. These and other factors have affected the accessibility, distribution, sustainability and reach of their ideas, activities and outputs. The article demonstrates how facilitators and practitioners have tried to solve some of these problems through the exploration of alternative media networks, formats and content.

Introduction

This article focuses on the development of community media in Indonesia. Community media are independent, grassroots-based communication initiatives that are supposed to provide an alternative to the mainstream public and commercial print and broadcast media. These initiatives can be seen as an aspect of the renewed freedom of expression since the fall of President Suharto's New Order regime (1967–1998). They are also a reflection of trends in the international media landscape, particularly the cultures of interactivity and interconnectivity that have been rapidly developing since the introduction of the World Wide Web and mobile technologies in the early 1990s. At the same time, they have their roots in a long tradition of social commitment and participation in a variety of Indonesian cultural genres.

I will use a critical and historical perspective to examine some of the achievements of Indonesian community media, the problems they have encountered, as well as the solutions they are offering. My comparison will not include interactive media that have individual expression and consumption rather than community cohesion or change as their main purpose, such as the bulk of 'social media' using internet and mobile phone applications. It will also exclude traditional art genres that have their own modes of social participation and community building, but not the activist agenda of community media. [1]

First, I will analyse the similarities and differences with earlier genres with an explicit participatory agenda, including certain forms of LEKRA literature and art of the 1950s and 1960s, 'people's theatre' (*teater rakyat*) since the 1970s, and 'conscientization art' (*seni rupa penyadaran*) since the 1980s. Then I will focus on the various initiatives of media activists in the village of Timbulharjo, Central Java, as a specific example of contemporary community media. Not only have these activists been at the forefront of the development of community media in Indonesia since the early 2000s, they have also covered a variety of media, ranging from print bulletins to radio and internet. Their experiences illustrate both the potential and the limits of community media in Indonesia, and resonate with some of the characteristics of the historical participatory genres.

One of the main challenges for contemporary community media has been to reconcile class differences in the collaboration between media or art facilitators and local communities. These and other factors have affected the accessibility, distribution, sustainability and reach of their ideas, activities and outputs. The final part of this article will demonstrate how facilitators and practitioners have tried to solve some of these problems through the exploration of alternative media networks, formats and content.

Community Media

In Indonesia, community media or media komunitas have been described as media 'from, by and for the people.' According to this definition, com¬munity media are a type of participatory media in which 'ordinary' people, that is, non-media professionals, can contribute to content, management and ownership. Following Raymond Williams (1980), Atton (2002:4, 25) describes community media as a form of alternative media, comprising various degrees

[1] An example of the first is people's personal Facebook pages; an example of the latter the Javanese social dance genre *tayuban* (Hefner 1987).

of the 'decapitalization', 'deprofessionalization' and 'deinstitutionalization' of communication. Alternative media would facilitate a more democratic form of communication, as they give access to media production, distribution and consumption to people who are excluded by the financial, professional and institutional structures of the mainstream media.[2] They are not limited to media with an explicit or radical political agenda, but include any media that enable people to reflect on and transform processes of communication in relation to their specific social circumstances.[3]

Community media have their international roots in groups using pamphlets, radio, audio and videocassettes as well as other media for a specific cause. For instance, community radio has been used for demanding better working conditions for Bolivian and Columbian miners in the late 1940s; for fighting government broadcasting monopolies in Europe in the 1960s and 1970s; and for promoting democracy in South Africa after the fall of the Apartheid regime in the early 1990s *(Fraser and Estrada 2001:6)*. Nowadays community media in Indonesia and elsewhere are seen and used as a tool in the struggle against the intensified commercialization, monopolization, and homogenization of the mainstream print and broadcast media.

Since 1998, Indonesia has experienced a spectacular growth in commercial print and broadcast media. While audiences have easier access to a larger quantity of media, they are not necessarily exposed to forms of information, entertainment, and artistic expression of greater variety or higher quality, however. Instead of a true decentralization of media ownership and content, in line with the post-New Order ideal of regional autonomy *(otonomi daerah)*, national players have simply usurped regional media businesses, while successful regional players have expanded their businesses to regions elsewhere in the archipelago *(Ida 2011:14–8)*. The public, formerly state-owned radio and television stations Radio of the Republic of Indonesia *(Radio Republik Indonesia, RRI)* and Television of the Republic of Indonesia *(Televisi Republik Indonesia, TVRI)*, are still in a struggle of redefinition or self-discovery, and have not provided a valid alternative to and on behalf of the general public or specific groups and communities in society. It is in the context of this lack of audience participation and representation in the Indonesian commercial and public media that community media have grown and developed.

Ideas about the history and concept of community media spread to Indonesia through the educational and practical training programmes of international organizations such as UNESCO.[4] Initially only involving a dozen of pioneering print bulletins and radio stations in predominantly Central and West Java, nowadays hundreds of community radios can be found throughout Indonesia. Since the early 2000s, Indonesian community media initiatives have also incorporated other technologies, such as video, television, and internet. The 2002 Indonesian Broadcasting Law (Undang Undang Republik Indonesia Nomor 32 Tahun 2002 tentang Penyiaran, particularly part 6, paragraphs 21 to 24) includes community media as a fourth official broadcasting category, besides public, commercial and subscription broadcasting services.

[3] Atton 2002:7, 30; Howley 2010b:17–9; Dowmunt 2007:3–4.

[4] In September 2001, UNESCO organized an influential seminar on community radio in Jakarta and Yogyakarta and distributed a handbook on community radio (Fraser and Estrada 2001) in Indonesian and English to radio practitioners nationwide.

In terms of technology and approach, community media reflect some of the main cultural trends and phenomena of our time. Exploiting the communicative possibilities of a single medium, or convergences between multiple media such as radio, television, video, mobile phone, and internet, they promote social interactivity, connectivity, conviviality, and DIY culture on, and sometimes also beyond, the local level. As mentioned, Indonesian community media also build on creative genres in post Independence Indonesia with a political agenda of social commitment and participation, such as forms of LEKRA literature, people's theatre, and conscientization art.

Social Engagement in Art: The Institute of People's Culture 1950–1965

No other institution in Indonesian history has put the issue of social commitment in culture and art higher on the agenda than The Institute of People's Culture (Lembaga Kebudayaan Rakyat, LEKRA). LEKRA, which existed from 1950 until 1965, was informally linked to the Indonesian Communist Party (Partai Komunis Indonesia, PKI), and encouraged artists to demonstrate social commitment in their works and activities. LEKRA also introduced participatory genres and methods, although in its literature and other art there was a stronger tendency to represent local people rather than engage and work with them directly.

In that sense, contemporary community media are less ambiguous: social engagement is not only something to be represented, but also something to be demonstrated or performed through the actual participation of local communities. The relation between the intentions and interests of local communities on the one hand, and the creation and distribution of art and media works on the other, is usually mediated by third parties with their own approaches and agendas, and therefore not unproblematic. The concept of community media itself, however, encourages coherence between content (social issues) and format or style (social participation).

Keith Foulcher *(1986)* has observed a lack of such coherence in LEKRA literature and other art. Reflecting President Sukarno's discourse *(1949–1965)* on the Indonesian postcolonial state and its position in the world, LEKRA promoted a combination of nationalism, anti-imperialism and modernization that was rooted in the reality and ambitions of the *rakyat ('society' or 'the people')* (*Foulcher 1986:28*), a term also commonly used in the context of contemporary community media. Initially, in LEKRA's Mukadimah *('Preamble')* founding statement of 1950, 'the people' referred to class and material interests, but in the mid-1950s the idea was formulated by the institute in terms of an emotional commitment to values *(nationalism, anti-imperialism, modernization, justice, equality)* that went beyond class divisions (*Foulcher 1986:29*). Artists were supposed to share this 'state of awareness' or 'state of mind' and reflect it in their creative works. Foulcher *(1986:25)* argues that this type of social commitment was restricted pre dominantly to the 'content' of art, but never really translated into a distinct aesthetic theory, style or production method:

> In its development [...], it is the pursuit of appropriate 'states of mind', which marks LEKRA's aesthetic philosophy. Its evaluative criteria were never stylistic or methodological, and it never in practice questioned the material basis of cultural production in Indonesia. This meant that LEKRA engaged with, rather than negated the bourgeois nationalist tradition, adopting some of its products and some of the tendencies within it, even as it condemned others.

LEKRA promoted an idea of socialist realism that was based on the work of the Russian author Maxim Gorki (1868–1936). This socialist realism was a form of realism in its attempt to represent the nature, essence or truth of society and everyday life; it was socialist in presenting an idealist, revolutionary vision of the future with suggestions, changes and solutions for a better Indonesia (Foulcher 1986:23, 37–9, 50, 121, 141). Usually, there was no explicit concern with the construction of a political form of socialism, however, but rather a 'revolutionary realist' focus on 'immediate, concrete issues,' and 'the struggle for justice in a radical nationalist context' (Bodden 2011:463–4).

In terms of style, the socialist or revolutionary realism of LEKRA-related artists shared many characteristics with the modern, if not modernist, outlook of the rival 'universal humanist' camp.[5] The creation and evaluation of LEKRA art was generally based on the same criteria of originality and individuality, although in terms of content and attitude towards reality the work rejected the ahistorical and asocial general values of the universal humanist artists. According to Foulcher (1986:41–51, 122–3, 134–7), the paradoxical and theoretically problematic character of combinations of modem western styles, such as realism and expressionism, and people oriented *(kerakyatan)* content remained largely ignored or unsolved by the LEKRA artists and art critics.[6] Although the integration between message and approach or presentation is at the heart of contemporary community media theory, in practice incongruities remain, as in the Timbulharjo alternative media initiatives discussed later in this article.

This is not to say that LEKRA did not promote innovative artistic methods or formats, distinct from the universal humanist tradition and partly continued in today's community media. For instance, LEKRA provided material, organizational and promotional support to painters and other visual artists that were part of so-called *sanggar (Holt 1967:218; Foulcher 1986: 41–2)*. In *sanggar*, which originated from the time of the Revolution *(1945–1949)*, a senior artist taught painting and other creative skills to young aspiring artists. The artists normally worked as a cooperative and lived as a commune in an *asrama*.[7] They also organized art exhibitions and work shops in the open air that were accessible to the general public *(Spanjaard 1998:120; Foulcher 1986:140)*. Examples of these communities were the Pelukis Rakyat *('People's Painters')*, who used the slogan 'Art for the people' *(Seni untuk rakyat)*, and the Seniman Indonesia Muda *('Young Indonesian Artists')* of the 1940s and 1950s.

LEKRA also published reportage-style short stories by ordinary people who normally would not present themselves as literary authors in the cultural affairs section of the PKI daily Harian Rakyat *('The People's Daily')*. In terms of content, these stories can be seen as

[5] An important statement explaining the Indonesian notion of universal humanism, without using the actual term, is the Surat Kepercayaan Gelanggang (Letter of Gelang gang Beliefs) of October 1950. This statement, issued by the nationalist, non-Communist art collective Gelanggang ('Arena'), expressed the belief that the development of a modem national culture and literature in Indonesia would not be fundamentally different from that in Europe or other parts of the world (Foulcher 1986:2–3).

[6] Michael Bodden (2012:455) has nuanced Foulcher's observation by pointing out that in various theatre and dance genres of the time 'potentially radical aesthetic ideas […] were being formulated and developed through practice on a variety of local "stages"'. These included mobile theatre and dance groups and so-called *sendratari* dance drama spectacles that were meant to be more accessible to the ordinary people than classical performing art genres. Nevertheless, even in these cases, direct and relatively spontaneous audience participation in performances was limited, and often only allowed after a rigorous review process guided by the PKI cadres (Bodden 2012:468–9).

[7] A large main house with smaller nearby structures (Holt 1967:218; Wright 1994:21; Harsono 2009e:101; Harsono 2009b:129–31).

early examples of media 'from and for the people,' although the newspaper itself was not managed or owned 'by the people,' as would be the case in more recent community media. The stories were not published in their original regional languages, but translated into the national language. Most likely, they were also extensively edited and rewritten in other ways. According to Foulcher (1986:54), this genre remained 'a minor tendency overshadowed by the direction of the movement as a whole, and its "proletarian" character is still mitigated by the fundamental "modernizing" and "national culture" elements of LEKRA ideology.'

In the early 1960s, when LEKRA became more directly involved in party and state politics, it demanded a stronger social commitment of artists and cultural activists by encouraging them to 'move down' (*turun ke bawah* or *turba*) and live, work and otherwise fully participate in local communities (Foulcher 1986:107, 110). On the one hand, the usually urban-based artists and activists were to undergo a personal transformation as a result of the physical deprivations and psychological hardships of living in the countryside; on the other hand, they were also prompted to conduct research about and examine the revolutionary potential of regional art forms and culture (Shackford-Bradley 2000). [8]

Shackford-Bradley (2000) argues that 'the very concept of "descent from above" is based on a spatial configuration of class that is uncompromisingly hierarchical.' Ironically, the term itself continued to be used by state officials during the New Order to refer to their official visits to the Indonesian slums, villages, and outer regions (Shackford-Bradley 2000). The aspect of class division would not be solved by the people's theatre and conscientization art of the following decades, and it still poses a real challenge to today's community media facilitators. In general, community media facilitators have a higher education than their target groups, and the length and depth of their immersion in local societies is relatively limited.

Early Participatory Media: People's Theatre since the 1970s

After Suharto took over power from Sukarno in 1965, LEKRA and PKI were banned, and hundreds of thousands of their real or alleged members were imprisoned or killed in a series of violent events that took place in Java and other islands. The universal humanist approach of individual expression and international and decorative styles became the officially approved creative practice, while socially and politically engaged art and media were discredited, censored, or banned. This does not mean, however, that artists and media practitioners did not attempt to express socio-political commitment in various other, often innovative ways.

The New Art Movement (Gerakan Seni Rupa Baru, GSRB), for instance, deliberately distanced themselves from academic, politically accepted, or universal styles, such as abstract modernism, post-impressionism, and classical realism. They were influenced by the 1960s Pop Art movement in the United Kingdom and the United States, the West German sculptor Joseph Beuys (1921–1986) (Hardi 1979:14–5), and early twentieth century Dadaism and

[8] The concept of *turba* was influenced by Maoist thought, particularly the idea of xia fang ('to go out into the countryside'), and marked LEKRA's growing orientation towards Chinese communism since the late 1950s (Shackford-Bradley 2000). This new orientation also influenced the introduction of the slogan *Politik adalah Panglima*, or 'Politics is the Commander', which not only urged artists to retain their socio-political commitment, but also implied that LEKRA would become increasingly involved in state politics as a means to further develop Indonesian art and culture. Only from 1964 to 1965, a stronger, direct impact of PKI on LEKRA became manifest (Foulcher 1986:107–8).

surrealism, and adopted and reinvented genres such as performance art, happenings, installations, mixed media, found objects, and photorealism.[9] They engaged with the daily realities of contemporary consumer culture, and sought to level 'the aesthetic distance between the art of urban mass culture—such as *becak* decoration, folk arts, or *seni rupa di kaki Lima* ("street" art, comprising such expressions as posters, T-shirts, bumper stickers, comics and the many other articles commonly found for sale in urban street stalls and shops)—and contemporary art as practiced by graduates of art academies' (Miklouho-Maklai 1991:1).

According to FX Harsono (2009e), co-founder of GSRB and prolific artist and essayist, the movement had a different, broader idea of people's issues *(kerakyatan)* than the previous generations of socially engaged artists. In their works and statements, the young artists, children of both the New Order regime and the era of globalization, gave expression to issues of national and international concern, such as 'the environment, displacement, labour, humanity, war, the culture of violence and the conflict between traditional and modern culture' (Harsono 2009e:106). Brita Miklouho-Maklai (1991:26) observed that GSRB attached equal importance to form and content for expressing their ideas, whereas earlier movement such as LEKRA focussed on content rather than form. However, similar to the majority of LEKRA literature and visual art, GSRB was about representing social commitment rather than enabling direct social participation. The decision of artist activist Moelyono (1997:124) to create the 'conscientization art' that will be discussed later in this article was also partly in protest against the fact that GSRB seemed to speak on behalf of the 'ordinary people' rather than engage in real dialogue with them.

The principles and sources of social engagement of another art form during the early New Order regime, people's theatre, were much closer to those of the community media of the late twentieth and early twenty first century. An institution that best illustrates the connections between people's theatre and modern community media is the Yogyakarta-based catholic media production centre PUSKAT Audiovisual Studio. PUSKAT has contributed to the development of lndonesian people's theatre through its involvement with the Arena theatre group since 1971 (Hatley 2008:134–7; Bodden 2010:58). In the 1980s and 1990s, it gradually expanded its activities to other art, media and topics, including religion, youth, regional culture, agriculture, and ecotourism. In 1995, it established its own community radio station Balai Budaya Minomartani (Jurriëns 2009:153–4), which focuses on children's programmes and Javanese arts including wayang kulit and *gamelan*, and is based on principles similar to those of people's theatre, such as accessibility, participation, and 'conscientization' or creating social awareness through education.[10]

Arena's version of people's theatre was influenced by various international sources, particularly the work of the Brazilian educator and philosopher Paolo Freire, the Brazilian theatre director Augusto Boal, the Philippine Educational Theater Association (PETA), the German playwright Bertold Brecht and the Canadian theatre activist Ross Kidd (Erven 1992:187; Bodden 2010:59–62, 68). Aspects of these sources, especially Freire's idea of conscientization, are reflected in the people's theatre theory as formulated by Fred Wibowo (Bodden 2010:80–1),

[9] Miklouho-Maklai 1991:2, 25; Harsono 2009a:50; Harsono 2009c:69; Supangkat 1979:99–103.

[10] This idea of conscientization has been developed in Paolo Freire's *Pedagogy of the oppressed* (1970). This book also inspired Augusto Boal's version of community theatre, called the 'Theater of the Oppressed' (1979).

who was the artistic leader of Arena from the early 1970s to the early 1990s, and later became the managing director of PUSKAT. This theory comprises the following six points:

1. The stories of performances must have their origins in local social conditions;
2. The scripts of performances should be created and arranged by the local people themselves;
3. Performances should be kept simple, and make use of easily accessible, locally available resources;
4. They should break down the barriers between performers and audiences, and avoid the use of professional actors;
5. They should not aim at catharsis, but at raising awareness about social problems;
6. They have to effect change and create conditions for a better world by building dialogue between people.

If these six criteria are followed, people's theatre can become, in Wibowo's words, a true 'people's feast' *(pesta rakyat)* and a 'rehearsal' for complete social change, including material improvement (Bodden 2010:80–1). PUSKAT has based its community radio station and community media training workshops on similar ideas. The members of another Yogyakarta-based group, the Indonesian People's Theatre Group (Kelompok Teater Rakyat Indonesia, KTRI, established in 1989), took the idea of people's theatre to a more radical end than Arena, by living and working full-time, in *turba*-like fashion, with local communities (Hatley 2008:136; Bodden 2010:74–6).

Community media facilitators such as PUSKAT have not only worked with local groups, but also trained NGOs to combine their development programmes with theatrical and other cultural techniques for informal education and social conscientization (Bodden 2010:74). It is in this complex interaction between cultural workers, NGO activists and local communities in people's theatre and other cultural activities at the grassroots where conflicts of class and other interests have arisen. One issue that emerged in various forms of 'workers' theatre' *(teater buruh)* in the 1990s, for instance, was that collaborating (well-educated, middle-class) NGO activists valourized theatre groups more in terms of their contribution to a labour movement than in terms of their own artistic development. For the workers themselves, on the other hand, theatre was not only a medium for representing everyday life reality, providing education and building solidarity, but also for enjoying the pleasures of association, recreation, and relaxation (Bodden 2010:227–9). Middle-class artists, art critics, and journalists, for their part, often ignored or criticized the artistic value of workers' and other grassroots theatre. The performances were primarily seen as tools for creating awareness, not for providing aesthetic sophistication or innovation (Bodden 2010:239–42, 256–8).

This type of criticism echoed the conflict between style and content in the creation and discussion of LEKRA art during the 1950s and 1960s. I argue, however, that rather than suffering from a lack of artistic quality, grassroots theatre and, in its following, other community media present a specific, new type of aesthetics. This aesthetics, in line with the con tent and production mechanism of grassroots performances, has a strong contextual, interactive, and dialogical character. It constitutes an important alternative to the universal humanist aesthetics of time- and space-transcending originality and individuality, which became the

dominant and politically endorsed line after the abolition of LEKRA in 1965. According to Michael Bodden (2010:241), 'rather than searching for universal values, workers' theatre embraced the local, specific issues of its primary audience and did so in a way that allowed the audience to join in the fun. This 'intimacy' was then joined with modem notions of theatre as an educational medium.' In the current age of computer-mediated interactivity and connectivity, aspects of this alternative aesthetics have moved more to the centre of creative production and consumption, although, both in Indonesia and elsewhere, community media as a whole are still battling to find social and political acceptance.

Creating Awareness: Conscientization Art since the 1980s

Indonesian artists have applied Freire's idea of conscientization not only to theatre, but also to drawing, installation, and other visual art. The Indonesian pioneer of such participatory visual art is Moelyono. Accord ing to Moelyono (1997a; 1997b), art, as a means of education, expression, and dialogue, can make people critically aware of their position and role in society, and encourage them to voice their aspirations and alter their prospects for the future. He has used various names for his art, which all refer to social participation, social awareness, and social change, including 'conscientization art' (*seni rupa penyadaran*), 'renewal art' (*seni rupa pembaruan*), 'virtuous art' (*seni rupa kagunan*),[11] 'public art' (*seni rupa publik*), 'community art' (*seni rupa komunitas*), 'art at the margins' (*seni pinggiran*) and 'Village Unit Art' (*Kesenian Unit Desa*).[12]

Since the mid-198os, Moelyono has promoted his thoughts about art and education through his work as an art teacher in East Java. For years, he has been rotating between a Catholic high school in the town of Tulunga gung, a teachers' training college in the town of Kediri, an art institute in Surabaya, and a small elementary school serving the tiny fishing villages of Brumbun and Nggerangan in the Tulungagung regency (Wright 1994:216). Since 1993, Moelyono has also run his own art foundation in the town of Tulungagung, called Foundation of Community Art (Yayasan Seni Rupa Komunitas). The foundation provides art education, documentation, work shops, discussions, and children's art festivals and exhibitions (Brangwetan 2011). Moelyono (2005:5) has brought his art programmes also to provinces outside Java, including Aceh and Papua.

Moelyono has used his art classes as a means to improve and create awareness about the material, mental, and physical wellbeing of his students (Wright 1994:214–6; Harsono 2009d:57–62). While drawing is his preferred medium, he also uses other, three-dimensional media such as rattan sculptures as interactive tools for play and instruction (Aditjondro

[11] *Kagunan* here means 'a skill, a technique, and a practice that can be controlled and practiced by all people' (Moelyono 1997a:128–9). In Old Javanese, *guna*, the base word of *kagunan*, has the connotations of 'goodness, good characteristics, character, virtue, ability, skill, expertise, capability, holiness, use, benefit, service, charity, power' (Moelyono 1997a:124). For Moelyono (1997a:129), these characteristics confirm that art is not restricted to the practices and judgments of an educated and/or wealthy elite, but forms 'an inalien able aspect of everyday life' and implies deeply rooted (Javanese) communitarian values.

[12] Kesenian Unit Desa is play on Koperasi Unit Desa, or Village Unit Cooperation, a New Order government economic initiative to improve the living standard of farmers (Moelyono 1997a:93). One of the purposes of Moelyono's Village Unit Art was to provide a platform for protecting and reviving local art traditions, such as traditional horse dance (*jaranan or kuda lumping*) and glass painting (*lukisan kaca*) in East Java (Moelyono 1997a:92–106).

2005:87). He tries to provide education and social change 'from below' by asking children and their parents direct or indirect questions about everyday matters, such as the problem of clean drinking water.[13] By encouraging them to give expression to these issues in art, he hopes that his students can break away from habitual ways of observing and behaving, and produce imaginative ideas and practical solutions (Wright 1994:217–8).

In August 1988, Moelyono organized an exhibition in Jakarta with drawings from the East Javanese fishing village children, which, in line with his idea of *seni rupa penyadaran*, was titled 'Transformative Dialogue'. The exhibition catalogue was not a normal art catalogue, but also included texts, maps, statistics, and photographs that presented a geographical and social portrait of the villages and their residents (Wright 1994:216–7). The money from the art works sold at the exhibition was used to fund local projects such as water storage facilities (Harsono 2009d:61). Moelyono (1997b:86–91) has done projects not only with rural communities, but also urban groups. On 12 August 1993, for instance, he used installation art as a medium to mobilize a group of factory workers in Surabaya for an event at the Surabaya Art Council, called 'An Art Exhibition for Marsinah'. This controversial exhibition, which commemorated the first 100 days since the rape and murder of local worker-activist Marsinah, was closed by the police soon after its opening (Moelyono 1997b:98; Fakih 1997:xxix).

It may be difficult to find the same degree of social commitment as shown by Moelyono among other community media facilitators. Even his supporters do not unconditionally accept every aspect of his approach, however. In an essay for one of Moelyono's books *(2005)*, the well-known Indonesian sociologist George Junus Aditjondro pressured Moelyono along with community media facilitators, local residents, and academics in general to re-evaluate their own position in various forms of social interaction. Aditjondro's critical questions included the following: first, how can the oversimplification and confusion of categories such as 'poor people,' 'people with problems,' 'villagers,' and 'children' be avoided?; second, considering the variety of problems faced by local residents, who decides on the selection of key themes for public display and discussion with the outside world?; and third, what are the target audiences for exhibitions that take place outside the local communities, and what is their connection with the communities and/or community media facilitators? (Aditjondro 2005:85–104).

Aditjondro (2005:84–5) wondered, for instance, why Moelyono (1997b:79–82), for an exhibition touring Java in 1989, highlighted the theme of the diversion of village land and resources for tourism purposes in Nggerangan and Brumbun, while many other issues could have been raised from the art works produced by the local villagers. Referring to the sale of artworks at the 1998 'Transformative Dialogue' exhibition, he also warned for the risk of diverting projects from their original pedagogical and emancipatory purposes to merely becoming fund raising events. Similar to the lessons drawn from the *teater buruh* initiatives, and equally relevant to various forms of contemporary community media, this suggests that the interests of an outside party, no matter the sincerity of its social commitment, do not necessarily match those of the target communities. Aditjondro (2005:92–4) also referred to

[13] Moelyono (1997a:95–6) decided to work predominantly with children, not only for pedagogical reasons, but also out of pragmatic and safety considerations. While living in the Nggerangan and Brumbun villages, he was constantly interrogated by the local bureaucracy and security forces about his background and motives for working with isolated and poor communities. One of the returning, intimidating questions was about his familiarity with the Indonesian political events of 1965. This was a warning for Moelyono to avoid any suggestions that he was trying to revive communist ideology and the ideas and practices of LEKRA.

the more basic problem of community art and media activists needing to decide on the right moment to leave their target group and consider their mission of supporting independence and emancipation accomplished.

Contemporary Community Media: The Case of Timbulharjo

A more recent example of similar issues is the range of local media initiatives in the Central Javanese village of Timbulharjo. In 2000, youth from the Dadapan area in Timbulharjo made use of the relaxed media regulations of the reform era to start a print bulletin, called *Angkringan.*[14] The village youth believed the bulletin would be an effective means to, firstly, assist people in communicating their thoughts and organizing and monitoring themselves; secondly, strengthen the role of local people in control ling corruption in their village administration; thirdly, give specific interest groups a stronger bargaining position in negotiations with other groups; and, fourthly, unite the various village factions (Sulistyowati, Wuryantono and Astuti 2005:171–2).

The *Angkringan* bulletin is published four times a month and costs only Rp. 750 (approximately A$ 0,08) per copy. Apart from the income from sales, the production costs are covered with the money from advertisements of local small trade. In addition to local news, the bulletin publishes national news of local relevance, for instance about an outbreak of a virus. The first edition of th\e bulletin, published on 14 January 2000, critically discussed the way in which the village government had handled money for a poverty reduction project. Partly as a result of the publication of stories about the mismanagement of the poverty reduction funds, the village head was forced to step down.

In July 2000, the *Angkringan* bulletin was the only community medium to receive one of the annual media awards of the Jakarta-based NGO Institute for the Studies on Free Flow of Information (Institut Studi Arus Informasi, ISAI). The prize money of Rp. 2,500,000 (approximately A$ 450) was invested in the establishment of a community radio station, also called Angkringan. The station started broadcasting in August 2000 (Sulistyowati, Wuryantono and Astuti 2005:171–3; Jurriëns 2009a:147–9). Its advantage over the print bulletin is that it has a larger reach and can also be understood by illiterate people. As the villagers are usually busy with their normal work and other activities during the day, the broadcasts take place every night from 8 to 11 pm. The broadcasts discuss issues such as land certificates, social insurances, and public housing (Sulistyowati, Wuryantono and Astuti 2005:174).

Since 2007, the Timbulharjo citizens have also used the community radio infrastructure to broadcast internet signals. The advantage of this system is that users do not have to pay individual internet connection fees, but can share the costs with each other, which amount only to several thousand Rupiah (less than A$ 1) per household per month. To receive the internet signals, the Timbulharjo citizens use so-called 'wajanbolic', or modified *wajan* or frying pans, which are not only cheap but also have symbolic value as basic cookware that can be found in almost every Indonesian household and *warung* (food stall). The wireless internet service, called AngkringaNet, provides the local people with internet links to the outside world as well as an intranet exclusively for the community. The AngkringaNet website contains vari-

[14] *Angkringan* is Javanese for a small outdoor food stall where people come together to eat and chat. Typically, it consists of a bamboo carrying pole with a basket or chest for storing and presenting food on either end.

ous Open Source software programmes for general use, and also enables people to access and contribute to a Village Database with information about local governance, economy, health and other issues. Community members are also trying to use the internet service for the local production, broadcasting and reception of television programmes (Jurriëns 2009b).

The various Angkringan community media receive operational support from the Yogyakarta-based NGO Combine Resource Institution (CRI), which itself receives financial support from The Ford Foundation. As The Ford Foundation requires that every partner organization of CRI has legal status, the Timbulharjo community established the Timbulharjo Citizens' Communication Forum (Forum Komunikasi Warga Timbulharjo, Fokowati), an official body for the coordination of the local media initiatives, on 27 May 2001. Fokowati aims to contribute to a 'participatory, transparent and accountable governance of the Timbulharjo village', and tries to maintain its independence by not accepting any members of the village government (Sulistyowati, Wuryantono and Astuti 2005:174–5).

The Angkringan community media discuss issues that were raised during workshops organized by Fokowati and involving representatives of all the major interest groups in the village, including women and youth. The five key problems highlighted during the workshops were the mismanagement of land certificates, students leaving high school prematurely, unemployment, the lack of financial support for local businesses, and inadequacies in the village's material infrastructure. With support from CRI, Fokowati was relatively successful in bringing these issues to the attention of the village government. Initially the Angkringan community radio station was even provided with a space at the village meeting hall. After a while, however, their phone connection began to be interrupted by members of the village government who disagreed with some of the broadcast content, in particular about the government's mismanagement of land certificates (Sulistyo wati, Wuryantono and Astuti 2005:196).

According to a detailed study of the Communications Studies programme at the Tertiary Institution for Village Community Development (Sekolah Tinggi Pembangunan Masyarakat Desa, STPMD 'APMD') in Yogyakarta, the availability of community media and other public institutions in Timbulharjo has not sufficiently improved people's political participation in terms of 'voice,' 'access,' and 'control' (Sulistyowati, Wuryantono and Astuti 2005:183). 'Voice' here means to be able to express one's opinion about issues related to governance and development; 'access' to be able to influence and participate in the creation of government policies and public services; and 'control' to be able to monitor the operations, policies and financial situation of the government (Sulistyowati, Wuryantono, and Astuti 2005:168–9). Although community media can serve a broader spectrum of more subtle types of politics—the politics of local identity, gender, or the media, for instance—the focus on administrative politics is useful for testing the reach, depth and strength of the ideal of social empowerment through community media.

According to the STPDM 'APMD' report, one of the problems directly impacting the Angkringan community media has been Fokowati's lack of initiatives after the partnership with CRI formally expired. The only people willing to participate in the activities are the local educated elite. The majority of the Timbulharjo population does not understand the idea and function of Fokowati, due to a perceived lack of media literacy, or an antagonism towards a communication forum that was introduced by an external organization. While the total population of Timbulharjo counts more than 16,000 people, the discussion forums are

attended by an average of only 20 to 40 villagers. Because of technical and financial problems, there have also been interruptions in the publication of the *Angkringan* bulletin (Sulistyowati, Wuryantono, and Astuti 2005:196–200).

On the basis of the Timbulharjo experience, the STPMD 'APMD' research team published three recommendations to improve the effectiveness of community media. Firstly, local citizens should be made aware of the presence, function, and benefit of community media, and be given a sense of ownership of these media. Secondly, community media should be supported by 'transformative' leadership that is able to formulate and put into operation democratic policies. Thirdly, education should be provided to help people transform themselves, and become the subjects rather than the objects of communication practices, and consequently also the initiators rather than the targets of local policies (Sulistyowati, Wuryantono, and Astuti 2005:201). In short, some of the main issues have been accessibility and participation, political support and reach, and media education. Indonesian community media facilitators and practitioners are aware of these and other difficulties in their work, and are in a continuous process of self reflection and improvement.

Media Distribution and Institution Building

One clear theme to draw from these contexts is that collaboration between art or media activists and local communities typically involves a complex negotiation of conflicting interests and class differences. The success of these negotiations depends on the transparency of the arrangements and the depth and length of dialogue between the various participants. The failure of some (aspects of) of these negotiations puts the idea of media 'from, by and for the people' in critical perspective. At the same time, however, community media initiatives should be credited with publishing stories and creative ideas to the outside world that would normally not reach the mainstream media.

For the participants in community media initiatives, the distribution of media content is usually a bigger challenge than the production of such content. Indonesian community video facilitators and practitioners, for instance, do not have access to the mainstream channels for the distribution of films and DVDs. In commercial cinemas, there is a lack of digital projection facilities that allow the screening of film as well as video (Videochronic 2009:39). Commercial DVD outlets such as Disc Tarra only distribute videos that meet the required minimum number of copies (usually 1,000 copies or more) and carry a tax ribbon issued by the Film Censorship Board (Videochronic 2009:41). A problem for video artists is that they may not be invited to exhibitions and festivals if their work is already available on the World Wide Web. The organizers of video festivals themselves are often confronted with complex organizational problems and copyright and censorship issues (Videochronic 2009:39).

Many video activists also refuse to have their work broadcast on public or commercial television, because they feel this would compromise the independent or radical character of their activities. Those who do not object to working with mainstream television institutions often miss out on receiving royalties, because their work is regarded as non-profit in nature (Videochronic 2009:40). Community television is still in its early phase of development in Indonesia (Nazarrudin and Hermanto 2009), and video activists and community television practitioners are often not aware of the complementary values of their activities and ideas.

Faced with these challenges, Indonesian alternative video practitioners have come up with many creative solutions to make their work accessible to the public. These solutions include screenings at alternative venues, such as independent cinemas, foreign cultural institutions, art galleries, campuses, political centres, village halls, boarding schools and family homes. Films and videos are also shown outdoors, continuing an Indonesian cinema tradition of projecting movies on mobile, temporary screens or *layar tancap* (literally, 'screens that are stuck into the ground') (Videochronic 2009:38). Another form of distribution is the sale of DVDs or VCDs in alternative bookshops, on promotional internet sites or in so-called distro or small 'distribution' shops for independently produced fashion, music, video, and other creative work (lskandar 2006:106–7; Uttu 2006).

Support for the distribution of alternative video is also provided by the Australia and Indonesia-based NGO EngageMedia. EngageMedia attempts to build an on-line network of video activism in the Asia-Pacific region, so facilitators and practitioners can easily get in touch with each other for exchanging materials and ideas. One of the NGO's initiatives has been an open source video-sharing platform called Plumi. The system makes it possible for local organizations to set up video archives 'which run on a server hosted locally in the office of the organization, making uploading and downloading to the archive extremely rapid. Videos can be watched by anyone on the local area network and easily copied to USB sticks, DVDs and CDs' (Videochronic 2009:49). EngageMedia expects from the organizations that make use of its facilities to publish their work under Creative Commons (CC), which is an alternative copyright system to 'help authors share their work while keeping their copyright and specifying certain conditions' (Videochronic 2009:51).

One of EngageMedia's counterparts and a frontrunner in the exploration and application of alternative video distribution is the Yogyakarta-based community video facilitator Kampung Halaman ('Home Village'). Kampung Halaman (2010c) was founded in 2006 by Cicilia Maharani, Dian Herdiany, Elanvito, Zamzam Fauzanafi, and M. Abduh Azis, and specifically focuses on youth as the key to social transformation. Its main programme, the Youth Media Community Lab, provides participants with training about how to conduct research, make videos, organize video screenings, start up creative media businesses, and set up local media centres. The participating groups receive assistance from Kampung Halaman for approximately two years, after which they are expected to continue their activities independently (Kampung Halaman 2010c). In November 2011, Kampung Halaman received the International Spotlight Award from the US President's Committee on the Arts and Humanities for their engagement programmes with local youth (Youth Program Awards 2011).

In collaboration with EngageMedia, Kampung Halaman has developed Depot Video, a Plumi-inspired facility that enables students, academics, and the general public to easily download and save community videos. It also publishes community videos in the form of DVDs, which are distributed for free to local communities, NGOs, schools, universities, and national and international film festivals. Another distribution strategy is monthly community video screenings, called 'Nonton bareng di kampung' ('Let's watch together in the neighbourhood'). The screenings always take place in other communities than the ones that created the videos, in order to facilitate the inter-local exchange of materials and ideas (Videochronic

2009:38). Kampung Halaman has also been involved in documentary film competitions as a means to produce and distribute community videos. [15]

Two special annual events organized by Kampung Halaman are the Indonesian Youth Media Camp and Jalan Remaja 1208 ('Youth Street/ Path 1208'). The Indonesian Youth Media Camp provides media training to young community leaders, while Jalan Remaja 1208 teaches local youth how to create and share their own videos and video blogs (Kampung Halaman 2010b; 201oe). Kampung Halaman has attempted to give a more sustainable character to community video production and distribution through the establishment of community media centres. An example is Opak House, situated near the Opak river in the Karang Ploso village in Bantul, Central Java. The centre, which consists of a library, theatre and activity room, was founded with help from Kampung Halaman in 2007, when Bantul was still recovering from the severe impact of the earthquake that hit the region on 27 May 2006. The purpose of the centre is to make the local youth aware of both the problems and assets of their communities, and to help them find a balance between individual and communal interests, and between modern and traditional communication and information media (Kampung Halaman 2010d).

An example of a community video from Karang Ploso is *My lovely flowers* (2006). This nine-and-a-half minute video was created by a group of village girls between four and nine years old. The video shows the girls wander ing their earthquake-damaged village in search of people who can be interviewed about the post-disaster reconstruction efforts. From a production perspective, this is a very simple documentary, but it enabled the young girls to re-address the impact of the earthquake with each other and other people they would normally not easily talk with, such as adult neighbours, local decision makers, and visiting students. The video is a telling example of the broader aesthetics used in many community media: relatively short narratives about local events in a local language, presented from a personal point of view, with unfixed camera or other recording positions, and deriving from a variety of fictional and documentary genres. [16]

Some local groups refuse Kampung Halaman's offer to install internet facilities in their villages, because of fear of exposure to pornography and other unwanted materials (Videochronic 2009:45). EngageMedia's plans for building an on-line community video network are not always well-received, either. Some communities have ideological objections against collaboration with other interest groups as a single network, while others fear a lack of human resources for maintaining such a network (Videochronic 2009:34). There are also groups who prefer to communicate directly with other community members rather than to try and address a relatively abstract and unknown internet audience (Videochronic 2009:46). EngageMedia itself rightly acknowledges that 'the fact that the technology exists and certain groups have an affinity for video is not enough to form effective networks. Networks must begin from common political goals and shared understandings' (Videochronic 2009:64).

[15] In December 2008, Kampung Halaman in collaboration with the Documentary Community held a workshop 'Diversity through documentary films'. Five film proposals were selected to compete for a production scholarship of Rp. 25,000,000 (approximately A$3480). The winners created the documentary *Sepintu Pemali, sedulang timah* ('At the door of Pemali, there is a pan of tin') about pluralism and multiculturalism on the 'tin' island of Bangka. In March 2009, Kampung Halaman (2010a), with support from The Ford Foundation and the Tifa Foundation, took the documentary on a highly successful road show in Bangka.

[16] This goes against Henk Schulte Nordholt and Fridus Steijlen's (2007:9) observation that community videos predominantly imitate soap opera and other popular styles from mainstream television.

Creating Common Ground

Community media facilitators and practitioners have tried to meet, exchange thoughts and materials, and create common ground not only through on-line communication, but also through face-to-face encounters. Both on- and off-line meetings provide public visibility to and education about community media, and give these media a stronger position in dealing with the competition and resistance from the social, political, and business establishment. More than just being two of the buzzwords of our time, connectivity and networking can function as effective strategies for community media initiatives to increase their accessibility and social and political reach.

An example of a face-to-face meeting that was specifically designed to create common goals and shared understandings was the community media festival Jagongan Media Rakyat, or 'Social Gathering of People's Media', held in Yogyakarta from 22 to 25 July 2010. The festival was organized by CRI with support from The Ford Foundation, the Humanist Institute for Development Cooperation (Humanistisch Instituut voor Ontwikkelingssa menwerking, HIVOS) and several other institutions.[17] In addition to practitioners from public, commercial, community, campus, and school media, it attracted the participation of civil society activists, community leaders, academics, artists, and primary and secondary school teachers and pupils (Jagongan Media Rakyat 2010a). The festival events comprised a national seminar on village poverty; workshops about handicraft, art, technology, and Open Source software; local music, dance, and theatre performances; and presentations and discussions about community media and other socio-political issues, including environmental sustainability and the rights of women and workers (Jagongan Media Rakyat 2010b).

The participation of organizations such as Sekolah mBrosot illustrated that the festival organizers acknowledged the importance of education in advancing the development of community media. Sekolah mBrosot is an informal education and activity centre in the village of Brosot, located in the Bantul area south of Yogyakarta. The centre organizes many activities, especially for children and women, ranging from theatre and literature to handicraft and cooking workshops. It also comprises a professionally run library with an impressive array of local, national and international literary and academic references.[18] These references provide the community with a means to contextualize historically, socio-politically and/or theoretically their self-representations in artistic activity and other media. The library is not only an invaluable source of knowledge for the Brosot community, but also attracts scholars and students from Yogyakarta and beyond. Although the favourable material and intellectual conditions of Sekolah mBrosot may not be available to the majority of other alternative art

[17] The idea of the festival was developed by Akhmad Nasir, then Head of CRI and a Social and Political Sciences graduate from Yogyakarta's Gadjah Mada University. Nasir originates from Timbulharjo and was the main force behind the various Angkringan community media initiatives.

[18] It consists of the collections of the founders of Sekolah mBrosot, the public intellectuals and human rights activists Hersri Setiawan and Ita F. Nadia, and also includes donations from the Indonesian publishing company Gramedia and one of the Monash University libraries in Melbourne. In the 1960s, Setiawan was the Head of the Central Javanese branch of LEKRA. After years of imprisonment in Indonesia and exile in the Netherlands, he returned to Indonesia in 2004 to re-engage with cultural activities and youth in his home village. Although Sekolah mBrosot does not espouse any particular political ideology or art theory, the community-based character of its library and creative activities is not surprising considering Setiawan's background.

and media initiatives, the school could nevertheless serve as a model for the integration of community media in a wider educational context.

The central event of the Jagongan Media Rakyat, the national seminar of 22 July 2010, was meant to identify and find solutions for problems with the collection of correct data about poverty levels in Indonesia. These problems include the use of different interpretations and variables for measuring poverty as well as delays in information updates. An example was the 2008 Bantuan Tunai Langsung ('Direct Cash Help') government programme for the distribution of cash money to poor people, which, due to a lack of reliable information, resulted in the unequal allocation of funds. The seminar aimed at developing a national information system for the collection and comparison of micro-data and statistics from various Indonesian regions. The discussions drew participants from national and regional government institutions, aid organizations, NGOs and universities (Jagongan Media Rakyat 2010c).

In the context of the development of community media in Indonesia, Jagongan Media Rakyat stood out for two reasons: firstly, an effort was made at building networks of community media and other, governmental and non-governmental, organizations; secondly, the discussion of community media was directly linked to providing education about and finding solutions for specific socio-political issues. The festival can be seen as one of the first focused attempts to strengthen the impact of community media beyond individual institutions and communities.

The use of the concept of 'people's media' rather than 'community media' in the festival's title may also signal a re-orientation from the general principles of alternative media to the more explicit political agenda of 'tactical' or radical media, which are aimed at directly influencing the opinion of the general public and key decision makers. In a research conducted by EngageMedia with the Yogyakarta-based Kunci ('Key') Cultural Studies Center, tactical video is distinguished from two other categories of 'video activism': experimental video and grassroots video.[19] I regard tactical video as a subgenre or an approach rather than a category of its own, as it hovers, by its very nature, between different forms of alternative media (Garcia 2007:6–7).

Jagongan Media Rakyat also seemed to be moving community media into the direction of creative or experimental activism by welcoming the participation of visual artists. This combined focus on education, politics and creative imagination may strengthen community media's effort to break through the dominant paradigms of the mainstream media and to expand its reach to policy makers and the general public.

Conclusion

Indonesian community media confirm Edward Aspinall's (2012) argument that after the destruction of the PKI in 1965, leftist ideas and activities of 'commitment to the interests of the 'little people', hostility to 'the elite', and the high value placed on mass action as a form

[19] According to this study, experimental video tries to change the relationship between the medium and its audience through aesthetic and technological experimentation and the deconstruction of imagery, while grassroots video attempts to transform communities by involving them in the process of media production (Videochronic 2009:26). Grassroots video is synonymous with the in Indonesia more common concept of community video (*video komunitas*), while experimental video is normally referred to as video art (*seni video*) or (new) media art (*seni media [baru]*) (Jurriëns 2009c).

of political engagement' continued to exist, in various form and degrees, during and after the New Order. This means that community media are not purely a post-New Order phenomenon, but build on and diverge from the ideas and activities of earlier socially engaged movements and genres. At the same time, however, for the majority of the post-1965 art and media initiatives analysed in this article it is irrelevant to talk in terms of 'left' or 'right', as they do not express explicit political-ideological thought.

Movements such as LEKRA and GSRB showed their social commitment predominantly by representing socio-political issues and talking on behalf of specific groups. Forms of workers' theatre, Moelyono's conscientization art and contemporary community media, on the other hand, not only provide socio-political content, but also allow social groups to directly participate in creative production, management and ownership. In that sense, there is a correlation between media content and approach or style.

This means that the analysis of social engagement in media and art needs to differentiate between social commitment and social participation. Genres of social participation can be complex, as they have to mediate the different and often conflicting interests of art and media facilitators on the one hand, and local communities and other social groups on the other. Some of the problems include the limited accessibility to and social participation in media initiatives, the lack of education about community media, as well as the limited distribution, political reach and sustainability of works, ideas and activities.

One of the overarching problems of the community media initiatives has been their fragmentation. According to Aspinall *(2012)*, fragmentation is symptomatic of the Indonesian radical movement at large, and caused, among other things, by the activists' over-reliance on NGOs:

> Different NGOs develop specialized expertise in different segments of Indonesian social and political life rather than focusing on broad agendas and alliance building. Most are organizations of professionals and intellectuals with no desire to build a mass base. They also compete with one another for donor funding. The dominance of this NGO model continues to be a chief source of the fragmentation and splintering that characterizes Indonesia's broad left today.

Aspinall (2012) acknowledges, however, that activists in post-New Order Indonesia have played an important role in putting pressing social issues on the political agenda, such as health care and social security schemes. Similarly, community media initiatives have not only brought to the surface some of the major flaws in the mainstream media system, especially the lack of diversity in ownership and content, but also tried to provide solutions in the form of alternative media programmes and structures.

The Jagongan Media Rakyat is a promising initiative to bring NGOs, local communities, government parties, artists, and others together, create a more focused socio-political agenda, and strengthen the viability and expand the reach of community media. The video archives of Kampung Halaman and EngageMedia serve similar purposes, and try to build connectivity between various community media initiatives by exploring and developing on-line technologies. While these initiatives may not be capable of or aim at creating a mass movement according to the principles of the old left, they have partly succeeded in urging and providing alternatives for a more equitable and diverse Indonesian information and communication landscape.

CHAPTER 9

Learning From the History of Alternative Communication Networks

Félix Tréguer, Dominique Trudel, and Mélanie Dulong de Rosnay

Journal of Alternative & Community Media 5, no. 1 (2020): 9–26. https://doi.org/10.1386/joacm_00072_1.

Abstract

This article explores the legal, economic and governance challenges to the sustainability of contemporary alternative Community Networks by drawing lessons and parallels from eight historical precedents. Building on academic literature related to alternative and community media, the article lays out an encompassing definition of alternative networks (or 'alternets') and develops a multidisciplinary approach to comparative history. After briefly presenting eight case studies (three independent telephone networks of the late nineteenth century; three Free Radios of the 1950s, 1960s and 1970s; two Community Networks providing Internet access in the 1990s), the article then draws from these case studies to identify key recurring challenges that can inform present-day initiatives, namely, the articulation of local community with global connectivity, the development of political advocacy capacities aimed at influencing the law and technology, the creation of appropriate resources aimed at resisting co-optation, and the need to build collective cohesion and mechanisms to handle disagreements.

Keywords

advocacy, alternative networks, commons, Community Networks, Free Radio, Internet, telecom regulation, telephone

In recent years, there has been a growing interest in Community Networks, that is alternative telecommunications infrastructures deployed and maintained by local communities to serve their needs and build up their communication autonomy (Navarro et al. 2016). Offering a third way between public authorities and market-based providers of telecommunication services (e.g., Internet access provision), some of these initiatives, like Guifi.net in Spain or Freifunk in Germany, contribute to expanding the 'Internet commons' to the physical layer of the network (Benkler 2016; De Filippi and Tréguer 2015). Community Networks, therefore, represent a form of 'alternative Internet infrastructure' with the potential to challenge the political economy of the Internet, one marked by a growing concentration and commodification (McChesney 2013). But Community Networks are only seldom historicized on the *longue durée*, in the context of similar historical endeavours such as community telephony and radio. On the short-term time scale of event-driven history, the literature on Community Networks is also sparse (Tréguer and Trudel 2019). Scholars and practitioners concerned with the sustainability of these initiatives, therefore, miss out on some of the lessons that past alternative networks or 'alternets' may offer.

Throughout the nineteenth and twentieth centuries, the telegraph, telephone, radio and television were also disruptive technologies. And as many scholars have shown, contemporary debates over the control of the Internet—issues of access, privacy and freedom of expression, oligopolization and neutrality—are reminiscent of older political conflicts over the development of these pre-digital communication technologies (Wu 2010; Pickard 2013, 2015a). In different ways, these technologies saw the advent of 'alternative networks' built to resist hegemonic models. To do so, they developed strategic action repertoires and cultural-ideological frames, explored alternative technological designs or organizational strategies with the goal of transforming their cultural, political and legal environment.

In this article, we seek to explore the history of these alternative communication networks to inform the action of contemporary community-based networks. Our hope is that through the lens of history, contemporary issues and challenges surrounding Community Networks may benefit from new insights and appear in clearer terms. To do so, we begin by laying out definitions of alternative communication networks by drawing on existing literature. Taking inspiration from various traditions of communication history, we propose an original, multidisciplinary approach to embarking in this form of comparative history concerned with today's struggles for emancipation in the media and telecommunication fields. After briefly presenting the eight case studies (fully developed in a research report from which this article is adapted, see Trudel and Tréguer 2016), we move to the lessons learned and identify four overlapping challenges for the sustainability of alternative networks. Of course, such exercise is risky business: if communication technologies are shaped by their environment, it necessarily implies that all case studies are somehow unique as they belong to very specific contexts. In this sense, all parallels we can offer are nothing much more than parallels as the past and the present never quite coincide. French historian Nicole Loraux (2005: 135) advocates for a 'reasoned used of anachronism', emphasizing that, when working in a regime of

anachronism, there is much 'to be learned from the process of returning to the present'. In that spirit, and while remaining wary of the risk of overemphasizing historical continuity, we seek to enlighten present stakes by drawing lessons from the past. As argued by Pickard, the emerging media reform movement can learn useful lessons from past reform movements, as 'history can provide guidance and help steer this new movement away from past mistakes' (2015b: 124).

Defining 'Alternativeness' in Communication Networks

First published in 1970, Enzensberger's *Constituents of a Theory of the Media* provides a useful starting point for conceptualizing alternative communication networks. Enzensberger (2003) proposed a typology of the 'repressive' and 'emancipatory' use of media that echoes contemporary discourses about the emancipatory potential of Community Networks. While the repressive uses of the media reflect and are characterized by centralization, unidirectional communication, depoliticization, and the control exercised by specialists and bureaucrats, emancipatory uses are associated with and supported by decentralization, multidirectional communication, political mobilization and self-organization.

This typology raises interesting questions. The opposition between repressive and emancipatory uses may be too sharp to grasp the multiplicity of uses and their political dimensions. For example, one may argue that all media are characterized by minimal forms of specialized work and politicization processes. Enzensberger also implies that all broadcasting media (one-to- many transmission) such as radio and television are inherently repressive. Conversely, many emancipatory uses mentioned by Enzensberger (decentralization, multidirectional communication, self-organization) are general characteristics of the original Internet, which is also partially controlled by powerful state and private actors.

Although useful, Enzensberger's typology must be considered with care in order to grasp the dialectical relations between repressive and emancipatory uses of media. In other words, rather than identifying predetermined characteristics of alternative and mainstream media, we should fully embrace the complex dimensions of 'alternativeness' throughout history in order to reconstruct different iterations of alternative media and networks as commons. We should also consider centralization and unidirectionality not as a technical fate or choice of design, but rather a social construct resulting from contingent governance models, for which alternatives are possible (Dulong de Rosnay and Musiani 2016).

Recent scholarly discussions on media alternativeness focus on the specific context of the Internet. Preston (2001: 209), for instance, notes that alternative Internets were found in online applications that 'manage to challenge and resist domination by commercial and other sectional interests', in particular those 'operating as alternative and/or minority media for the exchanges of news and commentary on political and social developments which are marginalised in mainstream media and debates'. In similar ways, Fuchs (2010) argues that alternative media are 'critical media' that questions domination and expresses the standpoint of oppressed groups or individuals. For Sandoval and Fuchs (2010), the defining characteristic of alternative media is to contribute to emancipatory social transformation. In a different manner, Atton (2005) writes that alternative online media are 'produced outside the forces

of market economics and the state' (2005: 3). In these definitions, alternativeness is measured in distance from the centres of state and capital (Tréguer et al. 2016).

Adopting a broader perspective, Bailey et al. (2008) situate alternative media 'in relation to mainstream media; as embedded in the citizenship politics of civil society; as a means for self-representation by communities, and as a hybrid form of independent media challenging established relations of authority and control' (2007: x). Couldry (2015) defines alternative media with regard to voice, understood as

> the expression of opinion, or, more broadly, the expression of a distinctive perspective on the world that a political system could acknowledge […] voice being the value that motivates the production of alternative media […] the possibility to be listened to.
>
> (2015: 44)

These competing definitions may be complemented by Cardon and Granjon's (2010) distinction between 'expressive criticism' and 'anti-hegemonic criticism'. While some alternative media are defined by their mission of giving voices to marginalized groups (what the authors call 'expressive criticism'), other are characterized by their critique of mainstream capitalist media ('anti-hegemonic criticism').

Following up on these different definitions, we posit that alternativeness is best understood through examination of many different dimensions, such as the funding and economic models, the governance schemes and decision-making mechanisms, the underlying content and, most crucially, the political values that it circulates, enables or that is embedded within it. In this sense, there are no strict boundaries between alternative and non-alternative media. For example, at least some of the so-called mainstream media tend to criticize (at least some aspects of) neo-liberal politics or give voice to oppressed or under-represented groups. But does it suffice to make them 'alternative media', even if they are controlled by capitalist corporations and can arguably be counted as guardians of political orthodoxies and of the existing power balance? Of course not.

The same can be said of alternative media which, to varying degrees, are articulating dialectical contradictions. In that spirit, Sandoval and Fuchs (2010: 147) have argued for 'politically effective alternative media that in order to advance transformative political can include certain elements of capitalist mass media'. According to them, subscription fees or even advertising might be necessary to reach a broader audience and gain political efficacy. In other words, 'alternative' is not a substantial quality of a given media or network but a useful starting point to identify a wide range of heterodox discourses and practices aimed at (re)constructing communication technologies as a vehicle for emancipatory politics.

A final theoretical distinction to be made is that between 'alternative media' and 'alternative networks'. Although both terms largely depict the same reality, 'networks' refers to the physical and distributed infrastructure of communication, whereas 'media' inevitably evokes centralized 'mass media', that is a specific socio-technical assemblage making use of that infrastructure. In speaking of alternative networks, we thus aim to expand critical reflections about alternative media to communication infrastructure and their political economy. It is also an attempt to connect our own work and the scholarship on alternative media and their sustainability to the also alternative production and governance model of the commons—in particular to the emerging studies on 'infrastructure as a commons' (Frischmann 2007)—while

remaining bound to the rich tradition of alternative media scholarship and to its focus on the critical function of alternative media.

A Multidisciplinary Perspective

Approached from a multidisciplinary perspective, the analysis of eight case studies selected in this article (three community telephone networks of the late nineteenth century, three Free Radio stations of the 1960s and 1970s, two Community Networks providing Internet access in the 1990s) takes place at the intersection of five different fields of inquiry and proposes a specific contribution to each of these fields.

First, our approach inherits from the historical sociology of social movements. We conceptualize contemporary Community Networks as forms of social movements to the extent that these collectives are made up of actors characterized by a 'set of opinions and beliefs in a population which represents preferences for changing some elements of the social structure and/ or reward distribution of a society' (McCarthy and Zald 1977: 1217–18). In a slightly different way, Tilly and Tarrow (2015) emphasize the collective political action and practices undertaken by social movements, defined as 'a sustained campaign of claim-making, using repeated performances that advertise the claim, based on organisations, networks, traditions, and solidarities that sustain these activities' (2015: 8). Drawing from these definitions, we seek to study the mutations over time of these movements in constantly shifting contexts. As Deflem and Lee Dove (2013) remark, 'historical sociology is not a mere study of the past, but an intrinsic part of a sociology of the present: in order to explain the structures of contemporary societies, one must investigate their historical origins and development' (2013: 293). For this article, the complex co-shaping of alternative networks, communications technologies and communications law specifically concerns us. Historical comparative analysis is especially suited to our goals since it 'is defined by a concern with causal analysis, an emphasis on processes over time, and the use of systematic and contextualised comparison' (Mahoney and Rueschemeyer 2003: 6).

Second, our approach is grounded in the field of media history. Like most fields of historical inquiry, media history focuses on dominant actors and mainstream uses, while the history of struggles over new technologies still remains largely to be written (see Pickard 2015b). However, various historiographical streams have sought to move away from canonical narratives. In the late 1980s and early 1990s, social history of media began to describe the complex co-shaping of technologies, politics and culture. More recently, Acland's (2006) inquiry into 'residual media' has sought to uncover experiences, meanings and values that are latent in contemporary media cultures and that can potentially be reactivated by means of history. By looking at these latent pasts and to the complex co-shaping processes, our research aims to further develop such historical perspectives showing that even prior to the Internet, communications infrastructure already operated as 'sites of cultural contestation' (MacKenzie 2005: 269).

Third, this analysis is informed by the political history of the Internet. Moving away from single-sided narratives that have achieved iconic status—studies focusing on a handful of over-quoted contentious episodes and generally over-representing North America, or scattered accounts that have so far escaped the notice of Internet researchers (see Tréguer

2017)—we aim to move away from US-centric scholarship to make both cross-temporal and cross-national comparisons. In doing so, we try to break away from the persisting myth of the Internet's radical 'newness'.

Fourth, our perspective inherits from the history and the governance of the commons. In *Das Kapital*, Karl Marx described with great attention the enclosures of the commons in England. Marx's works inaugurated a stream of historiography that was further developed by Marxist historians such as E. P. Thompson and Christopher Hill and, more recently, by Derek Wall (2014). These historians rejected the narrative of the 'tragedy of the commons' according to which commons necessarily fail because of the so-called 'free riders' taking advantage of the shared resource (Hardin 1968). Rather, for these authors, the destruction of the commons was 'a key stage in the creation of a market-based social system' (Wall 2014: 13). Our contribution to the history of the commons also pays attention to the history of communication technologies and inscribed it in the history of information and knowledge commons (Hess and Ostrom 2007), which have been subject to forms of commodification that have led to a 'second enclosure movement' (Boyle 2003).

Lastly, our approach inherits from scholarship coming from the field of science and technology studies. In this field, the social construction of technology developed as a conceptual framework to understand how technologies and media are shaped by numerous actors and their practices (Bijker et al. 1987). Adopting such a perspective, our case studies give equal attention to technical, social, political, economic and legal factors that are shaping emerging communication technologies. We were specifically interested in exploring the so-called 'phases of interpretative flexibility' (Bijker et al. 1987) during which different groups are adopting competing technological designs and practices.

Choice of Case Studies

Our research investigates three different communication technologies and models of communication: the telephone (point-to-point communication), the radio (one-to-many communication) and the early alternative Internet access providers (many-to-many communication). For each of them, we surveyed historical episodes during which actors tried to challenge the stronghold of state or market actors at moments when the future of the technology still seemed open. Presented in more detail in our research report (Trudel and Tréguer 2016), our case studies focus on three independent telephone networks at the turn of the nineteenth century and on the specific challenges they faced. In the American Midwest, independent telephone networks faced the rising hegemony of AT&T. In Sweden, the telephone cooperatives faced the monopoly of the State over long-distance lines. In France, local governments and local business communities enjoyed a large degree of autonomy in developing the telephone before turning over the network to the Ministry of Post and Telegraph. For alternative radio networks, we looked at the case of Radio Pacifica in the United States, created in 1946 and originally anchored in the Pacifist movement. We then moved to the British pirate radios of the 1960s and to the French Free Radio movement of the late 1970s, which both challenged the state's monopoly over broadcasting. Our last two case studies get ever closer to the present by looking at two Community Networks that appeared in the 1990s. Founded in 1992 and still active, the French Data Network (FDN) was the first Internet access provider available

to the general public and played a key role in defining French Internet activism. Founded in 1999, Consume.net was tied to the London counter-cultural scene and took advantage of the apparition of Wi-Fi protocols to subvert incumbent telecom operators' hold on the 'last-mile' of networks.

One may ask, why study the telephone, radio and citizen Internet networks instead of other media technologies, such as the telegraph and the newspaper? Why focus on a country or a case rather than another? These are important questions to answer.

The telephone industry is probably the paradigmatic example of the development of communication networks during the twentieth century. In the United States, the cinema, radio and television industries all modelled themselves on Bell and AT&T (Wu 2010). Following that model, they became centralized industries with monopolistic tendencies, and they were helped by the state all along this process. In this respect, the struggle opposing Bell/ AT&T and the independent Community Networks exemplifies some aspects of the struggles that were fought throughout the twentieth century by other forms of alternative media and networks. Another reason to study the telephone is the profound similitude between telephone networks and today's Internet. Both are communication technologies that enable interpersonal communications, allowing 'co-presence'. In this sense, they are much more alike than broadcasting technologies like radio and television.

The Free Radio movement is quite a different business. Unlike the struggles over the telephone, the Free Radio movement had a transnational component. In Europe, pirate radios were broadcasting simultaneously to various national audiences. They influenced one another and collaborated on several occasions, including through the *Fédération Européenne des Radios Libres*, established in 1986. Consequently, they were repressed with new transnational legal instruments such as the European Agreement for the Prevention of Broadcasts Transmitted from Stations Outside National Territories of 1965. As an international social movement, Free Radio is interesting because it echoes today's global networked struggles over issues such as Net neutrality as well as the transnational coordination of Community Networks (Tréguer and Dulong de Rosnay 2018). Also noteworthy is the fact that the Free Radio movement was connected to larger movements of media criticism and media activism (Brinson 2006). It cannot be separated from new forms of discourse and knowledge, including forms of policy advocacy, political activism and media criticism that were fuelled by academic research and that can be traced back to the post-war radio reform movement (see Pickard 2013). For example, the founders of Radio Pacifica were influenced by the work of Charles Siepmann, one of the most important radio scholar and reformer of the post-war years (Lasar 1999). This echoes contemporary struggles with their forms of cross-fertilization between Community Networks, researchers and advocacy groups focused on defending digital rights and/or information and knowledge commons (Tréguer and Dulong de Rosnay 2018).

Finally, the early Community Networks providing Internet access that developed in the 1990s and early 2000s are the historical matrix and the first experiments leading to today's Community Networks. Most of them did not survive (or were radically challenged and transformed by) the rise of the commercial Internet service providers in the mid-1990s. Unlike the case studies on the early independent telephone networks and Free Radio movement, which were based on existing historiography, our analysis of FDN and Consume.net is mostly based on interviews and primary sources (see also Tréguer and Trudel 2019). Our work, therefore,

contributes to the historiography of the Internet and of community media, which has so far overlooked these actors, one important exception being the late Medosch's (2014) unpublished history of early Wireless Community Networks, The Rise of the Network Commons.

Another guiding principle consisted in selecting cases that differed from each other, in order to better account for the diversity of alternative and Community Networks. For example, as many historians pointed out to the similarities between the Italian and French Free Radio movements—the Italian case representing the 'prototype of a new problem' (Raboy 1993: 132)—we decided to study only one of them. A further criterion was the historical significance of the case: Did this episode had enduring effects? Did it inspire others or marked a breaking point, a 'critical juncture' in the political economy of the media (McChesney 2007: 10)? A last concern was the heuristic and pedagogical value of the case studies to reflect on issues faced by today's Community Networks.

Methodology

Once our case studies selected, we identified and read carefully the relevant literature or, alternatively, interviewed key actors involved in setting up Community Networks in the 1990s (see Table 1 or Trudel and Tréguer 2016 for a detailed account of the bibliographical sources). We approached these writings and these interviews with four sets of loosely defined intertwined questions, as we looked for both transversal patterns and singularities. These questions benefited from an iterative research process that took the form of a cross-reading of the historical literature about our cases studies and of the recent works about Community Networks. First, we looked at the specific repertoire of strategic actions employed by these alternets and on their effects. Second, we focused on the co-shaping of technologies and the political/legal environment, as we were concerned by the capacity of these alternets to change their cultural, legal and political environment. Third, we turned to the relations of these alternets with state and market actors, and on the various forms of co-optation they faced and try to resist. Fourth, we revisited the cases looking for implicit or explicit concerns to the commons (or other related concepts). Drawing from the various answers to these questions, we were able to identify four challenges regarding the sustainability of contemporary Community Networks.

Case studies	**Main historical sources**
Independent Telephone Networks, the United States (1893–1907)	Atwood (1984); Beauchamp (2015); Casson (1910); Gabel (1969); Holcombe (1911); John (2010); Latzke (1906); Fischer (1992); MacDougall (2014, 2015)
Cooperative Telephone Networks, Sweden (1883–1910)	Bennett (1895); Bonow (1938); Brault (1888); Holcombe (1911); Huurdeman (2003); Kaijser (1987); Webb and Cox (1911)
Municipal Telephone Networks, France (1888–99)	Aulas (1999); Bennett (1895); Bertho and Carré (1994); Holcombe (1911); Leroux (1991); Webb and Cox (1911)
Radio Pacifica, the United States (1946–present)	Land (1999); Lasar (1999); 2015; Walker (2001)
Radio Caroline, the United Kingdom (1964–80)	Chapman (1990); Johns (2011); Lesueur (2011); Robertson (1982)

Case studies	Main historical sources
Radio Verte, France (1977–82)	Bénetière and Soncin (1989); Lefebvre (2011); Lesueur (2011); Méadel (1994); Ulmann-Mauriat (2000)
French Data Network, France (1992–present)	Bayart (interview); Chemla (interview) Nicaise (interview); Paulus (interview)
Consume.net, the United Kingdom (1999–2003)	Stevens (interview); Medosch (2014); Priest (2016)

Table 1: Overview of the cases studies and main historical sources.

Challenge #1: Articulating the Local and Global

A first challenge that can be identified from our journey in the history of alternative networks is tied to tensions between the local, national and global geographies of alternative networks. In the late nineteenth century, for the American Independent telephone companies, the telephone became not only a medium for peer-to-peer communication but also a civic media—what Carey (1989: 147) called 'an extended town meeting'—contributing to the social conversation in a world thought to be increasingly atomized. But the ability to establish long-distance links interconnecting local networks quickly became a necessity to make these initiatives sustainable. The US telephone independents' failure to cooperate to build long-distance networks eventually weakened their utility and enabled AT&T to frame itself as a legitimate hegemon in order to realize the full potential of the telephone (Gabel 1969). In France, the original compromise made by local telephone networks with the central state to ensure national and international connectivity eventually led the latter to recentralize the network around Paris, rather than developing connectivity around regional urban centres. Swedish cooperatives initially fared much better, setting up appropriate coordination mechanisms between them (Kaijser 1987). But as we will see, their aspiration for interconnection would also seal their fate.

These tensions regarding to the local and the global were creatively dealt with by Consume.net at the turn of the 1990s, when it brought a major innovation to Internet politics by going against the globalizing tide. Whereas the first motivation of FDN had been to bring global connectivity to French tech-savvy people—one which for some time at least made it vulnerable to turning into a for-profit venture—Consume.net's activists wanted to make a claim, as they saw the Internet being fast-moulded into the macro-economic structures of global capitalism. The alternative, then, would be to conceptualize Internet-like networks organized by local communities. Sure, Consume. net's activists were aware of the fact that they needed to be connected to the global Internet to maintain relevance. But unlike the Independents of early telephone networks in the United States, long-distance interconnection was a feature widely available, and in their specific historical context, it was one they sought to counter-balance. To do so, they experimented new online media forms emerging from local communities, helping them to find their own voice and mediate it through online media, much like Free Radio had done a quarter-century earlier. The irony was that such initiative was made possible by a technical innovation—Wi-Fi brought about by the International Telecommunications Union, an international and corporate-friendly organization, and was first made available to the general public with the launch of Apple's Airport device. But that irony made the initiative all the more subversive: In allowing them to bypass the last-mile

networks of corporate telecom providers, Wi-Fi could almost be framed as the manifestation of capitalism's self-destructive impulse (the ambivalence also reflected in the polysemic name of the initiative). But Consume.net's approach had a much more pragmatic component: like for FDN in its early days, taking part in the global Internet was costly. Sharing costs was a way of making it more affordable, and both FDN and Consume.net understood that the more the participants joined, the cheaper the community's total bandwidth costs would be.

Consume.net also sought for creative ways of bridging the local and the global. As MacKenzie (2005: 281) noted, Consumet.net was key in early attempts to 'engineer the connection of local networks into extensive ad hoc informal meshes of wireless nodes across local and national boundaries'. That joint effort took the form of the Pico Peering Agreement (PPA), a document first presented in 2003 which aimed to safeguard the values of privacy, neutrality and openness promoted by Consume.net and the then growing movement around Wireless Community Networks. The PPA held the potential of creating a network of Community Networks that would represent 'a viable and competitive supplement to the Internet, but one where the system of ownership is decentralised enough for it to remain a common' (Alberts cited in MacKenzie 2005: 281).

The original idea of a Peering Agreement that would allow local Community Networks to federate at the national and transnational levels lives up to this day, but mostly under the form of experiments Community Networks usually prefer to send out their traffic to global networks through traditional telecom operators. But in the face of possible 'kill switches' where these corporate actors could decide to disconnect the community from global networks, the PPA still points to a possible workaround ensuring the resiliency of alternative networks, and a way to gain full autonomy in articulating the local and the global.

Challenge #2: Organizing a Political Defence Through Law and Technology

Reviewing the history of alternative networks points to the importance of the co-shaping of law and technology for the fate and the design of alternative networks. As argued by Lessig (1999), these two different forms of 'code'—legal and technological—create and constrain the affordances of communication networks. In many cases, the normative power of law and technology interpenetrated to open (or foreclose) a path for alternative networks. For example, the case of early telephone networks shows the importance of patents (or their absence) in hindering (or providing) small alternative players' access to key technologies and shaping of telecommunications markets. In the United States, AT&T's early twentieth century claim that the telephone was a 'natural monopoly' would not have been so convincing without Bell's first monopoly (1876–93), based on Bell's patents. The case of Sweden also proves the importance of patent laws over the development of telecommunications. The development of the Swedish telephone industry, including the key role played by the cooperatives, was to a certain extent shaped by the absence of Bell's patents. Thanks to the absence of intellectual property or legal enclosure, the field was open to unexpected technical choices and alternative players.

In the early 1970s, the end of the state monopoly over broadcasting in Italy led to a strong demand for radio broadcasting equipment, which, in turn, made such equipment available to activist groups based in France and fuelled a movement that would eventually end the state monopoly there too. Later, the Free Radio movement would, however, become mar-

ginalized through legal reforms leading to licensing schemes that systematically favoured commercial players over grassroots groups (Lefebvre 2011). In the 1990s, the International Telecommunications Union decision to open up Wi-Fi frequencies to unlicensed use led to the introduction of new radio devices that allowed for significant changes in the political economy of last-mile networks, sparking the so-called Wi-Fi revolution that gave birth to the first Wireless Community Networks. Today, regulations like the 2014 European directive on radio equipment change the liability regime for equipment providers and endanger the freedom of Community Networks to install new software on these devices and serve their specific needs and values, therefore their techno-legal sustainability (Tréguer and Dulong de Rosnay 2018).

Sometimes, technology can also act as a substitute to the law, or a way to force changes to the regulatory framework. For example, in Sweden, a 'technological ruse' used by the Telegraph Board (rather than strict regulation) eventually put an end to the movement. While the cooperatives were mostly using single-wire systems, the Telegraph Board strategically decided to interconnect only the networks using a double-wire system, although the two systems were technically compatible. The Telegraph Board accepted to finance the transition of local networks to double-wire system on the condition that it was given the opportunity to buy the networks. Fearing isolation, the cooperative companies accepted the trade-off one after the other. According to Kaijser (1987: 12), the subscriber's desire to be able to make interurban calls was stronger than their desire to own their telephone networks'. In 1907, there were only seventeen surviving cooperative telephone companies—fourteen of them located in rural areas—connecting only 971 telephones (Holcombe 1911). Three years later, the cooperatives had all been absorbed by the state telephone system or by its private rival, Allmänna Telefonaktiebolag.

In other cases, technology allows to circumvent the law altogether, or make it obsolete. Pirate and free radio stations used radio to subvert the state monopoly from international waters or terrestrial hideouts. In 1984, the *Telecommunications Act* (UK) banned the roll-out of landline infrastructure on the public realm. But Wi-Fi technology did not require physical access and could be used to bypass the tedious conditions and procedures required to roll out physical infrastructure, circumventing the practical chilling effects of the new legislation. In other words, technology might be used to exploit some of the cracks of the legal system or serve as a way to escape it altogether.

These general remarks point to the fact that law and technology are the 'master regulators' of alternative networks. Law appears to be the most important because it can mandate technological change, but technology is the primary driver as it is out of practical feasibility and economic convenience that alternative networks can emerge. According to these observations, Community Networks should self-organize to establish and maintain reflexive strategies than can help them influence technological and legal developments.

Challenge #3: Resisting Co-Optation Through Economic Sustainability

This last point leads to another insight, namely, the fact that alternative networks are likely to be co-opted by market actors or the state. Again, and again, we have seen alternative networks or some of their key players being swallowed up by the very actors, structures or

economic logic they were serving as an alternative for. Co-optation can take many forms. The first US independents that sold out to AT&T weakened the whole movement and provided further justifications for lawmakers to sanction what was becoming AT&T's de facto monopoly. Local telephone authorities in France were from the start ready to devolve their telephone networks to the state, but they eventually found out that the later performed poorly in maintaining and expanding these networks and that co-optation by central authorities came with important drawbacks. For the British Radio Caroline, as soon as the BBC launched new channels, the former star hosts of the pirate stations effectively moved to working for the state. The 'self-co-optation' of many of Consume.net's participants, who left to work in the tech industry, also suggests that when volunteer based, a network commons will often be difficult to sustain in the long run.

Our case studies suggest a possible counter-strategy that consists in establishing partnerships with well-established actors. Here, local authorities appear particularly important. In early US telephone networks for instance, local governments were hostile to Bell's monopoly and did use their powers to the independent's advantage. The strategy only failed when AT&T successfully teamed up with the federal government and was granted the right to buy its competitors and strengthen what many state officials thought to be a 'natural monopoly'.

In her study of Île Sans Fil, a Montreal-based community Internet provider, Powell (2008: 1069) describes how the establishment of a partnership between the city and Île Sans Fil constituted a turning point as it provided 'sustainable funding and a more conventional organisational structure'. Getting the support of public authorities may offer interesting assemblage between the 'public service' logic that the latter are supposed to embody, and the citizen-owned and governed nature of the commons. Building such 'public-commons partnerships' between commons-based networks and a 'partner state' (Kostakis and Bauwens 2014) points to the challenge to overcome the latent—and often justified—distrust of many alternative networks actors towards state authorities and institutional politics.

Other potential solutions consist in fostering alliances between alternets and local professionals and businesses. Of course, this can be done out of shared, disinterested values: FDN and other more recent Community Networks rely on the volunteer labour and generosity of some of their active participants, some of which are connected to small- and medium-sized businesses that offer material and technical support. But governance frameworks can be designed in a way that creates an incentive for businesses to grow alternets. This was key in France's early local telephone networks, where local businessmen partnered with local authorities to find innovative funding schemes. Here again, Guifi has already proved very innovative, building local partnerships with both private and public entities, leveraging taxpayers' support as well as business incentives to grow the telecom commons (Navarro et al. 2016). These alliances with businesses might be controversial, but not only can they bring key resources to alternative networks; they can also help them spread their values within the commercial realm. Through such partnerships, Consume.net might have been able to grow along with the adoption of Wi-Fi hotspots by local businesses (like restaurants), grow stronger, and eventually pre-empt the instance of 'commons-washing' represented by telecom providers' commercial hotspots, like BT's 'Openzone'.

Challenge #4: Building Collective Cohesion

Though often operating at a macro scale, some of our case studies point to the ideological diversity of alternative networks, as well as to the various relationships and strategies of their participants with regard to the political sphere and the action repertoires developed to influence them. Milan (2013) provides an interesting typology to understand these varying approaches to politics in her analysis of emancipatory communication practices: (1) *Beyonders* acknowledge the failure of dominant institutions to answer their needs, and prefer to remain beyond the political system by focusing on the building of self-organized, decentralized and citizen-owned communications networks; (2) *Outsiders* pressure both regulators and incumbents from outside the political system, by means of protests, demonstrations and other campaigning tactics aimed at voicing dissent against the practices of commercial Internet access providers and against the lack of appropriate regulation for Community Networks; and (3) *Insiders* interact with public officials and regulators in order to make them support the deployment of Community Networks. This approach calls for the development and use of capacities for advocacy and mobilization, and the willingness to enter into negotiations with power-holders.

Our case studies suggest that alternative networks typically start as initiatives developing Beyonder strategies, taking the matter into their own hands to meet their need for communications. When the context turns more hostile, for instance when market and state actors coalesce to hinder their development or repress them, they develop oppositional strategies aimed at resisting this trend (legally and technically) and, in such context, generally manage to overcome their political differences.

The hardest part is to maintain some degree of cohesion when alternative networks need to articulate a positive agenda to policy-makers. In France, the Free Radio movement followed this trajectory. After the opening of the first stations, the government sought to crack down on this burst of free radio expression which contravened the government's exclusive right to public broadcasting. TéléDiffusion de France (TDF) sued several free radios in courts and sought to jam their transmissions. And as is often the case in the history of communications and other emancipatory struggles, repression led to technical and legal resistance. In Fessenheim, Alsace, a local Radio Verte was launched in June 1977. After having coped with several jamming attempts and successfully escaped a police arrest in the middle of a broadcast, the struggle became truly technical. As a Radio Verte activist explained,

> our only possible reaction was to have a deeper penetration in all the layers of the population […], to multiply the number of transmission sites so as to be even more powerful than TDF. Our strategy was to oppose decentralization to the centralism of the monopoly.
>
> (Lefebvre 2011: 139)

The movement quickly organized full-fledged legal strategies. In September 1977, some of its most active members created the Association pour la Libération des Ondes (ALO), which benefited from the support of prominent intellectuals, including Gilles Deleuze, Félix Guattari and Umberto Eco (Lefebvre 2011). The organization was meant to coordinate the political and legal defence of the emerging movement while coordinating with their counterparts elsewhere in Europe. In 1978, they fought the French government's bill aimed at boosting

the repression of the movement through petitions, manifestos, court challenges or drafted alternative bills that met their demands. But the movement's bill was aligned with the self-proclaimed 'pragmatist' side of the Free Radio movement opened to advertising, which alienated those who opposed commercialism and more generally represented an important cause of disagreement and fragmentation within the movement (Félix Guattari, for one, left the ALO over its acceptance of advertising to create the Fédération Nationale des Radios Libres). As elsewhere in Europe, the various reforms of the audio-visual sector adopted in the 1980s launched a wave of commercialization and concentration (Hesmondhalgh 2007). The state monopoly had fallen, but a new public-private hybridization would succeed in making the subversive agenda pushed by many in the Free Radio movement a marginal though vocal component of the French media landscape.

Divergence regarding the relation to market actors and resort to commercial-like models is also likely to be controversial for today's Community Networks, which have different political approaches to commoning. Papadimitropoulos (2017) sees three major political currents supporting the commons: the liberals, who anchor their defence of the commons through liberal theory and as middle-way between the state and the market; the reformists, who argue for the gradual adjustment of capitalism to the commons with the aid of a 'partner state'; and finally, the radical anti-capitalists who favour the commons 'against and beyond' capitalism. According to him (2017: 563), if the defenders of the commons are to overcome their contradictions and build solidarity despite their differences, 'a global institutional reform, followed by a number of inter-local and international principles, is sine qua non'. His point further stresses the need for building forms of political organization that can turn Community Networks into an actual social movement, with some degree of coordination, a common agenda and mechanisms to handle political disagreements—or at least push them aside when confronting institutions. The temporary synergies between Consume. net, marked by an anarchist ethos, with the 'reformist' group Campaign for Unmetered Telecommunications—which focused on getting lower prices and unlimited offers in commercial broadband—demonstrate that these can be quite effective: They successfully pre-empted BT's attempt to get lawmakers to outlaw Consume.net by extending the 1984 rule regulating the deployment of wired lines across the public realm to wireless transmission.

Conclusion

Grounded on the analysis of eight precedents of alternative networks, this article has sought to contribute to a definition of alternative communication networks, while identifying several common challenges they face in terms of sustainability. First, alternative networks will always have to manage the tension between the localities they are grounded in and whose needs they should serve and the global connectivity they will most often need to provide to their constituents. Our cases suggest that such global reach will likely rely on large corporations whose values are often at odds with those of alternative networks. Strategies are needed to foster the autonomy and resiliency of Community Networks and decrease this dependence. In this regard, following the pioneering experiments related to the PPA, interconnecting Community Networks transnationally appears to be an important task. Second, alternative networks activists and scholars should be aware that legal regulation and technological de-

sign are co-shaped and co-shaping affordances and services. Community Networks should self-organize to establish and maintain reflexive strategies than can help them influence technological and legal developments. Policy-makers can support the sustainability of these alternatives by making sure to invite them at the table of telecommunications policy reform discussions. Third, there is no single solution to avoid co-optation and ensure economic sustainability. Our case studies suggest that public-commons and private-commons partnerships are valuable options to ensure resilience. Fourth, building up the legal and political defence of alternative networks is an important task. The coordination of Community Networks' actions in the policy field can indeed help tackle big structural issues hampering their growth. Although such coordination needs to account for their diversity to avoid division, alternative networks should establish alliances with advocacy and research organizations with the goal of warding off the forms of collusion diverting telecommunications and media policies from the public interest.

Of course, these are just a few possible lessons that can inform today's activists, researchers and advocates working on alternative networks. More comparative historical research would be needed to help refine and complement these few insights. But if the past can inform contemporary strategies, it is first and foremost by spurring debate, reflexivity and creativity when thinking about the present. The later retains an irreducible indetermination.

CHAPTER 10

A Brief History of CCLM/CLMP

Pauline Uchmanowicz

The Massachusetts Review 44, nos. 1–2 (2003): 70–87.

An American invention, the literary form known today as the "little magazine" emerged early in the twentieth century. Small, independent presses evolved in tandem, and by publishing year 2001–2002, the thirty-seventh annual edition of the *International Directory of Little Magazines & Small Presses* listed over five thousand entries. A goodly number of these by and large nonprofit literary enterprises, like others come and gone over the past one hundred years, owe their existence to external funding sources. In the forefront of directing financial support to literary magazine and small-press publishing, the Coordinating Council of Literary Magazines (CCLM), enlarged in 1990 and renamed the Council of Literary Magazines and Presses (CLMP), has advanced the literary arts and aided individual writers in the United States for more than thirty-five years. [1]

Pivotal in the national, nonprofit, membership-based literary arts service's inception, founding member and first secretary *(1967–72)* Jules Chametzky had the idea for CCLM's original title. A longtime champion of literary and artistic endeavors that fall outside the mainstream, his role in the naming and ascendance of the organization mirrors the inchoate raison d'etre of the little-magazine movement in general. A CCLM report com missioned by the Ford Foundation and published in 1975 suggests how.

According to the document, the little magazine came about as "the product of idealistic editors, publishers, and writers who were rebelling against [commercial] publishers' indifference to un known writers and their conservative attitudes toward the development of new means of expression" (2). Noncommercial from the outset, these forums for diverse views

[1] I wish to thank Jeffrey Lependorf, Executive Director of CLMP, for granting me access to the organization's archive, housed in their offices at 154 Christopher Street in New York City. I likewise am indebted to CLMP staff members Katherine Sarkis, Robert Casper, and Jessie Koester for providing me on-site assistance.

BY-NC

and styles published prose, poetry, criticism, and political commentary while surviving "on their philosophy of altruism or the support of patrons and friends" (2–3). The term "little magazine" as applied to such publications came into coinage around the time of the First World War. It pertained not to size, content, or the fact that contributors were rarely paid but to readership, suggesting a "limited group of 'intelligent' readers who could recognize the avant garde" (3). Many great modern and postmodern authors were later "discovered" in the "littles," including Ernest Hemingway, Anais Nin, William Carlos Williams, Marianne Moore, Ishmael Reed, and Sherley Anne Williams.

The ensuing decades also ushered in writers and mavericks who became thriving independent publishers, notably James Laughlin, who used inherited money to found New Directions in 1936 in New York City; and Lawrence Ferlinghetti, who in 1955 launched City Lights' Publishers in San Francisco on a shoestring (Feldman 4). More recent literary projects echoing the fiscal sensibilities of these progenitors include *Glimmer Train,* which Susan Burmeister-Brown and Linda Davies began in Portland, Oregon, in 1990, and support with their own private funds; and the nonprofit, California-based poetry miscellany *Free Lunch*, established by Ron Offen in 1988 and providing subscriptions "free to all serious poets living in the U.S.A." Ferlinghetti mean while remains loyal to his own pioneering ethos, advising artists and writers who came to hear him read at Woodstock Poetry Festival 2002 to eschew "government grants." But competing for audiences in a publishing arena presently dominated by ten multinational media conglomerates—all with annual revenues in excess of $16.5 billion and peaking at a $129-billion high for General Electric ("The Big Ten")—most "littles" and small presses cannot afford the luxury of the Beat granddaddy's financial integrity.

Another mid-century, noncommercial-arts visionary, Chametzky co-founded The Massachusetts Review in 1958 (Volume One, Number One, came out in 1959) to promote offbeat, nontraditional, and under-represented literary and intellectual talent. As the magazine's fortieth-anniversary issue declares, *MR* was committed to "diversity from the start." Its then thirty-one year-old co-founder sought with Sidney Kaplan, its co-editor, to recognize, represent, and give voice to African Americans, Native Americans, and other "so-called minority and ethnic" groups, including feminists and those exploring "the story of the Holocaust" (Chametzky, "Preface" 456). Soon after launching the magazine, Chametzky banded with like-minded individuals, who wished to secure publicity, growth, and solvency for the "littles." Together they engendered CCLM, "the first organization in the history of America set up solely to aid the noncommercial literary magazines in the country," as then president William Phillips noted in his report of 1969 (2).

As the inaugural secretary of CCLM, Chametzky was de facto its first historian. Piecing together a chronology from his reports and remembrances, the genesis of the organization emerges. "CCLM grew primarily out of the efforts of an earlier group, the Association of Literary Magazines of America *(ALMA)*," the one-time recorder documented in his first annual report (4). ALMA had formed in November of 1961, in St. Paul, Minnesota, at a meeting sponsored by the Carleton Miscellany, initiated by its then editor Reed Whittemore and partially subsidized by the McKnight Foundation (4). "I got a call from Whittemore to come to St. Paul and meet with other magazine editors, some what of a sentimental journey for me," Chametzky, a University of Minnesota PhD alumnus, recollected in an interview. Representatives of nineteen magazines and several publishing concerns attended. "It was

an extraordinary meeting," the then MR managing editor continued, citing among the assembled literati Victor Navasky, Allen Tate, Robie Macauley, and Robert "Bobby" Bly, who put out a poetry magazine called The 50s. "He was thinking of changing the name to The 60s. I subscribed and we became lifelong friends."

Over the course of several days, the ALMA members met in separate groups in a downtown hotel. "The people from the little magazines—we were discussing promotion, circulation, money—all those collective problems," Chametzky recalled. "But the 'big shots' were in another seminar room and came up with a statement of lofty goals, setting up a split between the established journals and the littles."

The organization continued to meet every two years, but by the close of 1965, after four years of existence, it was kaput. Commenting on its contributions to the social history of independent publishing in America in his two-year report of 1969, the former CCLM secretary noted:

> ALMA had succeeded in bringing together, in an unprecedented and rather historic way, for mutual exchange, information, [and] support, members of the diverse and various literary magazine community—perhaps thereby helping to create a sense that it was a community—and on occasion dramatizing for the public the fact and importance of their existence [4].

Despite the group's decision to formerly disband, "little" editors continued to cast about for funds, without which they believed "the literary community would cease entirely"(4). To resurrect and strengthen its esprit de corps would require a savior. A succession of brief, CCLM disciplinary annals penned over the years laud a group of men as filling this breach, but few mention the woman without whom the organization might never have arisen: Carolyn Kizer.[2] "I give her full credit," Chametzky stated unequivocally.

When Lyndon Johnson established the National Endowment for the Arts and Humanities as government agencies in 1965, Kizer, former editor of *Poetry Northwest* and a longtime active member and officer in ALMA, was appointed Director of Literary Programs; Ralph Ellison and John Steinbeck joined her on the board. As Chametzky related, it was Kizer who had the "original impulse" to channel money from the federal government to little magazines and pay authors out of the pot. Convening in New York City in February of 1966 to discuss "fresh methods" for funding the literary arts, she met with Whittemore and Chametzky, former members of ALMA's executive committee; and William Phillips, editor of Partisan Review and spokesperson for the Council of Literary Magazines (CLM), "an informal grouping of five of the better-known literary mag azines in the country"(4). Also present was Caroline Rand Herron, *PR*'s managing editor. Kizer recommended that the editors draft a proposal for her to present to the NEA and see what would come of it. But sensing the wisdom of first uniting ALMA and CLM as a single nonprofit entity, Chametzky, who had been ALMA's elected president from 1965–67, said, "Let's put together both our organizations." The agreed upon merger's first order of business that day was selecting a new name.

Six years earlier, in the wake of the historic February 1, Woolworth lunch counter sit-in, staged to end racial segregation in the American south by four black freshman students from North Carolina Agricultural and Technical College in Greensboro, the Student Nonviolent

[2] George Plimpton, in charge of the pilot "literary project;" an anthology of American literature derived from literary magazines and sponsored by the NEA, was an early though not founding member of CCLM.

Coordinating Committee (SNCC) had formed (West 46–47). With student activism against escalating U.S. involvement in the Vietnam War about to explode nationwide, Chametzky thought of SNCC (which he pronounces "snick") in suggesting to the founding delegates, "Let's call it the Coordinating Council of Literary Magazines." As he acknowledged to me regarding the moniker, "Behind it was SNCC—but I wouldn't have said it out loud to Phillips; he was somewhat conservative."

By spring of the following year, a three-page statement of intent and request for a grant was submitted to the NEA in the name of CCLM and signed by the executive committee of ALMA (Chametzky, Whittemore, and George Plimpton, editor of the *Paris Review*) and CLM members (Phillips and Macauley, former editor of the *Kenyon Review*) (Chametzky, "Annual Report" 4). Their application was denied. Nevertheless, CCLM pushed to establish itself as a nonprofit, continuing through the summer to secure public or private funds and making a second appeal to the NEA. In December, the Endowment approved a matching grant of $50,000, and CCLM was underway.

A few weeks later, the national Office of Recorder of Deeds, Washington, D.C., issued in perpetuity a Certificate of Incorporation to the Coordinating Council of Literary Magazines, making official its not-for-profit educational and charitable intent. Dated January 4, 1967, the five-page document lists nine articles of incorporation, chief among them to: advance the literary arts; aid noncommercial literary magazines, individual artists and writers; enhance literary and artistic standards, including of production; provide for literary projects and conferences of writers and editors; and give awards, scholarships, fellowships, grants, and other forms of aid and encouragement to literary magazines, artists, and writers. CCLM also proposed to open an information center, replete with a library to accumulate periodicals (including magazines and newsletters) and other resources deemed important to the literary magazine and small-press community.

Alone in bringing a semblance of diversity to the mostly Anglo cast of five men who signed the certificate of incorporation and constituted the initial CCLM Board of Directors (including Whittemore, Phillips, Macauley, and Carl Stover of the National Institute of Public Affairs), Jules Chametzky's name was misspelled on the charter, an "s" typo-ed in place of "z." The slip-up unwittingly presaged the Council's early growing pains on the road to becoming the inclusive organization the *MR* editor presciently envisioned back in the late 1950s.

Accepting an offer of free office space and administrative assistance from the National Institute of Public Affairs while searching for private funds to match the Endowment's grant, CCLM operated out of a Washington office from June of 1967, to October 1968 (5). "We now met in Washington in comfortable chairs," Chametzky reminisced about the period. Kizer and Whittemore secured the organization's first substantial private grants, and groundwork for its subsequent programs was laid. During its inaugural year, CCLM boasted a budget of approximately $125,000, issuing grants ranging from $250 to $3,000 to thirty-eight magazines ("CCLM Biennial Report 1972/1973" 1).

Phillips meanwhile was lobbying to move CCLM headquarters to New York City; Stover opposed the idea. Ultimately Chametzky, who viewed Manhattan as a Mecca of multiethnic literary arts activity and thus a more appropriate location from which to discharge services and dispense funds, helped Phillips "pry it loose." CCLM encamped first to a New York office donated by Coal Credit Company and then to the American National Theater and Academy.

During this early period of movement and growth, CCLM kept afloat due to the efforts of just three board members, Chametzky, Whittemore, and Phillips. Recognizing the need to broaden the group's base beyond its largely East Coast strong hold, they sought out editors from different geographic regions of the country to create a Board of Consultants to act in advisory capacity on general policy and to consider specific project requests. Early consultants included Charles Newman, editor of Chicago's *TriQuarterly*, and writer Russell Banks among the Midwest contingent, and George Hitchcock, founder and editor of West Coast publication *Kayak*, from Santa Cruz. A system of rotating grants committees drawn from the magazine community was thus established (Chametzky, "Annual Report" 5). For a time the reconstituted CCLM leadership, numbering thirteen, met every three to six months at different locations in New York to make decisions about giving out money. "Phillips was a great operator in the city and with Caroline Herron's help would get us space," Chametzky elaborated.

At one fateful meeting, twelve board members sat in assembly in a New York location and the CCLM secretary was the last person to come in the room. "One of you will betray me," he joked, to ease unspoken tensions. Someone, perhaps Charles Newman, replied, "All of us, Jules, all of us!" For as Chametzky explained to me, "Back then, editors were competitive, but we were trying to cooperate and mostly did." Voicing a perceived stumbling block to the pending success of CCLM in promoting the eclectic spectrum of journals and writers emerging on the literary arts horizons, Chametzky next proposed, "We don't have any black writers or journals."

Phillips replied that the *MR* editor suffered from "white guilt."

Chametzky lobbed back that it was more like "white responsibility." As a result of his initiative, in 1968, CCLM appointed as "special members" to the board a three-person Ad Hoc Committee on Black Literary Projects to oversee the funding of African-American magazines, writers, and artists. They included A.B. Spellman, editor of *Rhythm* and a former Morehouse College faculty member; David Henderson, editor of *Umbra*; and Michael Thelwell, director of the W.E.B. Du Bois Department of Afro-American Studies at the University of Massachusetts, Amherst, a writer whose work recently had appeared in the landmark *Best Stories by Negro Authors* (1967), edited by Langston Hughes. [3]

Launching the Black Literary Projects section of CCLM coincided with a tumultuous, uncertain period in U.S. history. Unrest on college campuses in the name of Black Power, Women's Liberation, and the Peace Movement was mounting, and many CCLM-sponsored magazines and writers had begun to speak out against the Vietnam War. Added anguish followed the Martin Luther King, Jr. and Robert F. Kennedy assassinations. The outcome of the 1968 presidential election loomed, and CCLM board members worried that the steady flow of largesse from Washington would evaporate. As it happened, Norman Sherman, press secretary to presidential candidate Vice President Hubert Humphrey at the time, had been a graduate school friend of Chametzky's at the University of Minnesota. Jules and Anne Halley had gotten married in the Shermans' living room and Anne was godmother to their child. Chametzky called the political aide and arranged to meet him in Washington, prodded at

[3] A companion volume, *Children ef the Night: The Best Short Stories by Black Writers 1967 to the Present*, edited by Gloria Naylor, was published in 1995 by Back Bay Books, an imprint of Little, Brown and Company. As a side note concerning the eventual desegregation of governance amid CCLM: the writers Ishmael Reed and Lorenzo Thomas served as members of its Board of Directors in 1976.

the insistence of presiding CCLM president Phillips, who attended the meeting along with Caroline Herron.

Seated in Sherman's living room, the CCLM secretary voiced the fear that if the Democrats lost the election his organization would lose its money. Sherman assured him, "We'll give you double."

But Chametzky, a Eugene McCarthy Democrat, insisted that they "get serious." Talk turned to Vietnam, and the magazine editors tried to convince Sherman to get Humphrey to move from the LBJ position and attempt to carry the left-progressive vote. Richard Nixon won the race, and a funny thing happened on the way to the White House. "He gave CCLM *four times* the amount of money; to this day, we still don't understand that," Chametzky mused in repeating the story.

The increase in federal funding coincided with CCLM's physical move, in December 1969, to 80 Eighth Avenue (intersecting with Eighth Street, on the border between Greenwich Village and the section known as Chelsea), an expanded facility. Alongside the geographic change, women began to move into the organization's leadership in marginal ways. Behind the scenes, following the departure in less than a year of David Bournes, Caroline Rand Herron, always an important voice in the organization, became CCLM's second executive director, overseeing day-to-day operations with staff assistant Lois Theodorou. A woman would not break the upper ceiling of the organization until January 1, 1970, when June Degnan, sister of poet George Oppen and then publisher of the *San Francisco Review* (associated with New Directions Press), became a consultant to the board. Finally, Beat poetry grande dame Anne Waldman would sit on the primary board of directors and poet Siv Cedering Fox serve as a consultant in 1972–73—the only two visible women in the leadership besides Herron in as many years. By 1976, with poet Leslie Silko among the headcount, only four out of seventeen CCLM board members and consultants were women.

Despite race and gender imbalances within its directing body, the late 60s and early 70s also ushered in a time of strong federal funding for CCLM, almost half the money coming from the NEA. Able to re-grant funds directly to various literary magazines, the organization's boon to the independent publishing world—past and present—cannot be overstated. CCLM grantees with addresses (many listed as New York apartment numbers) as of December 31, 1969, numbered just over one hundred; as of August 2002, the active membership roster exceeded 350. Many listed in 1969, such as *Love Letter* (Berkeley, California), *0 to 9* (New York, New York), *Pebble* (Lincoln, Nebraska), *Mele* (Honolulu, Hawaii), and *Transpacific* (Ft. Collins, Colorado) long since have disappeared, or like *Burning Deck* (relocated from Durham, Connecticut to Providence, Rhode Island) reconstituted as small presses. Others possessed staying power, ascending to now national prominence, including along with *MR*, *Antioch Review*, *Crazyhorse*, *Southern Poetry Review*, *Shenandoah*, and *Hanging Loose*. Still somewhat politically stymied during its nascent existence, when Manhattan's Lower East Side Beat-poetry legend Ed Sanders applied for money for his *Fuck You: A Magazine of the Arts*, CCLM replied, "No—we can't give it to you," according to Chametzky.

At the time, the board's deliberations regarding funding concerned more than an individual publication's supposed aesthetic merit. An anecdote Chametzky tells about those days lends a point of reference to this subject. A short time after Nixon's first presidential victory, Michael Straight, a White House cultural liaison contacted CCLM, requesting a meeting

with its presiding officers. The Washington representative traveled to New York for the occasion, meeting Chametzky and others at a Spanish restaurant near the Chelsea Hotel. CCLM membership then stood above two hundred magazines, and the U.S. president was displeased with much of their content.

"You're getting all this money and they're all against the Vietnam War and Nixon. He's like a cornered rat—he can be very dangerous," the liaison warned the frontline of the literary avant-garde.

In narrating these events, Chametzky conceded that no visible consequences came of the implied threat. "It later came out that Straight had himself been a communist in the 30s in England," he speculated as to why CCLM kept its funding.

Also during the early Eighth Avenue years, as secretary Chametzky documents in his 1969 "Program Activities" report and according to my interview with him, under the leadership of William Phillips and Caroline Rand Herron, CCLM orchestrated and funded pilot projects that raised the visibility of the literary arts for decades afterwards. It set up its first on-location public library (a 26' x 21' room containing fifteen shelving units); established the College Contest Literary Magazine awards (now defunct); and formed relations with the Modern Language Association, exhibiting a selection of literary magazines at their annual national meeting. Additionally, the Council created a New York City reading series called "Poetry in the Park," which drew ethnically and economically diverse participation, including from under-privileged inner-city grade school children. With the help of the Poetry Center of the 92nd Street YM-YWHA, it sponsored evenings of discussions and readings with writers and magazine editors. CCLM also published the *Handbook of Literary Magazine and Business Production*, a model for CCLM/CLMP's latter-day annual *Directory of Literary Magazines and Presses*.

By 1972, the budget for CCLM had climbed to approximately $400,000. Pleased with its funding growth, the organization likewise was scrambling "to respond to the whole range of literary magazines, a remarkably diverse gathering in this country, and ... sought to keep factionalism and ideological biases out [its] judgments" when it came to re-granting and awarding prizes ("CCLM Biennial Report 1972/1973" 1–2). Along with lending support to established quarterlies, CCLM grew more receptive to "new magazines, new voices, new forms," its list of grantees bourgeoning to include the likes of *Aphra* (a feminist journal), *Fiction* (a tabloid publishing experimental stories), *Quetzal* (an American Indian magazine), *Gay Sunshine* (a homosexual tabloid literary journal), *Holy Beggars' Gazette* (a literary magazine exploring Hasidic teachings), and *Nkombo* (an African American magazine with ties to the Free Southern Theatre of Louisiana) (2).

"We were trying to be more democratic," Chametzky concurred about the changing nature of CCLM. "Every other meeting the board of directors tried to gather someplace outside of New York. Every time we went to one of these areas the little magazines would come out of the woodwork and accuse us of being New York elites." Infighting among the organization's leadership also was brewing. According to Chametzky's recollection, then *Antioch Review* editor Lawrence Grauman, slated to write a history of CCLM, called him "looking for the dirt." The *MR* editor further claimed, "He wrote and threatened me; the piece never got written." As the direction of the organization grew more diffuse, Chametzky resigned as secretary in 1972. "I also wanted to do more writing," he admitted.

CCLM did continue to grow through the 1970s, with federal funding in the form of a "block grant" from the NEA (the literary arts service's underwriter since inception), reaching nearly half a million dollars by 1980 ("CLMP Narrative" 1). "In 1980, CCLM began its first ongoing effort to diversify its funding base by seeking support from the private sector" ("Coordinating Council of Literary Magazines" 1). The move was perhaps more necessary than mercenary, since the Ronald Reagan presidential administration would in its early years yank the block grant away from the re-granters, pulling it back-in-house at the NEA ("CLMP Narrative" 1). Among private funding sources during the 80s, CCLM counted Exxon Corporation, the *New York Times*, the Mobil Foundation, and the Liz Claiborne Foundation. Likewise a prominent corporate sponsor, the General Electric Foundation established the G. E. Foundation Awards (1983–1989), a groundbreaking program offering direct support for young and emerging writers that has since become pro forma in the world of sponsored giving to the literary arts, as even a cursory glance at a recent issue of *Poets & Writers* assures. Over the life of the G. E. Foundation Awards, winners comprised a diverse group, including Natalie Kusz, Sigrid Nunez, Gregory Kolovakos, C. D. Wright, John Yau, Rita Dove, Julia Alvarez, Andrei Codrescu, Tama Janowitz, and Paul Hoover.

CCLM's services to literary magazines similarly shifted in focus, making inroads into the commercial world with projects to increase advertising in, and sales of, small magazines as a means of revenue. The organization itself meanwhile pitched for funds in a public way—for instance, by a placing an ad in *Newsweek* that listed the names of twenty-eight well-known modern authors above the plea: "The literary magazines that first published these great writers are going out of business. Unless you help."

Meanwhile, the squabbling Chametzky encountered within the organization during the early 70s had not necessarily abated a decade later. In fact, critics were circling in the late 70s and early 80s, generating what a file in the present-day CLMP archive labels "bad press" in commentaries with names like "Factions Divide Small-Press Movement," "Insidious Intermediaries," and "Perfidy." In 1979, Len Fulton, founder and editor of *International Directory of Magazines and Small Presses*, led the charge, accusing CCLM of self-interest and implying that founding quarterlies such as *MR* and *Partisan Review* were among its "five or six customers on five-figure twice-a-year grants" (3). A year later, Richard Kostelanetz wrote of serving as one of five elected judges to "participate in disbursing funds to literary magazines" and discovering "certain omissions" regarding applications (22). For his part, Nicholas Nyary, then executive director, conceded in a trade journal opinion piece that in its early days CCLM "appeared as a plausible agent" to the Nixon-Ford governments who funded it, "because it represented the East Coast, liberal, Anglo-Jewish literary establishment"; but he also asserted how, from the outset, "this leadership was contested by heirs of the Sixties"*(12)*. Still, Nyary pronounced the small press movement of the 80s "troubling," hoping the literary climate could survive the decade's "heavy bureaucratic hand"*(12)*.

According to CCLM's own record keeping (audited by Samuel Shedler, Certified Public Account), the year prior to Jules Chametzky's formal parting from the organization, "a total of 291 grants were made, ranging from $50 to $8,575" ("CCLM Biennial Report 1972/1973" 1). Between 1967 and 1984, it awarded over $3.4 million to more than 1500 different magazines, from larger, more established university quarterlies to small regional journals. But seven years after Fulton raised the issue of accountability for disbursal of funds, in 1986, CCLM would

in fact act "as fiscal agent for 18 magazines and literary projects for a total of $152, 461," according to information certified by its annual independent audit ("Coordinating Council of Literary Magazines" 5).

Change was inevitable at CCLM, including geographic relocation to a four-office, rent-free space at 666 Broadway, donated by *Harper's* magazine. In 1989, following an exhaustive search headed by then board member and *New Yorker* editor Alice Quinn, a Midwesterner named James Sitter joined the organization as executive director (Bergholz 1). CCLM was then at a crossroads. On his watch, the Coordinating Council of Literary Magazines would redirect its mission to advocate more broadly in the field of literary publishing, enlarging its membership to include independent presses and undergoing a name change in 1990 to the Council of Literary Magazines and Presses (CLMP). Sitter, a former director of the Minnesota Center for Book Arts who had many working-years experience in the industry as a book buyer, small-press distributor, and consultant, foresaw the 1990s as a "fertile time for independents" (Andrews 11). He moved to make consultants available on a subsidized basis to little magazines and small presses, recognizing the need to provide technical assistance to independents in the field as "crucial" in the coming decade (11). CLMP's newly affirmed mission was to help literary publishers, as well as to consider technological trends in publishing and small press distribution.

The reconstituted literary arts service later found a new home at 154 Christopher Street in the Chelsea district of Manhattan, still its base of operation today. CLMP headquarters fills a small office space, where young, hip, and unaffected staffers conduct business from within Dilbert-style cubicles, an office dog begging for bites of deli sandwiches underfoot. A terrific magazine rack—as vivid as any in a blockbuster bookstore—rests just inside the entrance door on the right, doubling as a display to promote the buying of CLMP magazines online *(shipping and handling paid by the literary arts service)*. Crowning jewel of the location, a modest library of archival and current publications by CLMP members occupies the freestanding, left-rear corner of the layout.

As if living out a certain fantasy of writers, critics, and others in the literary arts world, the CLMP staff has whittled the archive containing its organizational history down to half a filing cabinet drawer, letting the trail run cold at 1990, as I found on a visit to their offices in July of 2002. "Here are some newsletters," Jeffrey Lependorf, CLMP's current executive director offered me with a disarming smile, all of them dated from the past twelve months. By tracing the organization's textual transition from original typed, hand-corrected paper documents through to desktop published, fine-paper stock brochures, I would have to deduce a probable chronology of the CCLM/CLMP on my own. But first he would join me briefly at a long conference table in the library to chat about recent development at the nonprofit.

"Our goal is to get writing to readers," Lependorf, who hails from a classical music and literary arts consulting background told me, explaining that literature has special needs and special audiences differing from other kinds of publishing. "The reason why almost all new poetry is in the hands of independent publishers and not corning out of big houses is due to the simple fact that a poetry book will not sell as well as a self-help or cookbook." Consequently, providing technical assistance that demystifies processes between writers and publishers—mainly printing and distribution—is central to the organization's current mission of delivering literature to mass audiences.

Among visible innovations, CLMP has added on-line publishers to its membership base in an effort to support "New Media," including sound-image readable texts, e-books, and other electronic methods forgetting literature into print or circulation. A movement to extend the reach of the organization is likewise ongoing. "Why not make it an international community because of internet access? It's a way for our publishers to get their literature overseas, across borders, and vice versa," he enthused, acknowledging that multiethnic literature of the United States started in "little" literary magazines, an observation to which MR stands in testament. "There's a need for a diversity of voices," he continued, echoing the sentiments of CCLM co-founder Jules Chametzky but with a postmodern, global twist: The indie-publishing world, historically viewed as "alternative" when compared to negative-connoting "commercials," should now work in partnership with the economies of conventional publishing to engage new, worldwide audiences. "We now see this as an eco-system between large publishing and small," the executive director said. "It makes sense to go back and forth between the worlds. We're trying to broker more relationships, making this mutually beneficial. Some people are 'farmed out' to the big presses from the indie-media. It makes sense for people to have more books to read." Potentially broad-reaching authors, publishers, and titles served by the organization roll off his tongue nonstop. Recognizing the reigning zeitgeist, he held up a literary journal called *One Story*, its eponymous contents a selection entitled "Sensitivity" by fiction writer Todd Pruzan—the very same volume later profiled and pictured in a publishing brief printed in the October 14, 2002 issue of *Newsweek*.

Making his exit, for the remainder of the afternoon the director obligingly lent me the privacy of the on-site library, where I sat surrounded by recent issues of the two hundred-plus member magazines to which the organization subscribes and dozens of current literature volumes published by small-press members. (Aging books and journals periodically are passed along to the New York Public Library to make way for the new.) A writer could spend hours among CLMP's collection, browsing and reading in the narrow room circled by framed poetry broadsides. As I rose to admire the offerings, *West Branch*, *The Reading Room*, *Barrow Street*, *3rd Bed*, *Poetry*, *Calyx*, *Fence*, and *Rattapallax* all caught my eye. I dawdled over Laurie Foo's *Bingo Under the Crucifix* (2002), a collection of pop stories inspired by tabloid headlines from the likes of People magazine and published by Coffee House Press of Minneapolis. Finally, I stood before a neat row of little magazines with The Massachusetts Review printed along the spines, glad for the hand that Jules Chametzky had in securing their station on the shelf.

CHAPTER 11

Promising Prospects, and the Hurdles Along the Way: Sharing and Archiving Community Media Content Online

Joost van Beek

In *Transnationalizing Radio Research: New Approaches to an Old Medium*, edited by Golo Föllmer and Alexander Badenoch, 223–30. Transcript, 2018.

Community media, most pithily defined as broadcasting "for, by and about the community" (UNESCO 2001), produce an extraordinary range of politically, culturally and artistically valuable and topical content. Defined by a mission to serve and represent communities rather than generate profit, independence from commercial and governmental interests, and a participatory, volunteer-driven model (Coyer/van Beek 2010: 136–138), they have in particular demonstrated an "extensive and sustained" engagement with migrant groups through (often minority-language or bilingual) community programming as well as programs with an explicitly intercultural or anti-racist focus. (Titley 2010: 141–145) Given its focus on community building and bottom-up production models, this media sector should in theory benefit especially from the increased availability of interactive digital platforms for sharing and archiving content. Since on-air broadcasting is an inherently evanescent medium, digital archives can play a key complementary role in preserving and sharing the stories that are told on community media.

BY-NC-ND

Even if the impact of community media is by intention primarily local, online access to their content can also expand opportunities for (intercultural) dialogue both regionally or nationally and in diaspora communities. In reality, online publishing practices unfortunately remain patchy, as do efforts to operate communal, networked archives. Consequently, programming that could make valuable contributions to broader cultural and socio-political conversations has remained underutilized.

In this chapter, I will draw on the findings of the EU-funded project *CAPTCHA—Creative Approaches to Living Cultural Archives* (2013–2015, http://livingar-chives.eu/), in which we explored community media archiving practices across Europe, and the study conducted during the project (van Beek 2016), in order to identify best practices for preserving and sharing content online and the challenges standing in the way.

The Promise of Networked Archives

While community media audiences can develop an especially personal or loyal bond with the station through its opportunities for active participation or its focus on grassroots concerns, their expectations have changed in line with the ever-expanding scope of streaming and on-demand content. As *Radio Orange*'s Jan Hestmann warned, people want to be able to listen to "what they're interested in, [..] wherever and whenever they want." (ibid: 9)

In our study we found that community media often struggle to keep up with this sea change in media use. Many are slow to embrace a transformation of what 'making radio' means—from solely producing on-air broadcasts to publishing media content in a variety of formats and interacting with listeners across different platforms. They are constrained mostly by lacking financial and organizational resources, but a cultural disconnect between the realms of radio and online plays a role as well. Those constraints also affect their capacity to not just maintain in-house archives, but ensure their public or online accessibility. All too often, legacies that represent not only a particular station's history but that of whole communities are, as the Broadcasting Authority of Ireland's Anne O'Brien warned, "at risk of being lost forever." *(ibid: 9)*

In this light, online initiatives to exchange and archive programming on joint public platforms like the Spanish/Latin-American Red Nosotras en el Mundo (http://www.rednosotrasenelmundo.org/) play an especially valuable role, but they also face oversized challenges. The examples of EPRA *(Échanges et Productions Radiophoniques)*, which once presented 11,000 hours of French community media content; Cross Radio, which involved radio stations from across former Yugoslavia; the program exchange platform of Ireland's Community Radio Forum; and the Belgian community media database RadioSwap illustrate how they are often confronted with fatal hurdles, falling victim to funding short-falls, technical failures, or lacking organizational capacity.

Nevertheless, Austria's Cultural Broadcasting Archive *(CBA* https://cba.fro. at/) and Germany's Freie-Radios.net, hosting over 80,000 audio files each, have grown well beyond program-sharing tools of the community media federations that support them, into collaborative archives which present a rich documentation of contemporary history. Crucially, they have helped broadcasters publish content online, and highlight or integrate it on their own sites, even when they lack the resources to create their own archiving structures. Most

stations only upload a selection of their broadcasts to them, however. Moreover, they seem designed primarily to serve the needs of participating broadcasters, rather than to provide listeners at large with user-friendly interfaces to browse and search the wealth of community media content they offer (van Beek 2016: 88–2).

Reasons to Excel

In principle, community media should be particularly motivated to ensure the preservation of their content and excellently positioned to optimize online interaction with it. After all, each of the defining strengths of community media finds its parallel potential online.

Community media spring from the same groundswell of DIY culture, in which people claim "the right to be heard rather than be spoken to," as the "acts of […] independent, collaborative or participatory media-making" which have flourished especially online (Deuze 2006: 267, 273). Their participatory ethos, which identifies citizen-producers rather than passive consumers, overlaps with that of citizen journalism (Bosch 2013: 29), e.g. at similarly volunteer- and mission-driven hyperlocal news sites. (Williams 2016) Social media can help them fulfill their key mandate "of engaging with audiences in participatory ways, and allowing audience members to determine content through collaborative journalism." (Bosch 2013: 37)

Community media provide "artists and creative entrepreneurs [with] a platform for testing new ideas and […] content that cannot be conveyed in the mass media" (European Parliament 2007: 9). Austrian Dorf TV, which cofounder Otto Tremetzberger called "a hybrid of TV and Internet," showcases how embracing the online recruitment, development and archiving of "user-generated television" can provide them with a complementary medium. Instead of trying to pull a spatially dispersed community of producers into in-house production structures and set broadcasting times, its portal allows them to store, work and interact on their videos remotely as well.

Community media capture unique content that is "intrinsically interwoven with the lives of local community members" (Raveendran 2016) and gives voice to grassroots communities that are underrepresented in mainstream media and institutions. Theirs are the memories that are most vulnerable to being lost. Archiving this content "will ensure the voice of the 'ordinary' people will be recorded and available for future generations" when "the majority of mainstream archives […] tend to be the voices of those in power and authority" (Loughran 2015). Otherwise, Jörg Depta of Berlin's Pi-Radio warned, "while the public service broadcasters enjoy the luxury of having their own archive at the German Broadcasting Archive, nothing will be left for historians […] from the 'free radio stations' and their predecessors, the pirate stations" (van Beek 2016: 9–10).

Community media help "strengthen the identities of specific communities of interest" (European Parliament 2007: 6), presenting locations of cultural encounters as well as platforms for "the participation and emancipation process" of minority groups (Online/More Colour in the Media 2004). Archiving presents a key tool for protecting cultural heritage, and interactively publishing content online presents an opportunity to rouse engagement with minority cultures across geographic, community and generational boundaries. Online community broadcaster Radio Kultura, for example, addresses a diasporic Basque audience as well as a bicultural local audience of French and Basque listeners.

Greater use of on-demand and social media, already home to virtual communities that play an especially important role as "spaces for identity, expression and participation" for diasporic populations (Georgiou 2013: 84), could expand the parameters of community media to become "a cosmopolitan space of cultural netizens," geographically fragmented but symbolically connected (Nassanga/Manyozo/Lopes 2013: 259). On the site of one rural Irish community station, a remote listener commented to say: "Can't wait to go back home to Connemara. Listen to you guys every night. Helps me get to sleep. You're keeping me going until I can move back" (van Beek 2016:116).

Sobering Reality

In short, community media should be "well equipped to take on" the challenges of digital platforms: "they are grounded in an experimental ethos" in using technology and "cater for specific […] interests but also connect communities across boundaries and distances" (Hallett/Hintz 2010: 159). And yet, the publication, distribution and archiving of content online is a scattershot affair, often lacking an overarching digital strategy (Leindecker 2015: 14). Many smaller broadcasters are yet to advance beyond "simulcasting […] web and FM transmissions" which was already "increasingly common" a decade ago (Lewis 2008: 25). Others only embed some selection of audio content in playlists, blog posts or news items, with at most few and inconsistently applied metadata. Sometimes, more structured archives exist only for specific programs or initiatives; a fragmented practice which is exacerbated by having to rely on short-term, project-specific funding opportunities.

A review of community radio stations in Germany's umbrella association BFR revealed that only one in five offered ways "to access (posts with) past audio content by theme or topic" and "just under one in four allowed listeners to navigate to past audio content by day, week or month" (van Beek 2014). The rates were even lower among Spanish community media. Endeavors to highlight, structure and contextualize archival content in interactive or narrative ways that would ensure its discoverability in the long term (Leindecker 2015: 15) remained a remote prospect.

Online archiving efforts have often depended on the work of lone, passionate individuals, who might be increasingly challenged by ever more complex technologies. Switzerland's Radio LoRa has been uploading its full program since 2002 thanks to the pioneering work of Christoph Lindenmaier, whom his colleagues described as "a genius, [who] made everything himself" (van Beek 2016: 53). But its system has remained essentially unchanged since then, meaning you now need auxiliary software to listen to archived broadcasts, since they are still being uploaded as Real Media files.

Our study found relatively few examples of collaborations with comparably grassroots, activist communities of online developers, and hardly any recruitment efforts that targeted potential volunteers with a primary interest in web or tech rather than on-air radio. Spain's CUAC FM, where software engineers volunteered to develop a mobile app and an open-source system to automatically record and archive broadcast content, demonstrates the benefits of doing so. [1]

[1] See https://cuacfm.org/novas/2017/02/nova-version-da-app-android/ and http://radioco.org/en/about/.

The extent to which content is archived in-house varies too. While Slovenia's Radio Študent maintains an internal archive with 40 thousand objects, an interviewee at one radio station confessed that "we have a few cartons of stuff, but that's basically our archive". Current broadcasts now seem to be universally recorded and stored, but if this content is not labelled and organized its accessible preservation is still under threat.

Much historical material may have "scattered" and only survive "in a drawer, in the attic" of former volunteers or listeners (Brunow 2015: 9). On the bright side, the capacity of community media to cultivate active volunteer and sympathizer communities means this is an opportunity as much as it is a danger. At Radio Dreyeckland, former volunteers return to digitize the programs they themselves made. Radio Študent "crowdsourced" the station's historical record in an experiment it dubbed 'on-air ethnography', and even reconstructed its first ever broadcast.

What's Holding Them Back?

Essentially, it remains true that "the sector lacks the skills, resources and notably the regulatory support" to fully utilize the digital media environment (European Parliament 2007: 51). In addition to scarce funding opportunities, the main challenges community media face relate to copyright, volunteers, conflicting objectives, and data capacity and security.

When legal rights issues hinder the web archiving efforts of much larger institutions (Sierman/Teszelszky 2017), it is no surprise that community media wrestle with them. Specifically, copyright regulations that preclude or limit the online publication of musical content played a major role in discouraging most every station to some extent from uploading content—not just music programs, but mixed-content journalistic broadcasts as well. Only concerted, sustained advocacy can offer long-term relief. When Austrian community radio stations succeeded, after years of negotiations, in concluding a ground-breaking three-year collective agreement with collecting societies (Neuwirth 2014), CBA contributors uploaded over 500 files in a single day.

Community broadcasters rely on volunteers who are eager to learn and motivated by a sense of idealism. But this also means they can't necessarily be obliged to take on the additional tasks of uploading and categorizing their content, and stations have to rely on persuasion. High turnover and divergent levels of digital literacy of volunteers, many of whom might be from disadvantaged communities, affect the consistency of archiving and the quality of metadata. Centralizing the process is often unfeasible, not least with multilingual programming, so community media must continuously invest in training and guidance.

Contradictory use cases hamper the discoverability of archived content. Community radio websites, focused on helping regular listeners catch up with specific programs, tend to replicate on-air structures: hour-long units, fitted into archives by date and/or program that have frequently mushroomed into complex content trees which mix audio and non-audio content. But a new generation of (mobile) online-only listeners might not recognize program names or care about when something was broadcast. Consistent use of tags to identify subjects and genres as well as design shortcuts to highlight where audio content is available serve to mitigate this dilemma to some extent. But stations increasingly face a choice between maintaining intricate but cumbersome parallel navigation structures, as German

community broadcaster Radio Dreyeck-land did, and making a strategic decision to focus structures primarily on the online-only visitor, as Belfast's Northern Visions seemed to do when establishing a stand-alone archive site (van Beek 2014: 81–83).

The "digital archive needs active and constant care"; truly safeguarding long-term preservation involves not just multiple backups but regularly checking their integrity and migrating them whenever formats and carriers become obsolete (Pop 2015: 50). This is a daunting prospect for most community broadcasters. Stories about significant amounts of content being lost when servers failed or websites were overhauled or migrated were disturbingly frequent.

Lacking the resources to build online archiving structures, many broadcasters understandably rely on commercial third party services. Without their free accounts on Soundcloud, Mixcloud, iVoox and Vimeo, a vast span of community broadcast content would never find its way online. But delegating the online accessibility of their content makes broadcasters dependent on companies which can change or restrict access, features and pricing at will, or fail altogether and take entire archives down with them, while conceding those companies legal control and financial profit over their content.

If community broadcasters are to "maintain the relevance" of their media-political principles, they need to carve out autonomous, pluralist spaces in the digital media landscape the same way they did on the radio waves (Leindecker 2015: 13–14). That means doing it the hard way, building and utilizing non-commercial, open-access and open-source tools and infrastructures which they alone control, and can expand and customize at will. Doing so requires reaching out more to open source communities, recruiting primarily IT/web-focused staff or volunteers (as Radio Študent and CUAC FM did), partnering with local tech companies with similar values (as Germany's Radio Wüste Welle did), developing open source software that could also meet the needs of other community broadcasters (as Pi Radio did with metadata management tool "calcms"), and creating avenues for stations to pass on lessons learnt (as the CAPTCHA project aimed to do). Stronger national community media organizations would make the effort considerably more feasible. While networked efforts by German stations to build a "Freie Radio App" appear to have faltered, the CBA remains an excellent example of a joint initiative that, more than just creating a shared archive, provides even modestly sized stations with tools to publish program content on their own sites. In all, a formidable challenge indeed; but community radio was itself born of a struggle that achieved improbable success against daunting odds.

PART 3

Policy, Regulations, and Government Intervention

CHAPTER 12

Media at the Margins: Policy and Practice in American, Canadian, and British Community Television

Christopher Ali

International Journal of Communication 6 (2012): 1119–36.

Abstract

This comparative study addresses the policies and practices of community television in the United States, United Kingdom, and Canada. In particular, I examine how community media organizations are transforming themselves to meet the demands of a digital world, and how these experiences are reflected in policy and regulation. Findings suggest that the policies governing community television do not correspond to what has been experienced by practitioners. Drawing from theories of the public sphere, the argument is made that policy does a disservice to community television by failing to acknowledge the importance of place, bodies, and practice. This is problematic, as it fails to distinguish community media from user-generated digital content.

Recent years have witnessed a tremendous degree of campaigning by community media organizations in Canada, the UK, and the United States. In Canada, January 2010 saw the Canadian Association of Community Television Users and Stations (CACTUS) launch a nation-wide campaign to "put community back in community TV," in anticipation of a

BY-NC-ND

review of community television by the Canadian Radio-Television and Telecommunications Commission (CRTC; Edwards, 2010). In the UK, the Community Media Association continues to lobby the BBC and the Office of Communications (OfCom) to recognize the value of community media. In the United States, 2009 represented a watershed moment, when Philadelphia witnessed the launch of its first community television station, ending a 27-year struggle for public access television in that city.

Community media are neglected aspects of our media landscape that represent the public's only opportunity to use the infrastructure of mainstream media to produce and disseminate their own content and voices (Howley, 2005; Rodriguez, 2001). With the advent of user-generated digital media, however, the relevance of *community television* is being questioned; it is accused of becoming an anachronism in today's contemporary mediascape (see Fuentes-Bautista, 2009; Timescape, 2009; Waldman, 2011). The anecdotes above illustrate an attempt to engage in this debate. Moreover, they join a conversation lamenting community television's position at the margins of our local, national, and global mediascape (Howley, 2005; Rennie, 2006). They suggest community television continues to be both a "living organism," and a site of contestation—an ongoing struggle over place, agency, representation, and identity (Rodriguez, 2001, p. 158). These areas of contestation find their fulcra in the four intersecting nodes of *policy, practice, publics*, and *place*, and it is within these spheres that this research is situated. This research seeks to address the experiences and challenges of community television in the United States, Canada, and the UK.[1] More specifically, this research asks the questions: How are these experiences reflected in regulation? And, how do these policies and practices compare across national boundaries, particularly when discussing digital media? Such questions take on new urgency as concern grows over the potential loss of diversity of voices brought on by corporate convergence (McChesney, 1999). This study is based on 10 in-depth interviews with community television practitioners, organizers, and advocates in Canada, the United States, and the UK. Given that the focus of this paper is on the intersection of practice and policy, these interviews were compared against a review of recent regulatory initiatives from the CRTC, FCC, and OfCom. These three countries, moreover, were not chosen randomly, but rather, because they are nations with advanced communications systems, and perhaps more important, because they share a regulatory commitment to serving that mercurial notion called "the public interest."[2]

This comparison reveals a bifurcation whereby the policies governing community television do not correspond to what has been experienced by practitioners and advocates. While the practitioners I interviewed emphasized experience, practice, and physical place as salient attributes of community television, policies tend to internalize the value of community television as residing exclusively in *content*, and not in the places or publics formed in the creation of this content. I do not seek to refute this position. Giving voice to the voiceless is crucial in a mediascape dominated by hegemonic capitalist interests (Howley, 2005; Rodriguez, 2001). Nevertheless, content does not represent the total value of community television or community media more broadly. In contrast, findings suggest that the strength of community

[1] I use "community television" to delineate the scope of this research. On occasion, "community media" is used to discuss the larger field or community media centers and organizations.

[2] The U.S. Telecommunications Act of 1996, the 1991 Canadian Broadcasting Act, and the UK Communications Act 2003 all reference broadcasting in the public interest.

television lies, in part, in its relationship to physical *place* (Howley, 2010, p. 9)—that is to say, in its ability to bring community members together in time and space for the purposes of education, deliberation, networking, community building, and of course, media production. Put another way, the benefits of community television reside not only in its content, but in its practices. While ignored by policymakers, this is not a new observation. King and Mele, for instance, noted in 1999 how a rhetorical devotion to community television's contributions to the deliberative ideation of the public sphere, "focus[es] too narrowly on the content of such programs and discount[s] critical possibilities inherent in the production of public access television," (1999, p. 607). What sets this study apart is the addition of a critique of policy, as well as its expansion from the microcosm of one organization to a comparison of practice and policy among nation-states.

Policy has long centered on community television's ability to foster freedom of expression and contribution to deliberation in our democracy. In doing so, it has created a discursive "community media public" based solely around content. Through this lens, community television has been called an "electronic public space" (Aufderheide, 1996) or an "electronic soap box" (Linder, 1999; United States, 1984a, p. 4667)—a vehicle for citizens to discuss, share, and deliberate matters most important to them. While praiseworthy, such a myopic reliance on content reduces community television purely to output. Policy rhetoric rests on the normative assumption that equates the value of community television with a disembodied, Habermasean public sphere (1974) at the expense of the corporeal, the experiential, and the practical. This is problematic, as it fails to distinguish community media from YouTube or any other user-generated digital platform. This perspective needs to be expanded to understand the totality of values and strengths engendered within these media practices, and I suggest that policy does a disservice to community television by failing to acknowledge the importance of place, bodies, and practice. This critique of regulatory obliqueness and the disembodied public sphere of community television policy is framed through the discussion of three themes. Drawing from Castells' (2000, pp. 18–20) and Giddens' (1991, p. 18) differentiation between "place" (territorially bounded localities) and "space" (dislocated and disembodied relationships), these themes are labeled: *place*, *space*, and *interface*. *Place* refers to the community, locality, and physical presence of community television organizations. *Space* refers to the relationships between community television and dominant institutions. Here, I discuss the difficulties in creating spaces and publics of attention and recognition. *Interface* refers to the changing nature of the relationship between community television and technology, particularly as organizations struggle with the adoption of digital media.

Community Television/Community Media

Scholarship on community media has been on the rise in recent years, with a number of conferences, journals, and manuscripts devoted to the topic (Jankowski, 2003). While positive, such a resurgence suggests there is still much to be learned. This could stem from the observation that community media is amorphous, as the practices are globally dispersed and locally situated, and also incorporate any combination of media and people (Rennie, 2006). Studies, for example, have focused on community radio, television, and newsletters in North America (Howley, 2005; King & Mele, 1999; Linder, 1999); community television and radio

in Australia (Rennie, 2006); Latino/a radio in the United States; community reporting in Nicaragua; video production among Columbian women (Rodriguez, 2001); and radio among Bolivian tin miners (Huesca, 1995). Such examples demonstrate that, while a central tenet of community media is its situatedness, it is not exclusive to any global milieu, or reliant on any one medium. Community media is what the community needs it to be. The most challenging aspect is definitional (Rennie, 2006, p. 22). Rodriguez, for instance, argues that we need to abandon the label "community media" (or "alternative media") and assume the moniker of "citizens' media," as it better embodies the qualities of collectivity, "contesting social codes," and empowerment (2001, p. 20). Adding to this difficulty is the observation that community media is not a stable, complete, or hermetic system. It is amorphous, mercurial, and more often than not, ephemeral (ibid.). Out of the myriad definitions posited (see Buckley et al., 2008, p. 206; Lewis & Booth, 1989, p. 9; Rennie, 2006, p. 4; Rodriguez, 2001), the most comprehensive comes from Howley, who defines community media as:

> Grassroots or locally oriented media access initiatives predicated on a profound sense of dissatisfaction with mainstream media form and content, dedicated to the principles of free expression and participatory democracy, and committed to enhancing community relations and promoting community solidarity. (2005, p. 2)

This highlights the fundamental characteristics of community media as suggested by Nossek: *participation*, *access*, and *self-management* (2003, p. 308). As this research suggests, *location* or *place* is yet another salient attribute. Howley, for instance, notes how reports of the obsolescence of place and community within the discourse of globalization have been greatly exaggerated (2010, p. 8). In contrast, he argues that "place still has enormous relevance to human experience," and that community media become the locus where the "relationship between place and identity" can be experienced (ibid., p. 9). All of this is to say that community media is intricately tied to the notion of place, and that this "sense of place" remains a seminal aspect of the human condition (ibid.).

What these disparate elements then point to is an understanding of community media as being less about content than about modes of production (King & Mele, 1999). This process-oriented approach has much in common with Couldry's (2004) call for a "media as practice" approach to communications research. Couldry seeks to "treat[] media as the open set of practices relating to, or oriented around, media," (ibid., p. 117). In doing so, this approach "decentre[s] media research from the study of media texts or production structures (important though these are) and . . . redirect[s] it onto the study of open-ended range of practices focused directly or indirectly on media," (ibid.). This notion of media practice is adaptable to a study of community media, as it lends credence to the argument that the physical locale of community media is often regarded as one of relationship building and empowerment, rather than simply content production (Higgins, 1999; Howley, 2005; Rodriguez, 2001). Indeed, it is an example of what "people [are] *doing* in relation to media across a whole range of situations and contexts" (Couldry, 2004, p. 119).

There is disagreement, however, as to the next phase for academic inquiry. Rennie argues that a policy approach is needed, so as to "get away from notions of community media as something resistant to government and the economy" (2006, p. 6). Conversely, Jankowski argues for the need to supplement policy analysis—something he sees as existing in abun-

dance—with theoretical and empirical model building (2003, p. 10). In agreement with Rennie, however, my research has also observed a paucity of critical scholarship on community media policy (see also Howley, 2010). Two further gaps appear in our knowledge of community media. First, scholars such as Rodriguez (2001), Howley (2005), and Huesca (1995) remind us power does not exist in binary—those with and those without. Rather, we need to move away from this reductionist notion and see it more along a spectrum. The authors intimate the need for a more nuanced hermeneutic of community media and power. Second, while we are confronted with a number of insightful case studies, and derived from them, a number of theoretical explanations championing the importance of community media as a democratic process, few studies have used these case studies to compare community media at the level of the nation-state. What I suggest is an alternative path scholars could follow to continue expanding our knowledge of community media—one that merges Rennie's (2006) assertion for policy critique, and Jankowski's (2003) argument for mid-level, empirical, and theoretical model-building. I accomplish this through presenting a critique of policy and putting forward an empirically-based argument centered around the concepts of place, practice, and publics.

Policies and Publics

Despite Canada, the United States, and the UK having distinctive media systems, *community television* generally follows the same framework. That is to say, a public access model, whereby community members are able to produce and broadcast their own programs using equipment and training provided by the station. The majority of community television stations in Canada and the United States are distributed through cable systems, while in the UK, where cable penetration is relatively low, organizations have either been able to secure a coveted terrestrial broadcast license ("Restricted Service License") or take advantage of Internet broadcasting (Timescape, 2009).

The United States is perhaps most infamous with respect to public access television—a country where free expression takes precedent, where community television stations are first-come-first-served, and where the popular film *Wayne's World* holds key representational space. While there has yet to be a census of public access stations, recent estimates place the number at around 3,000—making them rather ubiquitous entities among American communities (Goldfarb, 2008, p. 1). Traditionally, public access has been regulated at the municipal level, where the municipality grants a franchise to a cable operator in exchange for certain benefits—such as public, educational, and governmental ("PEG") access channels. Non-profit organizations, municipalities, or cable operators typically run these channels. Public channels stand for open public access, educational channels tend to air lectures and classes, and government channels air city council meetings and other government information—although these boundaries are often blurred (Linder, 1999, p. xxv). Surprisingly, the United States lacks a coherent community television policy. Rather, community television regulation is dispersed amongst a myriad of congressional legislation and FCC regulations, most of which generally address the distribution of cable systems.[3] Like much policy in the United States, community television has also been shaped by a number of Supreme Court cases (i.e., *Denver Area v. FCC*, 1996). These discrete rulings and regulations typically focus

[3] See United States, 1984b, 1992, 1996; FCC, 2006, 2007.

on elements such as franchise fees, rollout, and in the case of the 1992 Cable Act, content regulation and First Amendment implications (as was argued in *Denver Area v. FCC*). There has been little discussion of place, physicality, or publics. Rather, recent policy tends to follow the trajectory laid out in a congressional report on the 1984 Cable Act:

> A requirement of reasonable third-party access to cable systems will mean a wide diversity of information sources for the public—the fundamental goal of the First Amendment—without the need to regulate the content of programming provided over cable. . . . Public access channels are often the video equivalent of the speaker's soapbox or the electronic parallel to the printed leaflet. They provide groups and individuals who generally have not had access to the electronic media with the opportunity to become sources of information in the electronic marketplace of ideas. (United States, 1984a, p. 4667)

Note here the reliance on the tropes of the First Amendment, orality, and the marketplace of ideas—which connote content and dissemination, but focus little on modes or practices of production (King & Mele, 1999).

The more recent issue of statewide franchising has further pushed policy toward a disembodied space. Finding strong support in the lobbying efforts of telecommunication providers amongst state legislatures, this provision "allows new providers (i.e., phone companies such as AT&T and Verizon) to bypass municipal franchises and apply for a statewide franchise permit," (Goldfarb, 2008, p. 5). Distancing franchise authority from the municipality allows these companies to usurp local authority, avoid individual franchise fees, and leave many PEG organizations without sustainable funding. Despite vehement protest by PEG advocates, over 20 states have enacted such legislation, resulting in the reported closure of dozens stations, and the reduction of services at dozens more (Goldfarb, 2008, pp.5–8; Linder & Kenton, 2010, p. 12; Waldman, 2011, p. 300, quoting reports by American Community Media). Statewide franchising is thus a further example of the *lacuna* between the practices, policies, and places of community television.

Canadian community television policy is much more explicit than U.S. policy, having been enshrined as one of three components of the Canadian broadcasting system (in addition to private and public broadcasting) in the 1991 *Broadcasting Act* (Canada, 1991, §3.1.b.). This provides the CRTC latitude to regulate the service as it sees fit. Once the birthplace of community television (Howley, 2005, p. 52), Canada's community television greatly resembled its American counterpart (cable-based, privileging access and participation) until 1997, when deregulation permitted cable operators to eliminate public participation and consolidate stations (Timescape, 2009). To correct this imbalance, recent years have witnessed a plethora of regulatory interventions in community television.[4] For instance, in 2002 and again in 2010, the CRTC reversed many of these destructive allotments. In particular, the 2002 decision mandated for the first time, a quota for programming produced by members of the public (rather than cable employees) (CRTC, 2002, para. 55; CRTC, 2010, para. 10). This quota was set at 30% of weekly programming for community channels run by cable companies in 2002, and was increased to 50% in a subsequent 2010 decision to become effective in 2014 (CRTC, 2010, para. 10). Nevertheless, the focus remains on the creation and dissemination of content, rather than the provision of places for production and gathering. For instance, it was noted

[4] See CRTC, 2002, 2009, 2010.

in 2002 and reaffirmed in 2010 that the main objectives of community television are to "ensure the creation and exhibition of more locally produced, locally reflective community programming; and to foster a great diversity of voices and alternative choices by facilitating new entrants at the local level" (CRTC, 2010, p. xiii).

There are, of course, exceptions to this generalization. For instance, the 2010 *Community Television Policy* encourages licensees of community-based television to, "Facilitate citizen access to the production of programming, and, provide training to those within the community wishing to participate in the production of programming" (ibid.). Despite this, we continue to see a favoring of content over practices in Canadian community television regulation. That is to say, we see a focus on the disembodied voice of the participant, rather than any concern for the democratic value of the practice and place of community television.

While possessing a much weaker community television system than Canada and the United States, regulators and legislators in the UK have begun to acknowledge the participatory value of community media. This, for instance, is demonstrated by the inclusion of community broadcasting in the 2003 *Communications Act* (Timescape, 2009; UK, 2003, §262, 359). Nevertheless, the landscape of community television remains bleak. Many explanations have been given for the lack of local and community television, including the failure of cable to take hold, a lack of funding, and the failure of the licensing regime (OfCom, 2009, pp. 104, 128; Timescape, 2009). The future is thus uncertain for community television, with only four restricted service license (RSL) holders in operation as of 2009 (compared with 3,000+ community stations in the United States and 139 in Canada; CRTC, 2009; OfCom, 2009, p. 21; Timescape, 2009). Of these four stations, moreover, only Belfast's NvTv is predicated upon notions of public access (OfCom, 2009, p. 37; Timescape, 2009).[5] The challenges for all organizations remain securing the necessities of survival: favorable regulation and funding (Timescape, 2009). It has been suggested, therefore, that one should look to community radio for indices of potential regulation for television (OfCom, 2009). For instance, OfCom noted:

> In addition providing unique content, community radio stations deliver wide benefits to people in the areas in which they broadcast. This includes offering training and work experience opportunities, contributions to local education and providing a voice to those, such as older people or speakers of minority languages, who may find it harder to access the media. (2010, sec. 2.2)

While the democratic value of community radio in the UK is acknowledged, community television still remains nascent, if not stillborn. That said, a recent OfCom report noted community media (or "ultra-local media") has the potential to:

> Deliver media literacy in a range of forms, including content creation, critical appreciation, public service announcements, the skills to interrogate public data in order to make better-informed decisions about where—and how—to live, and the ability to hold local public bodies more effectively to account. (2009, pp. 127–128)

Unlike Canada and the United States, the challenge in the UK is how to operationalize this support. As was previously noted, infrastructure remains a barrier; hence we have witnessed a number of community television organizations transition or start-up online, to accommodate the "low overhead" costs of operating placelessly (Timescape, 2009). This dislocated form of

[5] An unlicensed community station (Channel 7) is also operating through cable in Immingham (Timescape, 2009; OfCom, 2009, p. 43)

community television, however, may not take full advantage of the embodied opportunities presented by community radio. For the moment, all three countries face challenges with respect to place and bodies in their respective policy and regulatory decisions. That places, practices, and embodied publics are not acknowledged does, indeed, suggest that community television is no different from any user-generated digital platform. This could then lead to further calls for defunding or increased barriers to access and infrastructure capital.

Publics and Practices

What these aforementioned policies do reflect is a Habermasean public sphere (Habermas, 1974). That is, one where voice, deliberation, and ideological space for discussion are privileged at the expense of place, practice, and bodies. In his formidable work, Habermas envisions the bourgeois public sphere as that which mediates the spheres of society and state (ibid., p. 50). That is to say, a group of citizens (i.e., bourgeois, white, male) coming together to discuss "objects connected to the activity of the state," (ibid., p. 49). Discussion is the operative word here, as for Habermas, "a portion of the public sphere comes into being in every conversation in which private individuals assemble to form a public body," (ibid.). In Kulynych's words, the Habermasean public sphere equates democracy with participation, and participation as "discursive participation; it is communication governed by rational, communicatively achieved argument and negotiation," (1997, p. 320). Physical presence in a "concrete locale" is unnecessary for such active participation in, and contribution to, the public sphere (ibid., p. 322). While Habermas notes that such discussions often took place in the salons or cafés of 18th- and 19th-century European capitals, many have critiqued Habermas for his failure to recognize the importance of place and bodies (Kohn, 2000; Kulynych, 1997; Warner, 1993). Warner argues that this conceptualization of the public sphere permitted self-abstraction of only the privileged elite, leaving minorities and the underprivileged embodied, but voiceless (1993, p. 240). While it is argued that user-generated media rectify such imbalance between the powerful and the powerless (Bruns, 2008), what separates community television from this cacophony is not only the addition of voices to the marketplace of ideas, but rather its practices, places, and publics (see Aufderheide, 1996, p. 127).

To be sure, there is nothing wrong with deliberation, only that its articulation as the *sine qua non* of democracy is incomplete (Kohn 2000; Schudson, 1997). Kohn, for one, argues that deliberative democracy invites participation only from the elite, and as such, abstracts minority voices (2000, p. 426). It is not only that discussion reigns supreme in the disembodied public sphere, but that the notion of place is often rendered irrelevant. Policy mimics such an approach, granting salience to content, but not practice. In contrast, community television is able to encourage equal participation, or as King and Mele observe, the "different *experiences of production* [are] both meaningful to the individual volunteers and important to the constitution of the public sphere" (1999, p. 621). This closely resembles Friedland's conceptualization of a "communicatively integrated community," where the interactions of place (community), participation, deliberation, and communication (media) are seen as necessary components of a functioning democracy (2001, p. 359).

Paralleling this debate, content—a disembodied voice in the airwaves—is an insufficient descriptor for community television. Without the recognition of practice and place, com-

munity television policy has created what Turner has called a "demotic" public. That is to say, "There is not necessary connection between, on the one hand, a broadening demographic in the pattern of access to media representation and, on the other hand, a democratic politics" (2010, p. 17). Without acknowledging a connection to place, community television is seen, through the lens of policy, as another contributor to an unending stream of voices, devoid of the empowerment capabilities highlighted by scholars (Higgins, 1999; King & Mele, 1999). Invoking another critic, policy has created what Fraser calls a "weak public"—deliberative, but unable to operationalize (1992, p. 134). Rather, in the bringing together of people in space and time, community television forms "strong publics"—"publics whose discourse encompasses both opinion formation and decision making," (ibid., p. 143). While such decision-making is localized at the community level, it nonetheless grants a certain degree of agency to community media organizations.

To recap, I have analyzed relevant community television regulation and legislation in the United States, Canada, and the UK, and found them wanting. More specifically, I argue that they fail to incorporate the salient aspects of place and the "experience of media production," favoring instead the end result—the product, the program, the content (King & Mele, 1999, p. 614). I argue that policy needs to conceive of community television in a more holistic fashion, taking into account the notions of publics, practices, and places. The following sections underscore this argument, using evidence from interviews with community television practitioners, advocates, and organizers.

Place

Of primary importance is the notion of place, and respondents advocated strongly for the situatedness of their community media practices. Situatedness here refers to both the physical infrastructure of the organization and the notion that public participation itself is a seminal characteristic. Public participation was called by one interviewee the "lifeblood" of community television, and the "cornerstone of the access system," suggesting the importance of this quality (personal communication, 11/9/10). The strongest reactions came from American respondents, whose public access television has traditionally been associated with notions of public participation, community reflection, and democratic practices (Linder, 1999). For respondents, community television is an arena in which a "community can speak to itself instead of being spoken to" (personal communication, 11/3/10). This is certainly warranted, given that many media outlets have gravitated away from "local accountability reporting" (Waldman, 2011). According to a recent congressional research report, community television is "used by 1.2 million volunteers and 250,000 community organizations," producing "20,000 hours of new programs per week"— statistics suggesting that these organizations are certainly in use (Goldfarb, 2008, p. 2). The notion of place, however, speaks to larger issues than just the dissemination of content. It speaks to enhancing diversity, facilitating conversation and discussion, empowering participants through media and digital literacy training, and fostering public participation. This last quality is especially salient among marginalized groups, such as ethnic minorities, the LGBT community, youth, and the elderly. Representatives from the lobbying organization American Community Television (ACT) also noted the transformation from "public access television stations" to "community media centers." This is an effort to

remain relevant and provide resources such as training facilities, media literacy, and production classes. This also reflects a move from the seemingly pejorative notion of "public access television" to the more positive, "community media" (Ali, in press).

In addition to defining their practice as "community media," media literacy is a central tenet for practitioners, who maintain that their primary goal is the training of participants. ACT's executive director, Bunnie Riedel, also notes that such hands-on production and skills training can allow participants to develop the critical skills necessary to decode the onslaught of media texts presented to Americans on a daily basis (personal communication, 11/3/10). Nantz Rickard of DCTV noted that one of DCTV's most successful endeavors targets youth in the Washington, DC, area through a "Youth Training Institute." This "institute" includes a television program (YAP-TV), a "training aspect, of running people through how to use the equipment, how create stories with it" through a partnership with the Smithsonian Institute, and an art and media literacy program. They also hold an internship program and other "experiential" programs, so that "youth can come to us after school and participate regularly, learning not just how to use the media and the tools, but to be part of how the community interacts with us" (personal communication, 11/9/10). Such opportunity for diversity speaks to the potential of community media centers to physically bring people together, and it also represents evidence many advocates use to defend their practice against detractors who argue that community-participatory media should only exist in the virtual domains of YouTube (see Fuentes-Bautista, 2009; Linder & Kenton, 2010, p. 7).

Contrary to the case of the United States, the Canadian public has largely been ignored or even barred from participating in community television since the late 1990s. Jim Macgregor observed how Winnipeg community television has taken a circuitous path with respect to place and publics. Community television began in Winnipeg as something dedicated to public participation and access. During these early decades, Videon Cable-11 operated with few censoring guidelines, and Macgregor could recall only a handful of instances where a producer was cautioned or a disclaimer aired. This ethos of democratic video production began to wane in the mid-1990s, finding its apex during the 1997 Winnipeg flood. During this "flood of the century," Videon took on a new role in regards to place, one that saw it divorce itself from the participating public and embody the conventions of mainstream broadcasting. Management committed to covering the flood in its entirety, with over 180 volunteers, including anchors and reporters, working 24 hours a day. This transition to a new genre of community television saw the channel dedicate itself to "professional" community coverage. It soon became the template for all Videon programming. Reflecting an implicit binary, this is an interesting divergence from the American experience, where direct operation of community television stations by cable companies is generally taboo. Nonetheless, with the recent round of CRTC (2010) regulations requiring quotas for public participation, Shaw-TV (as it is now known) is working toward re-integrating the public into its operations. Macgregor is quick to add that this will not be a "regression to the 1970s," but a new model, one balancing community-initiated with company-initiated programming (personal communication, 11/21/10).

In contrast to the U.S. "public-participatory model," and the Canadian "hybrid model," the British case represents a rather dislocated alternative to notions of place. Since local television is relatively nonexistent, many organizations (i.e., Southwark-TV and MonTV) have migrated to the Internet for distribution (OfCom, 2009, p. 43). For Southwark-TV, the Internet reduces

overhead, allowing the organization to devote more resources to video production and training. Operating under the positioning statement, "Web, Event, TV" Southwark-TV, and its parent, the Community TV Trust, aim to incorporate media with local life by showcasing community initiatives and events, along with school and youth-produced projects. It is not, itself, a television station, but rather, a resource for community members who wish to produce their own local media (C. Haydon, personal communication, 11/3/10). Given its online presence, founder Chris Haydon was adamant that, while the organization itself does not operate as a hub, it tries to create hubs in schools, community centers, and the like, and it focuses its energies on creating "shared public spaces" and places for physical meetings (personal communication, 11/3/10). Haydon has a great fondness for the democratizing potential of the Internet, but he admits the situatedness of community media is the crucial factor:

> But the thing that I like most, actually, even pretty much above the wonder of the web as the great solution for delivering this stuff, is bringing people together physically. . . . Some will be 12-years old and some will be 50 and have no experience whatsoever. And each will be as proud, or as frightened, or as timid, or as rewarded to have feedback. To feel somebody understands. And this is somebody who is in effect a neighbour, who lives in their area. So that mix of media, that overlap of media and local life, the mix of media practice and putting on local events to bring that overlap into life. So that media sharing isn't a virtual experience, there are other important dimensions. At the end of the day, media is just something that happens between people. (personal communication, 11/3/10)

Southwark-TV thus represents a disembodied place for community television, one without a central locus, but that nevertheless speaks to the central tenets of community media in giving voice to the voiceless and place to the placeless. Such a telling should not suggest an idyllic situation whereby community television organizations are free to control their own destinies. Rather, these media institutions continue to be plagued by a constant lack of funding, regulatory invisibility, and public irrelevance (see Timescape, 2009). What these examples do illustrate is that, regardless of organizational, funding, or content models, community television remains firmly rooted in a notion of place (see Howley, 2010). The station, community media center, or impromptu screening room becomes the location from which actors are able to create a public of participants.

Space

The concept of space suggests the difficulties in forming publics that are not situated within this aforementioned locus of place. For instance, respondents noted the difficulties in forming alliances with regulators and policymakers, with cable operators, and even with the general public. This last aspect is most troubling to respondents. As a member of OfCom noted, "discoverability—people knowing that services exist, and, even if they know that it exists, understanding what the content is"—is a considerable challenge for community media practitioners in the UK (D. Radcliffe, personal communication, 12/14/10). Similarly, in Canada, the challenge lies in building public awareness:

> [The] vast majority of Canadians don't even know this stuff exists. There is a blackout in terms of public awareness that they have these rights and can go to a cable company and demand these resources and a cable company can't say no in terms of programming if they don't like it. (M. Lithgow, personal communication, 11/10/10)

As a result, "community television became increasingly irrelevant for most Canadians," (ibid.). John Rocco of ACT also observed how one of his largest challenges as a community media executive and national lobbyist is convincing the public of the value of community television (personal communication, 11/8/10).

In essence, the notion of "space" refers quite literally to carving out spaces of attention, recognition, visibility, and relationships in an over-saturated and over-stimulated mediascape. Space also refers to the ability to form a public or publics of supporters that are not immediately affiliated with the community media center at the grassroots level. Other difficulties in forming publics of supporters have occurred at the national policy level, where community media organizations struggle to create impact. While respondents from ACT noted success in forming relationships with regulators and members of Congress, they remain hard-pressed to battle against cable and telecommunication companies. Riedel argues that community television still lacks the regulatory mechanisms to contest poor treatment by cable companies. She contends that, rather than a comfortable rapport existing between community television, cable operators, and municipal governments, "cable operators are the foxes watching the hen house," forming beneficial relationships with municipal councilors and waiting to revoke community television's claim on channels. From her perspective, "It's this knee-jerk reaction towards marginalization. And I think the other big challenge is finally being able to have a seat at the table. My joke is that access is always the red-headed step sister" (personal communication, 11/3/10).

American lobbying groups have had slightly more success than their Canadian or British counterparts in bringing community television to the attention of regulators. Still, though, in Canada, indicators suggest that this declaration may need reevaluation, since CACTUS was influential in pressuring the CRTC to enact definitions, access quotas, and cable company financial transparency rules (CRTC, 2010). While largely successful in this campaign, however, some express doubt as to the visibility of community television lobbying in Canada. In an extensive report submitted to the CRTC, for instance, Timescape Productions observed that, unlike the United States, Canada lacks an umbrella organization to lobby on behalf of community television on a nationwide scale (2009, pp. 22, 151). This is not insignificant, as it speaks to the aforementioned notion of "discoverability"—the ability to form publics of attention and support that are so crucial in matters of policy and regulation.

When compared with the United States and Canada, advocates in the UK have had least success. Haydon, for instance, noted how his organization is invested in lobbying OfCom, but acknowledges the difficulty in getting anything accomplished at the federal policy level (personal communication, 11/3/10). Additionally, the Community Media Association—the official organization of community media practitioners—has been involved in lobbying the BBC and OfCom. While community radio was officially sanctioned in 2004 with the *Community Radio Order*, little has been achieved with respect to television. For instance, while the 2009 "memorandum of understanding" with the BBC can certainly be read as an effort to carve out spaces of recognition, particularly in acknowledging the importance of community television, it has had minimal regulatory impact (see Community Media Association and BBC, 2009). [6]

[6] The UK has announced the creation of a new local television license and service, although it is uncertain

This section addressed the challenges of forming supportive publics of citizens, regulators, cable operators, and politicians. This disembodied and abstracted public—one completely divorced from the sanctuary of the community media center—cannot be described as a "weak public" (Fraser, 1992). Rather, it is a hypothetical public, one vital to the survival of community media, but yet to be fully realized.

Interface

Indispensable to both place and space is the role technologies, and more specifically, digital media, play in mediating organizations, relationships, and campaigns. On the one hand, advents in user-generated digital media have allowed dissenters to argue community television is obsolete—a relic of the analog age—now that "anyone" can post video online. On the other hand, digital media has permitted organizations to expand their original purview and venture beyond the confines of cable television to reach broader audiences and engage in new forms of education (Fuentes-Bautista, 2009). Technology represents a dialectic position within community media discourse (see Ali, in press)—a tension certainly present in the statements of respondents. U.S. respondents remained hesitant to abandon television, while a Canadian respondent was mixed, and a British respondent was supportive. This last observation should not come as a surprise, as migration from television to Internet suggests "placelessness" (see Ali, in press)—a mode of dissemination no longer dependent upon infrastructure. This ethos resonates in the organizational structure of Community TV Trust, as it has abandoned reliance on television and embraced a purely online platform. For instance, Haydon observed:

> [The] Web, magically and mystically, is the great answer to how do you deliver your local media that you produce. You don't need to reach in your television, you just need to get online. That has become ever easier, even here in the U.K., Web is the answer to getting you started, it costs next to nothing, and anyone can get to it, you can get your neighbour or the man three streets away. (personal communication, 11/3/10)

For Haydon, television has become "almost meaningless," as practitioners can distribute their productions through online platforms. In contrast, Ian Morrison, founder of lobbying group Friends of Canadian Broadcasting, quoted Northrop Fry to describe his feelings toward online community television, asking, "where is here?" Morrison argues "the Internet works away from here":

> [The Internet] becomes distance free and is volume controlled so that while it can facilitate local communication, it also takes people's eyes and ears and attention away from local If there were to be a healthy community with democratic participation, by people who are informed and concerned about the things that are going on in their lives, community television would be a part of that. (personal communication, 11/2/10)

Morrison points to the first of two lines of defense against Internet migration. The first is in defense of television—a powerful tool for connecting locally-oriented people (Ali, in press; Fuentes-Bautista, 2009). The second is that of place and practice—a power inherent in the physical space occupied by community media organizations (King & Mele, 1999).[7] In the

whether any license holder will incorporate participatory media practices (see DCMS, 2011).

[7] See also Ali (in press) for an ethnographic study of how one American-based community television station

first instance, Rocco argues that, as long as commercial networks remain wedded to broadcast and cable distribution, then so should community television (personal communication, 11/8/10). Similarly, Rickard argues that YouTube is itself a mainstream presence, and that its narrowcasting ethos speaks to the individual, rather than the community:

> We must recognize that the platform for community media is a direct reflection of the value we place on civic engagement, community participation, and the ideals of a democratic system. These attributes of our communities are the cellular structure of our democratic organism, and are at least as important as the various commercial and economic limbs that underlie most content generated by and for the dominant Market Presence. (personal communication, 11/9/10)

Importantly, Rocco and Rickard do not eschew the necessity of digital media, but do question its omnipotence. Rickard's station, for instance, has just undergone extensive renovation to include digital and HD compatible equipment, and both respondents are interested in broadening where citizens can access community content.

The second line of argumentation stems from the Internet's potential to usurp the physical places currently inhabited by community media organizations. This is what Riedel suggested when arguing that internet-driven capabilities such as File Transfer Protocols, which would allow users to remotely upload content to a community media "server," are harmful as they abstract human interaction from the mode of production (personal communication, 11/3/10). Addressing this pressing issue, Rennie (2007) makes the important distinction between "amateur" and "community" media. While both give participants access to the means of cultural production, the difference lies in the role of the community media organization. As she writes, community media organizations "provide access to production and distribution (as do other user-generated new media) *but also allow for participation in the running of the organization and the development of technologies*" (ibid., p. 31, emphasis added). Community media promote community and publics of citizens through both product (content) and modes of production (practice). To many, the place(s) and relationships in which community media are produced are as important, if not more, than content.

Contrarily, Macgregor observed how digital media have expanded freedom of expression and choice, and suggested that community television must "rise to that technology to survive and adapt" (personal communication, 11/21/10). He points to the need to follow the trends set by youth and is unsure a traditionally television-centered model is the way the community media world is headed. He tempers his call for a dislocated and disembodied space, however, by noting that the community television model will not die, but rather, must expand to become more accessible. For Macgregor, community television cannot hold on to a romanticized past, but rather, must continue to adapt:

> I've seen an incredible evolution in terms of technology, in terms of how people receive information, in terms of how people spend their time in their day. They're not glued to their television anymore. . . . So, personally, I think the Internet has become the community channel, big time. But it's so big, so vast, that it has, in a lot of cases, excluded the little guy who just wants to do a show about speaking Yiddish or something It saddens me that that sort of change has taken place. And yet, it's also exciting. (personal communication 11/21/10)

---

negotiates the concepts of place, "placelessness," television and digital media/user-generated content.

Conversations about digital media and Internet migration complicate the reification of "place." If user-generated content is everywhere, what becomes of community television? Many have rightly argued that this is not an "either/or" scenario. Instead, digital media should be seen as a complement to, rather than as competition with, existing practices (Fuentes-Bautista, 2009; see also Ali, in press). This is particularly true of what community media advocates tell policymakers. For instance, Alliance for Communications Democracy informed the FCC of the vast amount of online content offered by PEG groups, arguing that PEG centers are "uniquely positioned to help residents to extend content created through PEG facilities using social media and Web-based resources" (Linder & Kenton, 2010, p. 16).

This article has presented three cases for the implementation of digital media within community television practices: Southwark-TV represents a purely online model; Shaw-TV represents a hybrid model; and PEGs represent a television-centered model, although PEG leaders recognize the need to incorporate digital media. All three, however, demonstrate that these organizations realize they must go beyond television production to remain relevant to their communities (Ali, in press; Fuentes-Bautista, 2009).

Conclusion

In examining the tensions between policy, practice, place, and publics, I have discussed two intersecting visions for community television, both of which are necessary to secure its continuing survival. Not wrongly, a policy perspective focuses on the content of community television—its output— and its ability to contribute to the marketplace of ideas and deliberative democracy. I have critiqued this perspective for being too narrow, as it omits mention of places, infrastructure, and bodies. It fosters a Habermasean public sphere, one where deliberation and conversation are primary, and all else secondary. While this perspective serves to give community television *space* in the mediascape—i.e., channel capacity for community voices, (modest) funding, and recognition—what has been argued throughout this article is that it is equally important to give participants a *place* in the mediascape. That is to say, community television and community media *writ large* create publics both of deliberation and of *participation and practice*. This is accomplished through the primacy of the community media center, through educational classes for skills beyond those of television production (for instance, youth media literacy or basic computer skills), and through becoming a place where citizens can physically gather in space and time. This dynamic engenders the discussion of place, space, and interface. It is understating the problem, however, to believe community media organizations are fully in control of their own destinies—policy is critical in this regard, as is the formation of publics of attention, and visibility. The onus, moreover, does not reside exclusively with policymakers. In contrast, progress has been made to at least recognize the existence of community television by policymakers. Nevertheless, a more robust definition within regulation and legislation, through the inclusion of place, practice, and embodied publics, will aid in fostering a practice increasingly central to a communicative democracy (see Friedland, 2001; Howley, 2005; Rennie, 2006).

Part of the onus thus falls upon community media organizations, themselves, to continue disseminating their message and building the aforementioned publics of attention and recognition. Such a task lies at the heart of Radcliffe's comment that "discoverability" is a central

challenge for community media organizations. This concerns the notion of visibility—how to make the organization visible to the right people and recognizable to publics. Without this, the question must be asked: Does the mere fact that community television exists as an alternative to mainstream media and as a physical place signal a victory for the types of democratic practices described at the onset of this article? Indeed, as hyper-local, non-commercial entities, is the fact that they can, and do, carve a space and place for themselves in a world dominated by mainstream, commercial media, enough? Answering this question is not easy. I suggest, however, that practitioners may answer "yes." Not because they do not want to expand, but rather, because they "continue to fight for their lives" (Bolan, quoted in Delong, 2010, para. 1). They are aware that mere survival in a hostile environment is not enough. Visibility and the forming of supportive publics beyond the community media center may be a step toward securing a more robust contribution, both to their communities and to the larger project of democracy.

This research has its limitations. With only 10 respondents, I have only begun to discuss the experiences of community television in these countries. Additionally, participant observation and textual analysis should be employed to triangulate findings. Despite these caveats, this research has consequences for both the academic and community media reader. First, it demonstrates the tensions between policy and practice within the discourse and experience of community television. Second, it demonstrates the importance of physical place to community television and offers a strong rebuttal to those who argue that community television is obsolete in an era of digital platforms. Rather, community television's contribution in the mediascape is perhaps even more necessary given our schizophrenic relationship to place and community (see Castells, 2000; Howley, 2010). In an era dominated by commercial media and the distant voices of the national and supranational, community television often remains the lone outlet for community expression. More than giving voice to the voiceless, community media organizations give place to the placeless, through an emphasis on educational classes, media literacy, production, and the bringing together of citizens in time and space.

CHAPTER 13

News by Any Other Name: Community Radio Journalism in India

Bridget Backhaus

Journal of Alternative & Community Media 4, no. 2 (2019): 91–104. https://doi.org/10.1386/joacm_00051_1.

Abstract

Community radio journalism is a cultural resource that offers a voice to local communities and works to democratise media landscapes. Despite its indisputable value, community radio journalism in India faces a unique set of challenges: the foremost being that, officially, it does not exist. According to government policy, community radio stations are prohibited from broadcasting any news and current affairs content. The situation is further complicated by the presence of a development discourse underpinning the entire rationale for the sector. Instead of serving their listeners, community radio stations are beholden to a nebulous 'development' agenda. Under such circumstances, it is unsurprising that community radio journalism in India is relatively unexplored in the literature. This paper aims to address this gap by exploring how community radio practitioners in India source content and work around their restrictions in order to provide their listeners with relevant information and news.

Keywords

Community radio, India, news, journalism, development, social change

BY-NC-ND

Introduction

Community radio is considered to be a voice for the voiceless and a stronghold of alternative views. Similarly, community radio journalism also has a tradition of democratising the media and acting as a cultural resource to provide communities with a local voice (Forde, Meadows & Foxwell-Norton, 2002). In India however, community radio journalism faces a unique set of challenges: the foremost of which being that, officially, it does not exist. Government policy prevents community radio stations in India from broadcasting any news or current affairs coverage. Employing the concept of community radio as rhizome as a theoretical framework, this article explores the fluid and contingent nature of community radio news and journalism in an environment where it officially does not exist. Drawing on ethnographic research at two stations in South India, audience and broadcaster interviews highlight the resilient and contingent nature of community radio journalism in India.

Journalism and news in community radio

Community media have long been associated with alternative, grassroots forms of journalism. This section aims to establish a general definition of community radio journalism and a subsequent framework for analysis. There are numerous definitions of community radio journalism within the literature. In his seminal work, *Radical Media,* Downing (2000) suggests that the role of community media producers is to be in constant interaction with their audiences and to assist them in developing a critical worldview. Atton (2001: 112) takes a more specific stance, arguing that community media journalists should 'present news that is relevant to those communities' interests, in a manner that is meaningful to them and with their collaboration and support'. Forde (2015) suggests that there are four consistent traits of community media journalism that recur throughout the literature: firstly, they encourage civic participation and provide information to motivate citizenship; secondly, alternative journalism places emphasis on news that is immediately relevant to their audience; thirdly, alternative journalists fill gaps in mainstream news coverage; and finally, alternative journalism offers a critique of dominant media narratives and processes. These traits offer a broad working definition of community radio journalism from which to base this inquiry.

Building off this definition of community radio journalism, this research employs the rhizome as a frame of analysis. Alternative media as rhizome offers a useful theoretical approach to community radio news and journalism and is one of Bailey, Cammearts and Carpentier's (2007) four theoretical approaches to community media. While Carpentier et al do emphasise the importance of considering these approaches together, they concede that the fourth approach, community media as rhizome, should be granted special attention (Carpentier, Lie & Servaes, 2003; Santana & Carpentier, 2010). Based on Deleuze and Guattari's (1988) metaphor, community radio as rhizome refers to the fluid, contingent nature of the medium and the ways in which community radio connects various disparate elements of society to each other (Bailey et al., 2007). Deleuze and Guattari (1988) suggest a number of characteristics of a rhizome: connection, multiplicity, heterogeneity, no beginning or end, it is always between things, an intermediary. They see the philosophy of the state as arbolic: linear, hierarchical and static; in contrast, the rhizomatic is 'non-linear, anarchic and nomadic' (Carpentier, Lie

& Servaes, 2007). This connection and heterogeneity imply that any point of the network can connect to any other point, while multiplicity suggests that rhizomes operate outside of fixed sets of rules (Santana & Carpentier, 2010). Therein lies the importance of community media: through the 'catalysing role they can play by functioning as the crossroads where people from different types of movements and struggles meet and collaborate' (Carpentier et al., 2003: 62). This mediated interaction need not take place at the individual level and can involve groups, organisations, and even interpretive communities (Carpentier, 2015). Indeed, community media as rhizome also accounts for the linkages and interconnections between community media and civil society, as well as with the market and state (Carpentier & Doudaki, 2014). A clear example of community radio news as rhizome is offered by Van Vuuren (2001). In her research on community radio in Australia, she observed the range of community connections that contributed to the news broadcast on just one station:

> Weather reports are provided by local professional fishermen; a local taxi company gives traffic reports; a market report comes from the Brisbane-based wholesale fruit and vegetable market; and the station broadcasts a job search program with the assistance of employment agencies (Van Vuuren, 2001: 15).

This is illustrative of community radio's role as what Potapchuk and Crocker Jr (1999) term a 'bridge-building organisation', which they see as essential to maintaining civic capital and collective collaboration. Applying the metaphor of a rhizome to community radio journalism offers insight into the ways in which community radio journalism draws from and connects various disparate aspects of the community, as well as the necessarily fluid and contingent nature of community radio newsgathering. Thus, it provides a useful frame for explorations into community radio journalism in India, an environment where community connections and contingency are particularly important.

Community radio in India

Having established a broad view of the role and characteristics of community radio news and journalism, it is now essential to situate the community radio sector in India. Community radio has had to fight for its small space within India's megalithic media landscape. The space that community radio does occupy is tightly controlled by stifling legislation, specifically the Indian Telegraph Act (1885) alongside the India Wireless Telegraphy Act (1933), which make the possession of radio equipment without a licence illegal and effectively ensure that the exclusive rights to establishing, maintaining and operating radio and television broadcasting remain with the Central Government (Kumar, 2003; Pavarala & Malik, 2007).

Many scholars have noted the extensive legislative obstacles which have been placed in the way of Indian citizens obtaining their constitutional right to freedom of speech and expression (Gunaratne, 2000; Saeed, 2009; Sen, 2003; Thomas, 2011). A key breakthrough in the struggle for community radio, and indeed the media environment generally, in India was the Supreme Court's historic 1995 ruling that the 'airwaves are public property' and should be used for public benefit (Pavarala & Malik, 2007; Sen, 2003; Singhal & Rogers, 2001; UNESCO, 2011). It was not until after this ruling, in 1998, that the state broadcasters—All India Radio (AIR) and television station Doordarshan—were granted relative autonomy from the government, despite the recommendations of two separate committees: the Chanda Committee in 1966

and the Verghese Committee in 1978 (Singhal & Rogers, 2001). This landmark ruling proved to be of critical importance not only to the public broadcasters and communication rights more generally, but also for the community radio movement.

The first direct step towards community radio in India took place in September 1996. A group of media professionals and policy experts gathered in Bangalore to explore the relevance of community radio for India (SANCOM, 2015). The 'Bangalore Declaration on Radio' made a strong case for community radio, describing it as 'public service broadcasting in its most decentralised and its most democratic form' (Sen, 2003: 2199). Following this, the push for greater communicative and media freedoms gained momentum across the country. Then in 2000, a group of activists, academics and radio practitioners met and established the first systematic case for the creation of community radio as a third tier of broadcasting in India, separate to the government-run and commercial sectors (Pavarala, 2013). The declaration resulting from the meeting, which was supported by UNESCO, known as the 'Pastapur Initiative on Community Radio' after the area in which the meeting occurred, defined community radio as having 'three key aspects: non-profit making, community ownership and management, and community participation' (Sen, 2003: 2199).

In late 2002, the Ministry of Information and Broadcasting finally released 'Community Radio Guidelines'. Far from being a victory for the community radio movement, the guidelines restricted licences to 'well-established' educational institutions and banned advertisements and news and current affairs programmes (SANCOM, 2015). Following this, India's first community radio station was established at Anna University in Chennai. Anna FM began broadcasting in February, 2004, to the area surrounding the university (Ghosh, 2011; Nirmala, 2015; Prabakar, 2009). Stations affiliated with educational institutions, often referred to as 'campus radio', have been subject to some scrutiny and criticism over the years. Thomas (2010: 221) bluntly states that campus radio has 'very little potential for becoming a tool for development'. Similarly, Prabhakar (2009) writes that activists are sceptical of the role of campus radio stations, in that expecting them to serve communities outside of their campus confuses the community radio mandate with that of public broadcasting. Despite the disappointment of such restrictive guidelines, the following years marked a renewed push for community radio with a number of stations exploring alternative methods of distribution including narrowcasting and cablecasting (SANCOM, 2015).

While community radio was treading water, another grassroots movement was taking root. India's Right to Information (RTI) movement was another important milestone in the lead-up to community radio. The movement was also of vital importance to the broader media environment. Thomas (2011), who has written extensively on the RTI movement in India, even suggests that the RTI movement played a role in revitalising participatory democracy in India. The RTI movement began in central Rajasthan in the late 1980s with a small group of social activists and local people who took an interest in livelihood issues including the failure of the government to enforce minimum wage regulations, and the availability of subsidised foods (Jenkins & Goetz, 1999). The critical tool of this movement was the *jan sunwai*, a type of public hearing in which local issues are discussed by members of the community. Thomas (2014) suggests that *jan sunwai* act as local public sphere based on local idiom, in contrast with Jürgen Habermas's bourgeois and exclusive interpretation of the public sphere, and that its strength lies within its deliberate inclusivity in which all local people have space to share

full accounts of their experience. The campaign for RTI laws incorporated the *jan sunwai* as well as other local information dissemination techniques such as street theatre to gain critical mass. In June 2005, the Right to Information passed and what started as agitation for basic livelihood-related entitlements became an important precedent for communication rights in India. Thomas (2008: 43) writes that the movement offers the 'best hopes for the rural poor to fulfil their right to development'. The success of the RTI movement can be attributed to a number of factors: firstly, it was an indigenous social movement that occurred in response to local needs; second, it employed familiar, colloquial tools, including *jan sunwai* and community theatre; and third, the movement gained significant momentum and was supported by a large group of people who understood the need for RTI and were willing to mobilise themselves and others in pursuit of this goal (Thomas, 2011). It is worth noting that, while the RTI movement attracted significant attention in the mainstream media, the push for community radio was largely ignored (Saeed, 2009).

Finally, in late 2006, a second phase of policy guidelines for community radio stations was released (UNESCO, 2011). Alongside educational institutions, NGOs and agricultural science centres or *Krishi Vigyan Kendra* (KVK) were granted the right to apply for licences. News was still not permitted but limited advertising, up to seven minutes per hour of broadcasting, was allowed (SANCOM, 2015). In October, 2008, Sangham Radio in Pastapur village launched to become the first community radio station licensed to an NGO, with their licence held by DDS, the Deccan Development Society (Ghosh, 2011; Pavarala & Malik, 2007).

More than ten years after the updated guidelines were released, community radio in India now finds itself at somewhat of a crossroads. As of May 2018, there were just 217 operational stations (Ministry of Information and Broadcasting, 2018); a somewhat meagre number for a country with the population size of India. Malik (2016) writes that the movement seems to have plateaued:

> It is neither growing nor prospering. While there is recognition and acceptance of its potential in the upper echelons of administration, it looks as if there is a decline in buy-in from grassroots practitioners and communities in India.

The sector is facing a number of internal problems associated with sustainability and independence. In addition, the contemporary regulatory environment is still rigid and tightly controlled. Compared to the free-for-all of commercial broadcasting, community radio must adhere to the strictest rules around revenue-generating advertisements (Thomas, 2010). Alongside this, the restrictions on news content remain, and licences are only granted to educational institutions, agricultural groups, and well-established NGOs. It seems as though there is little room for community media journalism under these stifling conditions; indeed, such structures appear to more closely align with the aforementioned arbolic, hierarchical approach of the state. Where then does this leave community radio journalism in India? Is it, as the guidelines dictate, non-existent? Or does it, like the community radio sector itself, carve out a niche space to occupy?

Methodology

This article draws from a larger project involving ethnographic research conducted at two community radio stations in the South Indian state of Tamil Nadu. The state has a long history with local broadcasting and was the site of early farm radio experiments in the 1960s (Page & Crawley, 2001). Later, Tamil Nadu was a hub of activism throughout the push to establish community radio in India and was the location of the first iteration of community radio in India, Anna FM in Chennai. Further, Tamil Nadu is home to the highest number of community radio stations in the country: as of May 2018, there were 31 operational stations (Ministry of Information and Broadcasting, 2018). The site stations for this research were selected based on their locations and ownership models—both rural stations with NGOs as parent organisations. The aim was not generalisation or broad representation of the community radio sector, but rather tracing a complex social phenomenon. The diverse nature of community radio stations means that it is difficult to generalise across any two stations, even if they are in close physical proximity to one another, let alone on a national or international scale. As such, the purpose of the multi-sited nature of this research was simply to explore how different stations take different approaches, rather than making holistic generalisations or recommendations.

The primary methods of data collection were participant observation, interviews, and focus groups. Participant observation took place throughout the research and occurred in several stages. Initially, observation was centred on the station itself, with a period of time spent at each station, observing and recording the activities of staff, as well as any visitors to the station, and any other happenings. The second phase of participant observation draws on Couldry's (2006: 4) notion of 'decentred media studies': a form of media studies not necessarily focussed on traditional sites of media production and consumption. In a related, though more practice-driven article, Couldry (2004: 125) advocates for asking 'open questions about what people are doing and how they categorise what they are doing, avoiding the disciplinary or other preconceptions that would automatically read their actions'. Following this, the second phase of participant observation saw the research move outside of the stations to incorporate the work that takes place outside traditional sites of production. This stage of participant observation was highly dependent on developing relationships with the key informants and involved work shadowing and what Kusenbach refers to as 'go-alongs' (2003). A cross between interview and participant observation, go-alongs involve accompanying informants on their everyday outings in order to understand their experiences of their physical and social environments (Kusenbach, 2003). Asking questions, listening, and observing while informants move through these environments represents a more active, focussed, and outcome-oriented approach, rather than just 'hanging out with key informants—an ethnographic practice that is highly recommended in virtually all fieldwork manuals and textbooks' (Kusenbach, 2003: 463). Observations from these events, as well as time spent at the station and on go-alongs, were recorded in comprehensive field notes that included pure observations, as well as emerging prospective theories or areas for further research and analysis. As Hammersley and Atkinson (2007) suggest, periods of observation were selective and complemented by periods of reflection and recording, rather than attempting to capture absolutely everything.

Participant observation formed a major part of the data collection and also contributed to informing the topics to be discussed during interviews.

Interviews were semi-structured and in-depth with open-ended questions aimed at collecting descriptive qualitative data. The questions were general and aimed at generating discussion rather than imposing definitions or interpretations. The aim here, as Couldry (2004: 125) explains, was to ask 'open questions about what people are doing and how they categorise what they are doing, avoiding the disciplinary or other preconceptions that would automatically read their actions'. So as to understand the day-to-day operations and activities of the stations, interviews took place following a period of participant observation, go-alongs, and work shadowing. Ratan and Bailur (2007) note that ethnography, through immersion in everyday life, can help illustrate and clarify discrepancies between what has been observed and data that has been collected directly from the participants through surveys or interviews. In addition to collecting specific data, interviews were also used to clarify what had been observed, and subsequent interviews were occasionally used to question any discrepancies between what was done and what was said. Several approaches to interviewing were implemented in a specific order. First, towards the end of the period of participant observation, focus group discussions were conducted with groups of audience members. Following the completion of these, group interviews were conducted with the staff at the radio station, followed by one-on-one, in-depth interviews with the key informants at the stations. The use of these three methods—participant observation, interviews with staff, and focus group discussions with listeners—acted as a way of triangulating data by testing sources against one another (Creswell & Poth, 2017).

The data collected from both the interviews and participant observation was subsequently analysed using constructivist grounded theory. While grounded theory traditionally aligned with positivist and post-positivist research (Clarke, 2007; Spencer, Pryce & Walsh, 2014), it was adapted to constructivist inquiries by Kathy Charmaz (2014). She writes that, in contrast to Glaser and Strauss 'discovering' grounded theory, neither data nor theories are discovered, but constructed (Charmaz, 2014) Any resulting theories are interpretive portrayals, rather than exact representations of the studied world: 'We construct our grounded theories through our past and present involvements and interactions with people, perspectives, and research practices... Participants' implicit meanings, experiential views—and researchers' finished grounded theories—are constructions of reality' (Charmaz, 2014: 10). Interviews, fieldnotes, and documents were initially coded taking an open, line-by-line approach, before using axial coding to identify relationships between existing codes and synthesize the data in new ways (Charmaz, 2014). Finally, the data was re-coded based on thematic topics arising from the previous analysis of the initial coding phases. These thematic topics were placed in conversation with existing bodies of work and literature in order to build an understanding of community radio news and journalism in India.

Findings and discussion

The primary finding of this research is that, despite the ban, community radio news and journalism in India seems to be doing quite well. At both stations, discussions of news and journalism were common among both broadcasters and audience members. It is worth re-

emphasising here that the phrases 'news' and 'journalism' were deliberately avoided during interviews and discussions so as not to lead or bias the responses. The use of such terms emerged organically from the broadcasters and the audiences themselves. There are several key themes for discussion that emerge from the findings of this research. The first theme discusses the constructions of audience by broadcasters and the ways in which audiences themselves construct news. The second area of discussion involves how broadcasters navigate the restrictions on news, which primarily takes place through provisions of 'non-news' and the use of alternative news broadcasting formats. Finally, this paper attempts to understand why the government has taken such a stance on news within its community radio policy and the implications of such an approach.

Constructions of audience

A key finding of this research relates to constructions of audience, both in terms of how audiences are constructed by broadcasters and how audiences themselves construct news. McQuail (1994) suggests that self-constructed images of audience are a way for journalists to manage uncertainty. Conversely, Gans (1979) suggests that journalists consider themselves audience representatives and thus see the audience as similar to themselves. Meadows (2010) contrasts earlier relations between producers of news and their audiences, which he sees as more intimate and with fewer barriers, with modern journalism and mass media, where public opinion is formed, rather than reported on. These murky constructions and barriers between producers and audiences bring to mind Anderson's (2006) 'imagined communities', in which he suggests that communities are merely constructions created by their members based on shared attributes. Indeed, MacNamara (2013: 161) suggests that media audiences are 'doubly assumed and imagined—assumed and imagined to exist and assumed and imagined to listen'. If community media is to be truly grounded within their communities, the audience-producer barrier, so prominent in mainstream media, must be 'down' (Forde, 2015). Further, there must be clear conceptualisations of local audiences if the content is to be relevant as it is this relevant content that facilitates the strong community connections that break down these barriers (Forde, 2015). What was observed at both stations throughout the research were clear conceptualisations of audience based on ongoing interaction and social relationships that act as rhizomatic links between different groups. This is demonstrated in the following comment from a broadcaster:

> Earlier, we used to do agriculture-related programs, with whatever resources we had. But then we got feedback at one of the events we arranged. They asked us to give information about the seasonal crops, about what could be planted in which season, and how it can be maintained. So, we got messages from agricultural officers regarding the monsoon and suggestion for crops that are appropriate to be planted in monsoon. As per the listeners' requests, we started broadcasting this information in the radio. We started changing our program schedule as per the listeners choice.

These connections directly impacted upon the content that was produced: broadcasters demonstrated a strong understanding of who their audiences were, and this was reflected in what they broadcast. When viewed through a lens of traditional, Western news values such as timeliness, significance, proximity, conflict, human interest, novelty and prominence (Masterton, 1995), information about seasonal crops may seem out of place. Nonetheless, it

is locally significant information and, as Atton (2001) suggests, is an alternative construction of news appropriate for the alternative press.

There were similar findings in terms of the audiences' perceptions of the work of their local community radio stations. As far as the audience members who were interviewed were concerned, they were listening to news. It was timely, local news, specifically relevant to them. It was their news. One audience member was particularly adamant about the news broadcast on their local station, exclaiming, 'But there are lot of news broadcasted in the radio!'. The specific, local nature of the news content was also appreciated:

> They report if there is any incident in the locality and warns us to be careful. Even if we don't happen to cross that particular area, we can know if any accidents happen in the locality through radio. They instantly deliver news, and each programme gives us new information that is very helpful.

Such hyperlocal news fills a critical gap in media coverage, particularly in rural areas. The specific, local nature represents a key aspect of audience conceptualisations of news, alongside timeliness and direct relevance of the content to the audiences. This aligns with two of Forde's (2015) consistent traits of alternative journalism, discussed earlier, through its immediate local relevance and addressing a gap in mainstream news coverage. In an earlier work, Forde (2010) writes that news and current affairs coverage on community radio fills a critical gap in local news coverage that is overlooked by mainstream media outlets. She notes that 'this model of "journalism", or more accurately, news provision, sits more closely with newer forms of citizens' journalism and audience-driven journalism than the traditional formats of news production' (2010: 188). Returning to the Indian community radio sector, Pavarala, Stalin and Venniyoor also see the provision of local news and information as a key aspect of community radio programming, and thus the ban on news and current affairs represents 'a restriction on freedom of expression' (2011, p. 76).

The implications for freedom of expression hint at the broader impact of hyperlocal journalism on community radio audiences. Not only does hyperlocal journalism fill a critical gap in news coverage, but the close relationships and ongoing communication between community radio broadcasters and their audiences serve other purposes. A recurring theme throughout the focus groups of female listeners was the notion of empowerment and the community radio stations' facilitating roles. Participation in their local community radio stations, even at the level of simply being interviewed for a programme or volunteering to conduct listener surveys in their local village, had a profound effect on women. One female listener discussed the first time she was invited to take part in a programme:

> In the beginning, a negative attitude to talk and participate in the radio was there. But my in-laws came and saw the programme at the station. My husband too. The respect we get in the station and the exposure to what they do in the program changed their attitude. Now also in our home, they wish and send us to participate. In many homes they support them.

Participating in radio and news production was an empowering experience for many of the female listeners, who were able to exercise their right to communicate and be heard. The concept of voice is key here. As one female listener put it, 'We speak in many places and that's different. But in radio, people listen to what we speak.'

Hyperlocal journalism and the relationships between community radio broadcasters and their audiences clearly have broader implications beyond news coverage. As Malik (2012)

wrote in a piece for media watchdog *The Hoot*: 'Indeed, for those who have traditionally been unacknowledged and silenced, socially and culturally, the opportunity to have one's voice heard can be an imposing experience of self-worth'.

'Non-news'

As mentioned, the key finding of this research is that, from the perspective of broadcasters and audiences, community radio news and journalism is alive and well, and even prominent within the broadcasting schedules of the stations. At both stations, broadcasters discussed gathering and broadcasting community 'news' without hesitation. Similarly, audience members discussed tuning in to the stations specifically to hear local news. How can this be the case in such a strict regulatory environment? A lack of enforcement is not the case, with several stations recently receiving warnings about their content (Seshu, 2017). A potential reason for this somewhat lax attitude towards the news restrictions could be the provisions made for community radio stations to broadcast what the policy terms 'non-news'.

As discussed, the Government of India's Ministry of Information and Broadcasting specifically bans news, current affairs and anything remotely 'political'. Categorising community radio news and current affairs as inherently political is problematic: as Tacchi (2011: 118) argues, it is instead 'vernacular information sharing and discussion around local interests… this is not political, as seems to be assumed (that news = politics) in the Indian policy'. This hard-line stance was slightly softened in 2017 when the government allowed community radio stations to broadcast bulletins produced by All India Radio, the state broadcaster. The move was heavily critiqued by activists as it completely missed the point of their calls to allow community radio stations to broadcast original news (Seshu, 2017). The recommendations underpinning this policy identified several categories that are considered 'non-news':

> '(a) Information pertaining to sporting events excluding live coverage. However live commentaries of sporting events of local nature may be permissible; (b) Information pertaining to Traffic and Weather; (c) Information pertaining to and coverage of cultural events, festivals; (d) Topics pertaining to examinations, results, admissions, career counseling; (e) Availability of employment opportunities; (f) Public announcements pertaining to civic amenities like electricity, water supply, natural calamities, health alerts etc. as provided by the local administration; (g) Such other categories not permitted at present that may subsequently be specifically permitted by Ministry of Information and Broadcasting from time to time' (Bhawan & Marg, 2014: 10).

One could argue that most of these categories form a solid basis of the day-to-day content of community radio stations and, in a hyperlocal setting like community radio, could even be considered 'news'. Forde, Meadows and Foxwell (2002) argue that news, in the context of community radio, often refers to events of interest in the local area or public service announcements, categories which could potentially include all of the 'non-news' mentioned above. This could explain broadcaster attitudes towards news: what they consider 'news' could easily fall under a category of 'non-news'.

A further method of circumventing the restrictions was the avoidance of news bulletins in a traditional format. Neither station broadcast regular news bulletins, though both offered topical information including market prices, dam water levels, traffic, and weather at the same time each morning. Such an approach is by no means unique to India. A more extreme example took place during the 2005 coup in Nepal, which saw a complete ban on news broadcasting.

Community radio stations circumvented this ban by broadcasting educational programmes on topics such as the rights enshrined in the Nepali constitution, the processes for suspending these rights and the Geneva Convention, as well as employing local comedians to sing the news, methods that enabled them to continue broadcasting throughout the despot's 15-month rule (Girard, 2007). Alternative formats were also observed by Forde, Meadows and Foxwell (2002) who, in their study of Australian community radio, found that most community radio stations did not have dedicated news and current affairs programming but instead delivered local news and information throughout the content of various other programmes. This was indeed the approach observed at both stations, which would explain both the broadcasters' and the audiences' attitudes to news coverage. The news is there, it just may not take the form of a traditional, on-the-hour bulletin. Van Vuuren (2001: 78) suggests that community media function best when contributing to community development processes and, as such, the 'news imperative—with its emphasis on professionally produced "hard", "serious", political and controversial information' could be reduced. This concept of community development is of particular importance in the context of the community radio sector and is a significant influence on the value placed on news and journalism.

Development and news

Journalism has been widely employed as a tool of development. Manyozo (2012) observes that development journalism has been implemented as rural journalism in India, given the large percentage of the population in impoverished, rural areas. Similarly, community radio has also been primarily used as a tool for development, because, as Ashish Sen (2007) observes, community radio has demonstrated its ability to empower communities, particularly poor and rural communities. By this logic, and given the development goals of the government, one would assume that local journalism and community radio are a match made in heaven, from a development perspective at least.

So why then has the government taken such an approach to news? A potential reason is that community radio journalism potentially represents a source of narratives of dissent or resistance, particularly seeing as those rural, poor communities served by community radio stations are the same communities that struggle to access resources and assistance from a government so focussed on development. Mohan Dutta suggests that narratives of resistance that are often co-opted by discourses of nationalism and homeland security and portrayed as 'threats to security' (Dutta, 2014). This has been observed elsewhere in the community radio sector in India, where licence applications from 'troubled regions' have fallen victim to the Ministry of Home Affairs and its overzealous approach to national security. Pavarala (2013: 3) observes that the entire northeast as well as those areas affected by Naxalite insurgency are served by a minimal number of stations as compared to the rest of the country. Interestingly, Moitra, Kumar and Seth (2018: 126) observe that the groups who would benefit most from community media platforms are 'women, those in Naxal areas, and groups marginalized by caste or class'.

There are a several other reasons that represent significant challenges for the sector and may also impact upon how news is prioritised among stations. Given the restrictions on ownership models, limited to established NGOs, educational institutions and KVK, a major challenge is the 'NGOisation' of the sector. Stations are expected to conform to the

agenda of their NGO parent body who, in turn, are under pressure from donors to 'scale up' operations and demonstrate impact (Malik & Bandelli, 2012; Pavarala, 2015). Subsequently, news and current affairs coverage may not be a priority. A more systemic problem associated with this is the community radio sector's underlying, and potentially outdated, focus on development. Pavarala (2015) argues that there is now a need for the sector to move past its developmentalist agenda, which he sees as a legacy of postcolonial nation-building, and focus more on the development of communication rights. A comparative study of the community radio sectors in Nepal, Bangladesh and India revealed that while community radio stations in Nepal have a strong focus on local journalism in their content, community radio stations in Bangladesh and India tend to focus more on 'information provision and providing links to welfare/development services' (Arora, Ramakrishnan & Fernandez, 2015: 33). This raises further questions about the fundamental purpose of community radio. In this case, a development agenda overpowers the potential of community radio for journalism, activism, communication rights, and acting as an alternative public sphere. News and current affairs coverage could be considered unfortunate collateral damage.

An overarching development discourse could be observed throughout many aspects of the day-to-day operations of the community radio stations visited. An example of this was discussed in one of the audience focus group discussions:

> I very well knew about everything before. The information given on radio could be considered as additional qualification.
>
> I hear a lot of informative news from the radio but I cannot tell that I learnt anything new. They tell information that I already knew.
>
> But in present situation agriculture is not in its full glory. There is no rain and there is no conditions favourable for doing agriculture. So the information told in the community radio is not useful at all. Even though the programs broadcasted in community radio reaches people, it is neither useful nor impactful as there is no rain and no agriculture.

Here we can see a clear disconnect between the broadcasting priorities of the station and, by extension, its parent body, and the realities of their audience. The development agenda could be observed through the provision of information about increasing yield and treating pests, but the lack of local contextualisation meant that such information was irrelevant to the audience. Taking a different perspective and applying the traditional 'news values' (which are, according to Masterton's (1995) seminal article: timeliness, significance, proximity, conflict, human interest, novelty and prominence), a focus on development without appropriate local contextualisation strips community news of its news value.

Conclusion

Despite the restrictive environment of development imperatives, ownership structures and strict government legislation, it seems as though community radio news and journalism is alive and well. Though it may not necessarily take the form of a slick three-minute bulletin on the hour every hour, there is news and journalism in community radio in India, and it is seen as a key aspect of the day-to-day activities of stations. Close relationships and strong networks with audiences help community radio practitioners engage in hyperlocal journal-

ism from the margins that results in news that may not conform to mainstream, large-scale definitions, but nonetheless serves to let local voices be heard and contribute to the democratisation of the public sphere. The primary threat to community radio news and journalism does not necessarily come from overzealous restrictions on news, but rather an overarching development discourse that imposes programming imperatives and fails to account for the local broadcasting environment. As for next steps though, opening up the legislation to allow news broadcasting remains a priority for academics and activists. A key recommendation of UNESCO's National Consultation on Strengthening Community Radio in India, specifically called on the government to 'Relax content restrictions on community radio, and permit free collection and broadcast of local news and information over CRs.' Successive governments have failed to make community radio a priority in India, despite the valuable work being done in the sector. But at least there is some comfort in the fact that hyperlocal, community journalism has found a way, despite the odds.

CHAPTER 14

‘In the Waiting Room’: Digitisation and Post-Neoliberalism in Buenos Aires’ Independent Music Sector

Geoff Baker

In *Music and Digital Media: A Planetary Anthropology*, edited by Georgina Born, 90–134. UCL Press, 2022.

Abstract

This chapter analyses the independent music sector in Buenos Aires in the wake of two major developments of the 1990s and early 2000s, digitisation and the national economic crisis of 2001, drawing primarily on fieldwork in 2011–13. The first section outlines the Buenos Aires music industry, focusing on independent labels and artists, and exploring the relative fortunes of the digital content and live music sectors. The second section takes as a case study a small label, ZZK Records, and the genre around which it coalesced, digital *cumbia*, examining the label’s changing relationship to digital technology and its economic strategies. Other strands of digital cumbia production are also considered. The final section explores the role of the state in the field of digitisation and culture. Alongside digitisation, Argentina saw a political transition to centre-left populist governments, and the two became increasingly entwined. The Kirchner governments (2003–15) saw new policies aimed at supporting the independent music sector and, more broadly, the emergence of a post-neoliberal paradigm for the cultural

CC BY-NC

industries that sought to catalyse progressive alternatives to digital capitalism. An ethos of collectivism arose in response to the opportunities and challenges provided by digitisation and post-crisis economic realities. Many related developments came to an abrupt halt with the election of the centre-right candidate Mauricio Macri as president in late 2015.

Introduction

From the turn of the millennium, Buenos Aires emerged as a major centre of electronic dance music (EDM) in Latin America. As well as constituting an important regional hub for international EDM, it was also at the heart of the creation of new styles that reinvented traditional Latin American genres by incorporating digital technology and aesthetics. Argentinean laptop artist-producers mixed Latin American and Caribbean popular and folk musics with electronic genres like techno, dub, dubstep and dancehall to create new hybrid styles—first electro-tango (around 2000) and subsequently digital *cumbia* and digital folklore. Among the main driving forces that fostered the latter genres and propelled them to the global stage was the Buenos Aires label ZZK Records, internationally recognised as an important creative force in contemporary Latin American electronic music.

I was drawn to this area for a number of reasons. *Cumbia*, a genre of Colombian origin that spread across the Americas in the mid-twentieth century, had until recently been somewhat underrepresented in the academic literature, considering its significance in the region.[1] It had been an important feature of working-class musical life in Argentina for some fifty years, and while Argentinean sociologists had paid considerable attention to cumbia villera, with its intimate connection to the neoliberal 1990s and subsequent economic crisis, the music's more recent incorporation and transformation by middle-class laptop producers in Buenos Aires and the emergence of a middle-class cumbia scene had attracted minimal academic attention.[2] These developments seemed worthy of further study, since they pointed to a new phase in the history of this genre, one connected to wider changes in Argentina since the turn of the millennium. The country's decade of neoliberal capitalism, the 1990s, culminated in a catastrophic economic crisis in 2001, ushering in the centre-left Peronist governments of Néstor Kirchner (2003–7) and Cristina Fernández de Kirchner (2007–15). One consequence of the crisis and subsequent turn to nationalist and regionalist politics was increasing identification with Latin America on the part of a middle class that, in Buenos Aires at least, had long been famed for its Europhilia. This significant socio-political transformation was felt in the musical sphere. Rock had exercised a considerable hold over Argentinean audiences since the 1960s: Argentina was a pioneer in the development of rock en español in Latin America and is frequently described in middle-class circles as 'a rock country'. Yet while rock retained considerable popularity, national folkloric musics and internationally circulating Latin American genres such as cumbia were gaining increasing visibility among the middle and upper classes (Sánchez 2014). Digital *cumbia* and folklore thus spoke of wider social, political and cultural transformations, and with ZZK Records foregrounding the digital at the level

[1] The subsequent publication of several books (such as Vila and Semán 2011; Semán and Vila 2011; Fernández L'Hoeste and Vila 2013) altered this picture.

[2] There is an extensive literature on *cumbia villera*, in which the work of Pablo Semán and Pablo Vila has been particularly important. Irisarri 2011 is, however, the only study of digital *cumbia*.

of both musical aesthetics and institutional self-presentation, this label and its genres were potentially fertile terrain for studying the nexus between music, politics and new technologies.

For all the increasing legitimation of *cumbia*, however, ZZK's music was largely divorced from the mainstream *cumbia* or 'tropical music' scene in Buenos Aires, which was dominated by the 'popular' (that is to say working and lower-middle) classes. ZZK was tied more closely to the middle-class indie rock and alternative EDM scenes, illustrating that class divisions subsumed genre connections. During 2011 laptop *cumbia* became established in the commercial *cumbia* scene, due above all to the huge success of the boy band Los Wachiturros, which spawned many imitators and rivals, and a new subgenre—*música turra*. However, it was emblematic of Buenos Aires' class and geographical divides that these distinctive strands of digital *cumbia* barely intersected. This study thus focuses primarily on a niche of middle-class, independent musicians and labels rather than the *cumbia* mainstream, though it also considers *música turra*.[3]

Examining these actors provided insights into the fortunes of a sector of the music industry under digital conditions. The music industry suffered heavily in the aftermath of the 2001 crisis, and while it soon began to recover, it was then subject to many of the challenges experienced at global level with the explosion of internet access. Nevertheless, there were also important continuities: for example, the multinational major labels, long established in Argentina, continued to control over 80 per cent of the record market, and concerts by middle-aged rock stars from the global North filled stadiums. A focus on ZZK Records and related artists sheds light on the uncertain place for independent musicians and new technologies in this picture.

From the start, ZZK's outlook was global. It was co-founded by Grant C. Dull, a North American who had previously created What's Up Buenos Aires, an English-language internet portal for the Buenos Aires cultural scene, and it particularly caught the attention of expats, hip tourists and foreign journalists. Its early and enthusiastic adoption of social media and its aesthetic orientation towards fusions with internationally circulating forms of EDM resulted in prominent participation in the transnational networks of Global (or Tropical) Bass, the digital, club-oriented offspring of World Music (though over time its orientation shifted towards the parent genre). ZZK's artists toured regularly to Europe and the US, and collaborated with producers overseas, and the label signed a licensing deal with Los Angeles label Waxploitation in 2011. ZZK Records was thus a thoroughly, and at times frantically, transnational operation.

As ZZK's centre of attention shifted ever more towards Europe and North America, it became less rooted in the local music scene. In many respects, five years after its foundation ZZK could have been located in Bogotá, Brooklyn or Barcelona, and its location was arguably wherever Grant Dull's laptop happened to be. In order to explore wider issues surrounding music and digitisation that were more specific to Buenos Aires, I therefore broadened my research to encompass developments in cultural and digital policy at municipal, national and continental levels. The Ministry of Culture launched several new initiatives centred on digital transformations and the cultural industries, and seemed set on playing a larger and more supportive role in the independent music sector. Once again, transnationalism

[3] 'Independent' will be used here to refer to music other than *música tropical*, not released by a multinational major label.

was to the fore, and these shifting visions and policies must be understood in the context of the marked Latin American regionalism of the early twenty-first century. While many such initiatives were ultimately abortive, they signalled important shifts in the conceptualisation of the relationship between politics, culture and the digital, on the part of the Argentinean government and of the Latin American Left more generally.

The Buenos Aires music industry in the digital era

According to a report by the Observatorio de Industrias Creativas (OIC) in 2011, the Buenos Aires music industry represented a successful sector of the economy, with its total income having almost doubled between 2005 and 2009 ('La Industria de la Música' 2011). The principal reason for this success was live music, which grew by nearly 300 per cent in that period. These statistics contrasted, however, with a more uneven picture emanating from the city's independent music scenes. On 4 June 2012, the Club Cultural Matienzo hosted a debate on the topic: 'From underground to indie: industry and venues in the waiting room', which provided a snapshot of the independent music sector at the time. Participants complained of small audiences, a lack of venues and meagre earnings. The alleged cause of this difficult situation was new technologies: the internet was seen as a rival to live music, responsible for an excess of music and a dearth of audiences. One older musician quipped that if his generation wanted to hear music and meet girls, they used to go to gigs; now people stayed at home with YouTube and chat. The messages conveyed by the panellists were: work hard, lower your expectations and question whether you are good enough. It was hard to imagine that the audience went away with renewed hope.

A closer reading of the OIC report reveals two important findings that support the more negative mood seen at the debate. First, the growth of live music covered up a big drop in the sales of physical formats, yet the drop had not been offset by rising digital sales, which accounted for just 7 percent of total music sales in 2009, compared to a Latin American average of 15 per cent ('La Industria de la Música' 2011, 45–6). The report concluded that 'the digital market is not being consolidated in Argentina' (2011, 42). Furthermore, the limited digital sales were concentrated among overseas consumers and fans of Top Ten artists, meaning there was almost no local digital market for independent music.

Digital distribution initiatives by Argentine record and telecoms companies had been broadly unsuccessful. There had been several attempts to launch portals, from 2005 to 2007, but none had prospered and some had closed again. There were six portals active in 2010, but the number of users appeared to be low. The failure of Zap Música, launched in 2005, was emblematic: despite major investment from the cable company Fibertel, the portal achieved only derisory sales *(never exceeding $400 a month)*. The mobile music market was also slow to take off in Argentina and, at least initially, had a negligible effect on the independent music sphere, since mobile phone operators focused on selling a small range of current hits. iTunes launched in Argentina in 2011, but only 0.5 per cent of the population used it in 2013 ('Encuesta Nacional' 2013).

With the pay-per-download model showing few signs of promise, commercial attention shifted to streaming. Multinational services Grooveshark and Deezer launched in Argentina and 2012 saw the creation of the Buenos Aires-based Taringa! Música. Its parent company,

Taringa!, founded in 2005, was not only a highly successful social network but a prime source of links to free downloads of music, films and books and the first stop for music producers in search of pirated software, samples and plug-ins. Initially seen as a local equivalent of Megaupload, the Hong Kong-based file hosting service shut down by the FBI in 2012, it went through a tortuous legal process for several years from 2009. Its owners, the brothers Matías and Hernán Botbol and Alberto Nakayama, were committed for trial in 2012, charged with violating Argentina's intellectual property law by facilitating copyright infringement ('Confirman juicio oral' 2012). This was to be the first public trial in Argentina in which the responsibility of websites for the illegal actions of their end users would be debated, and Taringa! became a focal point for local debates about IP.

As part of efforts to legitimise its activities under the shadow of the impending trial, the company launched Taringa! Música, a legal streaming service. In 2012–13, it negotiated with multinational major labels, and trade and collecting societies, principally SADAIC (Argentinean Society of Authors and Music Composers) and CAPIF (Argentinean Chamber of Phonogram and Videogram Producers), and now described its aim as to become the Spotify of the Spanish-speaking world. The possibility that Taringa! Música might offer a radical alternative to the commercial digital distribution platforms of the global North receded as it backed off from a 'free culture'-esque stance under pressure to deal with major industry and legal institutions. By September 2013 Taringa!'s counter-cultural discourse had all but vanished: Hernán Botbol described a company that had attempted to respect IP norms and deal with complaints from rights holders while operating in an ill-defined legislative context, and had been unfairly treated by publishers. [4]

Late 2013 also saw a major blow for Taringa! Música—the arrival of Spotify in Argentina. While the Argentinean company had been embroiled in drawn-out negotiations, it had been outflanked by an international competitor and its moment had passed. Features of Taringa! Música that had been innovative when it was conceived were now commonplace on multinational services like Spotify and SoundCloud, and a combination of Argentinean fascination with foreign trends and the negative associations of the Taringa! brand put the local alternative at a disadvantage. Furthermore, Taringa!'s directors, observing the finances of multinational services, became less convinced by the idea of music streaming as an economic venture. With Taringa! Música just one part of a larger enterprise, and a problematic one at that, the directors shifted their attention to other areas, redesigning the portal as a source of information for news media. Taringa!'s attempts to improve its image had been largely successful—by agreeing to publishers' demands, it had ensured that the legal case against it was all but dropped ('Otro querellante' 2014)—but the sense that its music service might challenge multinational enterprises had passed. In 2013, only 3.8 per cent of the population used it to listen to or download music, compared to 27.5 per cent for the peer-to-peer service Ares and 14.4 per cent for YouTube ('Encuesta Nacional' 2013). With none of these services generating direct income for independent musicians, there was no immediate sign that digitised music would provide a financial lifeline to the independent music sector.

The second important finding of the OIC report was that 80 per cent of live Argentine music revenue came from stadium concerts. The local music industry thus depended heavily

[4] http://lic.cultura.gob.ar/foros-de-cultura-digital. No longer available.

on big-name acts, particularly international stars. Accounting for 90 per cent of the concert promotion market in 2012, the promotion and production companies T4F-Time for Fun, Fénix and Pop Art—rather than digital content providers—emerged as the primary actors of the music industry in the digital era ('El background' 2012). Many large concerts were sponsored by major brands and the early 2000s saw the rise of sponsored festivals such as Pepsi Music Festival (originally Quilmes Rock, founded in 2003) and Personal Fest (from 2004). The music industry boom thus exemplified the continuing concentration and corporatisation of the cultural industries, a process noted in the 1980s (Hesmondhalgh 2012) that has only intensified under digital conditions. In Argentina, as in the global North (Netto 2012), music was generating capital at an industry level above even that of the multinational major labels, with its value now lying primarily in its capacity to sell the products and services of the consumer electronics and telecoms industries.

The propitious local conditions for international rock stars were highlighted when Roger Waters sold 372,550 tickets for nine shows as part of his 'The Wall Live' tour, making the River Plate football stadium the second most important open-air venue in the world in 2012 from the perspective of ticket sales (Kantor 2013). Waters personally earned $15.7 million, illustrating how Buenos Aires' '2.0' music industry was primarily benefitting the same musicians who thrived under the '1.0' version, with profits concentrating at the top end of the live music industry. The digital era saw Buenos Aires experiencing a form of rock imperialism from the global North, boosted by the recession in Europe ('El background' 2012). Argentina's large rock fan base provided a receptive audience: 'The high demand for tickets makes Buenos Aires one of the most important markets on the planet', claimed Waters' agent (Kantor 2013).

This was a promising picture for transnational corporations and international stars, but less so for local independent musicians. Indeed, the OIC report noted 'impoverishment of the local, alternative scene' ('La Industria de la Música' 2011, 47) as fans' expenditure was drawn away from mid-level local artists in favour of international touring acts. Exacerbating the problem was a shortage of suitable small- and medium-sized venues, after a fire at the nightclub República Cromañón in 2004, which killed nearly 200 people, led the city government to close locales and tighten licensing practices. A decade after the tragedy, the city government continued to shut down small-scale cultural centres.[5] Independent musicians and promoters lamented the lack of performance spaces, the bureaucratic hurdles to creating new ones, the prevalence of shady practices in existing ones, and the struggles simply to break even (see also Totah 2014). One, DJ Relo, explained how he had founded Sub Klub netlabel as a response to the declining opportunities for live events; the internet provided an alternative outlet for his musical energies and an escape from the problems of the urban environment. Independent musicians thus found themselves in a double bind: declining sales of recordings raised the importance of live performance, yet the urban infrastructure and restrictive regulations conspired against it.

Independent labels were unsurprisingly downbeat in their outlook. Their problems were a decade old, to judge from an OIC report in 2004 that asked: 'How do small and medium independent labels survive, if even in an optimistic scenario the profits made from recording and releasing records are practically nil?' ('La industria del disco' 2004, 74). The first answer

[5] http://leymeca.com.ar. No longer available.

was that many labels had not survived. Those that had were increasingly distancing themselves from content creation, tending more towards licensing existing music. At a debate at the cultural industries trade fair MICA in 2013, one label owner proposed dropping the first word in the term 'record label', since labels rarely made records anymore. Another claimed that small labels were increasingly operating as a service industry, offering distribution to musicians for a fixed fee; some did not even have their own catalogue. He suggested that there was little investment in music at any level of the industry since it was simply no longer profitable to produce music in a studio.

If digital optimists have argued that the internet is democratising the cultural industries (see Hesmondhalgh 2012, 313–21), these independent label owners were more sceptical, pointing to their straitened circumstances and those of their musicians. One asked rhetorically: 'Who is going to protect us in this monstrous digital world, abandoned to the market as it is, perhaps more so than the record industry ever was?' Nicolás Falcoff, owner of the independent label Sura, claimed that there was 'a hyper concentration, a hyper monopolisation hiding behind the curtain of the democratisation of content on the internet'. Major corporations were profiting handsomely while 'those who are losing the battle are the content producers'. He described corporations as acting like parasites on cultural producers rather than investing revenues back into new production, resulting in the concentration of profits—a view echoed by academic reports on the global industry (for example Leurdijk and Nieuwenhuis 2012, 10). The evidence from Buenos Aires that revenue was not trickling back down to the independent music sector in a consistent way was echoed elsewhere: Solís (2010) reports a similar scenario in Santiago de Chile, while the Digital Music Report (2011, 22), describing 'the squeeze on the smaller players' around the world, provides a downbeat picture of losses and declining investment in artists on the part of labels in the UK and Mexico as well as Argentina.

The production of stasis in the Buenos Aires music economy

According to the Club Cultural Matienzo debate, the independent industry was 'in the waiting room'—a phrase that captures the sense of inertia and uncertainty in the sector at that time. One factor behind this stasis was the slow development of a digital music economy in Argentina. This in turn relates to the lack of credit card penetration and confidence in online transactions, in part a consequence of the central role of banks in the 2001 crisis and thus a limited culture of e-commerce. Moreover, not least thanks to Taringa!, there was a deeply rooted culture of free downloading, which was considered 'cool', according to Zap Música's former director: 'Buying in Zap Música was not cool. You were stupid if you bought it, because you could go to many sites and download it for free. So why pay?' The culture of internet use in Buenos Aires combined widespread access and high technological literacy with a disinterest in paying for digital content and pervasive 'free culture' practices. In 2012, the US-based International Intellectual Property Alliance (IIPA) painted a picture of high rates of piracy and low enforcement, and kept Argentina on its Priority Watch List (Argentina 2012). The IP activist Lila Pagola (2010, 40) wrote: 'We are copyleft avant la lettre, simply because if there were not a generalized practice of unauthorized copying and peer-to-peer sharing, the majority of us would not have access to cultural goods.'

While Argentineans' reluctance to buy digital content dampened optimism about the future of digital distribution, institutional forces must also be taken into account. The multinational major labels, the local collecting and trade societies SADAIC, CAPIF and AADI (the Argentinean Association of Performers) and the mainstream media formed a close and collusive bloc which had historically exerted a strong hold over the music industry. Many interlocutors traced the stasis in the digital music field to the attitudes and actions of these dominant players, which were widely regarded as having taken a conservative line with regard to emerging digital conditions: slow to react and fighting to defend their territory rather than adapting.

During the 1990s, the majors bought up large independent labels, as they did across Latin America (Ochoa and Yudice 2002; 'Valor y símbolo' 2010, 86). According to the OIC's 2004 report, the majors had 82.6 per cent of the national market, giving Argentina the second highest penetration of foreign capital in Latin America ('La industria del disco' 2004, 46). In 2010 the majors had 80 per cent of the record market and 90 per cent of the top-selling albums in Argentina ('Valor y símbolo' 2010). In the early 2000s, however, the majors streamlined their operations in Latin America (Laing 2009, 23). The 2004 report claimed that the major labels had suspended their research and development of new artists and were focusing on promoting a small number of long-established figures. The majors thus fostered a rigid and conservative star system, making opportunities for new entrants scarce. In Argentina, as elsewhere (Elavsky 2013, 105–6; Leurdijk and Nieuwenhuis 2012, 46), less famous national artists took the brunt of cutbacks as the majors reduced investment and focused on marketing global priority artists. In one analysis, a combination of the domination of the majors and the abandonment of policies in support of local industries during the neoliberal wave of the 1980s and 90s impeded the development of the Latin American music industry (Barrowclough and Kozul-Wright 2011, 21; Cunningham et al. 2011, 75). In the early 2000s, I would argue, the majors' simultaneous strength (in terms of market share) and weakness (in terms of the general decline of the recording industry) led them to take a cautious line, producing retrenchment rather than dynamic new developments. By 2012 the major record companies' Argentinean offices were increasingly diversifying into 'new business', negotiating with streaming services, concert producers and brands and transforming themselves into content and entertainment companies. Nevertheless, due to their earlier recalcitrance, they were still widely perceived as a conservative force.

Founded in 1936 and 1958 respectively, SADAIC and CAPIF, too, were commonly viewed as sources of inertia, resisting attempts to reshape intellectual property policies for the digital era and labouring over negotiations with digital initiatives such as Taringa! Música. SADAIC was commonly described as a conservative institution run by elderly men—'a white elephant' with 'a very analogue way of thinking', in the words of one senior industry figure. The same individual said of AADI: 'I talk about digital to them, and they make a very big effort, but they don't get it. They don't use it, so they don't get it.' A state cultural official described these institutions as 'the analogue sector', claiming that they made little effort to grasp how digitisation was reshaping the cultural sphere.

Relations between the major labels and the collecting and trade societies were tight: the majors dominated CAPIF (Lamacchia 2012, 142–4), while SADAIC's opaque and much criticised formula for dividing up royalty income was said to favour the multinationals. The majors also had privileged access to the mainstream media, which continued to be important

in Argentina (Becerra, Marino and Mastrini 2012, 18; 'La industria del disco' 2004, 29). Radio play was still key to music consumption ('Encuesta nacional' 2013) and industry success, and independent musicians claimed that payola was rife, making it hard for them to gain exposure. While the 2009 media law (Ley de Servicios de Comunicación Audiovisual) was supposed to redress this balance by stipulating a quota for local independent music, the digital era had not yet seen a significant shake-up of the main players of the Argentinean recorded music industry, whose continuing collusive dominance left limited space for innovation.

If the institutional panorama was dominated by defensive, analogue-era organisations, institutional and political divisions also contributed to the production of stasis. The national and municipal cultural industries offices were run by opposing political parties and pursued divergent policies, while the major labels had limited connections with these offices and the independent sector. The majors operated to a significant degree as a separate sphere, their institutional line and much of their catalogue determined overseas. Such was the separation between the majors and the rest in neighbouring Brazil that Howard-Spink *(2006)* argued that there were effectively two recording industries. In sum, Buenos Aires sustained a fragmented and contested music sector, and as the fate of Zap Música and Taringa! Música confirmed, this was an unpropitious setting for aspirant digital music entrepreneurs.

ZZK Records and digital cumbias

ZZK Records, founded by Grant C. Dull, Diego Bulacio (aka Villa Diamante) and Guillermo Canale (aka DJ Nim), began life in 2006 as a weekly club night, coalesced into a label in 2008 and by 2011 had evolved into an integrated management and production company housing nine artists plus the three founder-DJs. Its parties brought together laptop artists interested in fusing Latin American musics with international genres like techno, dancehall and dub. It coined the term 'digital *cumbia*' for its signature sound, an EDM-tinged version of the Colombian genre adopted by Argentina; but a number of ZZK artists showed equal or greater affinity for Argentinean folkloric musics.

ZZK's artists had considerable interest in national and continental traditions, yet they and their audiences were primarily middle- to upper-middle-class cosmopolitans with a notable orientation towards the global North. The scene that coalesced around them amounted to a 'culture of circulation' (Baker 2015a; Lee and LiPuma 2002). Two of its foundational figures were a Dutch conceptual artist and musician, Dick Verdult aka Dick el Demasiado, and a North American DJ, Gavin Burnett aka Oro11. Dick el Demasiado's Festicumex (Festival of Experimental Cumbias) in 2003 was a prime catalyst, and Burnett, who spent an extended period in Buenos Aires in the early 2000s, further opened the ears of upper-middle-class tastemakers to fusions of *cumbia* with hip hop, dub and reggae. ZZK cofounder and manager Grant Dull had previously cofounded the website What's Up Buenos Aires (WUBA), aimed at connecting foreign audiences with the Buenos Aires cultural sphere. The scene was thus initiated by the circulation of foreign musicians through Buenos Aires, consolidated by a North American cultural entrepreneur and 'ignored by most locals but eagerly embraced by first-world expats living in Buenos Aires'.[6]

[6] http://latinbutcool.blogspot.co.uk/2008/03/enter-cumbia-phenomenon.html Invitation only.

I was originally attracted to study ZZK Records because of its international renown but also because it seemed to embody a cutting-edge, distinctively digital enterprise. Like many ethnographers of the digital, I faced fundamental challenges when I began fieldwork, such as where and what to study. ZZK artists played prestigious festivals and the label was covered by international media outlets, yet its impressive web presence contrasted with a local operation that consisted largely of Dull, his assistant Allie Silver, and their laptops. For much of my fieldwork ZZK did not have an office and work often took place in living rooms, bedrooms and cafés. Dull would spend much of his day networking digitally with the outside world—writing and answering emails and posting news, videos and music on social media. As a result, ZZK and its technologically savvy musicians became a key point of reference for the transnational Global Bass scene. Paradoxically, though, their local presence in Buenos Aires was far more modest.

Digital *cumbia* was more coherent on the internet than in the online world. Emerging from different points in Latin America in the early 2000s, its central nodes became Facebook or SoundCloud groups like 'The New Cumbia Makers' and blogs like 'Generation Bass', 'Nu *Cumbia* Experience' and 'Cassette Blog'.[7] If more traditional forms of *cumbia* were the soundtrack to countless large dances every weekend, digital *cumbia* was surprisingly elusive on the streets of Latin American cities and primarily inhabited online spaces.

ZZK was indeed a highly digital enterprise in 2011–12. It had a colourful website and its artists were assiduous users of social media.[8] They made mixtapes—consisting of their own unreleased tracks, their remixes of other artists' work and others' remixes of theirs—which the label distributed for free on its website.[9] As well as disseminating current information, Dull often filled quiet news days with retrospective posts—old videos of key performances from the past, for example—thereby constructing and reinforcing a sense of institutional history. Though remaining a niche label, ZZK created a transnational fan base via the internet and its artists communicated extensively with listeners and other producers, both locally and overseas. While Buenos Aires' musical culture has been notably transnational for centuries, its circulatory flows and international profile were much intensified by the internet.

At the same time, with industry developments moving fast, I was obliged to reconsider my initial premise about ZZK's distinctiveness. It might have been an accurate assessment earlier in ZZK's history: Dull had contacts and a knowledge of social media that helped bring ZZK's parties and then the label to international prominence in its first phase. But by 2012, to describe ZZK as a distinctively digital enterprise seemed increasingly meaningless. After the rapid international spread of a handful of dominant platforms, there was now little that distinguished ZZK's digital tools and strategy from those of myriad other independent labels, both locally and overseas. The intensification of circulation enabled by the web promoted certain kinds of standardisation on the web, which was further reinforced by the proliferation of homogenised, user-friendly internet tools; online presentations of self were thus increasingly similar.

What was striking about ZZK by 2012 was less its digital practices than the fact that its artists were starting to turn away from their original one-man-and-his-laptop formula and instead constitute ensembles, incorporate 'real' instruments and play down sampling. By this point, with digital technology now so commonplace in Buenos Aires, what was distinctive about ZZK was less a digital ethos than a post-digital one (Baker 2015b). The prefix 'post-' signifies modification, self-reflexivity and critique rather than rupture, since digital technology continued to be widely used. If there was a temporal aspect, it described a putative moment after digital saturation, a state of affairs evoked by Villa Diamante's 2009 mash-up album *Empacho digital* (Digital indigestion).

Most of ZZK's artists came from an EDM background and in ZZK's earlier phases, the digital had played an important role in mediating cumbia for the upper-middle class, who had historically viewed this genre as vulgar for its strong association with the 'popular' classes. Digital fusion enacted a class move, making this music not just acceptable but positively hip. However, as *cumbia* gained space among the middle classes, a process that accelerated with the appearance of middle-class 'traditional' *cumbia* orchestras from around 2009, several ZZK artists began to see their music-making as a personal journey into Latin American traditions, one that involved more sparing or self-critical use of new technologies and deeper engagement with old ones. Consequently, the laptop lost some ground to traditional instruments and a more conspicuously live aesthetic. Whereas in the peripheral Mexican city of Tijuana, the digital fusion musicians of the Nortec Collective aspired to modernity and cosmopolitanism (Madrid 2008), ZZK's artists were based in a capital city that had long been one of the most modern and cosmopolitan in Latin America. Their search was in the opposite direction: an inward turn, towards a different kind of connectedness, in this case to indigenous cultures and to nature. If, according to Alejandro Madrid, Nortec's 'savvy' musicians were driven largely by career and economic concerns and approached local culture through the prism of kitsch, ZZK's were more serious, even romantic, in their efforts to study Latin American traditions and merge them with urban cosmopolitanism, and this increasing engagement with such traditions entailed rethinking their relationship to digital technologies.

Initially, the computer had been central to ZZK's aesthetic; now, five years later, it was being literally and figuratively moved into the background whenever possible. Leo Martinelli started out working solo with a laptop, and then added two musicians (playing analogue synthesiser and acoustic drum) to form Tremor.[10] Chancha Vía Circuito started by sampling indigenous music on his computer; then he remixed a traditional song, 'Pintar el sol', sung by Miriam García and Alicia Solans, for his album *Rio Arriba*; finally he started taking folkloric music lessons with García.[11] The two musicians eventually performed together in public, singing duets—including 'Pintar el sol'—accompanied only by hand-held frame drums.[12] In 2011, El Remolón, also a solo laptop artist, added three musicians to form El Remolón y Su Conjunto, and he launched his albums *Boxeo Constitución* (2013) with a seven-piece ensemble and *Selva* (2014) with an acoustic set.[13] ZZK's newest and highest-profile signing, La Yegros,

performed with a full band; a laptop was tucked discreetly away at the back. The last three artists were now capable of performing without laptop and even without electricity.

For such artists, musical evolution or progression involved a kind of technological regression. Digital technology, rather than being the end point of a development from tradition to modernity, and from acoustic to analogue to digital, served as a starting point for a journey back to roots—from the modern to the traditional, the foreign to the local, the electronic to the acoustic—and from solo to interactive music-making. Villa Diamante's phrase 'digital indigestion' sums up a scene in which artists, while continuing to use digital technology, were developing increasingly critical perspectives towards it, ever more aware of its limitations as well as its advantages.

ZZK's post-digital shift had multiple causes. One was the emergence of a research ethos that bordered on amateur ethnomusicology or anthropology. Having begun by sampling folkloric music, several artists became more interested in their sources and saw learning to play or sing this music as a logical next step in their musical development, even travelling to other parts of the continent to hone their skills and collect music and instruments. They sought a more direct experience than sampling—playing the music themselves or working with musicians who did. This turn to sources was underpinned by the growing identification with Latin America on the part of Buenos Aires' traditionally Eurocentric middle class in the post-crisis period. Another reason for this shift related to copyright. After signing a management deal with Los Angeles-based Waxploitation in 2011, ZZK's releases had to comply with US copyright law, which meant all samples had to be cleared legally. The complexity and expense of this process meant that artists subsequently preferred to play or sing the music themselves, or expand into a band format. A third factor was the increasing economic importance of live performance (and thus of a sense of 'liveness') in an era of declining sales of recordings. A band format was considered more appealing to audiences and bookers, particularly in the crucial European summer festival market (see below). In sum, ZZK's 'early adopters' had developed a more complex relationship with the digital by 2012. A post-digital frame underlines this evolving vision and treats the enthusiastic embrace of the digital as a historical phase rather than an end point.

The economics of ZZK Records

ZZK's history was marked by a search for a viable business model. While it began as a weekly club night, by 2011–12 its live performances took place only sporadically. Its events rarely generated significant income and sometimes operated at a loss. After several years, ZZK's founders were no longer willing to invest the necessary time and energy in unprofitable live shows. Dull reported: 'How does a label survive month to month? It doesn't. That's the answer. We added up all the money we have coming up from local shows. It's a quarter of the money that we need to keep the label going in Argentina.'

From the start ZZK had an international orientation, organising tours in North America and Europe. These tours generated international publicity, but again they produced little in the way of profit, particularly as some artists had to take time off from day jobs. One early European tour earned the musicians around €400 each. Though there were occasional well-paid gigs and earnings rose as artists became more established, such musicians repeatedly

described overseas touring as more about promotion, contacts and personal interest than income. A commonplace assumption in the digital era is that musicians invest in recording in order to profit through touring; but touring may be characterised as much by investment as revenue generation, illustrating a process of constant deferral of economic rewards (Johnston 2012). The gains of touring are often immaterial, taking the form of cultural and symbolic rather than economic capital. ZZK's directors and investors were clearly frustrated by the disjuncture between prestige and financial returns.

Some of ZZK's albums received very positive reviews in the international press, with NPR proclaiming at the end of 2011 that 'Mati Zundel is about to become a household name among music lovers in the US'. Actual sales of his album *Amazónico Gravitante* were low, however. ZZK's album sales brought in a steady trickle of income, but not enough to provide a solid platform for the business, and even investment in overseas marketing by Waxploitation made little impact on this picture.

With ZZK struggling to generate significant revenue from live music and recordings, it looked increasingly to other sources. While commissions to remix other labels' or artists' work—such as *La Revancha en Cumbia*, an album of remixes of Gotan Project's hugely successful 2001 album La Revancha del Tango—brought in additional income, the key to survival was synchronisations (syncs).[14] Indeed, ZZK decided to license its catalogue to Waxploitation in the hope of capitalising on the latter's contacts and securing syncs with films, TV shows and advertising in the US. Syncs for a Mati Zundel track on an Aerolíneas Argentinas advertisement and for a Frikstailers track with K-Mart brought in five-figure sums in 2012–13, providing a crucial lifeline to both artists and label. Two Zundel tracks, 'Por el Pueblo' and 'El Alto de La Paz', were synced to the TV programme 'Homeland' in 2013, and La Yegros' song 'El Bendito' was synced to the video game 'EA Sports 2014 FIFA World Cup Brazil'.[15] Nevertheless, placing syncs at the centre of financial strategy was risky. 'It's like waving a wand', admitted Dull. 'You can't depend on it. It's a one in a million shot.' Zundel's first sync came about after a friend of Dull's picked up the track from Facebook while 'messing around' with the preview of a commercial that he was making.

Chancha Vía Circuito's experiences illustrated the rewards and challenges of looking for syncs. In 2012, he looked set to license a track to a major US TV show, which would have constituted his and ZZK's biggest financial coup to date. The deal fell through at the final hurdle, however, because the transnational media corporation behind the show insisted on the artist signing away DVD rights, and while both he and ZZK were willing to comply (believing that the fee and TV royalties justified the agreement), SADAIC refused to sign off the agreement, arguing that it was exploitative. A year after this major blow, however, Chancha secured a sync on the hit US TV show 'Breaking Bad'. The song soon had half a million hits on YouTube.

Dull described the first Zundel sync as 'literally the salvation of our year', underlining just how fragile the company's finances were, despite its international reputation. Indeed, when I first contacted Dull, he replied:

> Ninety per cent of what you see ZZK doing I run from my humble apartment/HQ … Survival is as important to us as growth is right now. Ship constantly sinking. Then floating somehow … Don't let the fancy graphics and world tours fool you, we're in constant crisis and hustling like crazy to keep it going.

ZZK's predicament underlined the difficulty in converting intangible assets like prestige, which are relatively easy to acquire in the era of social media, into economic sustainability. Dull's day-to-day struggles made the challenges for independent labels abundantly clear. Thanks to digital technologies, starting a label was easy—but making it economically sustainable was a different matter. In our final interview, Dull began: 'Just write the chapter now—it starts with "We're broke, period".' Later on he recounted a conversation with Jeff Antebi at Waxploitation: 'We asked him yesterday, when does ZZK start to make money? The answer was, maybe never. And it's true. Labels are honestly … I don't know how they exist.'

As Ochoa and Botero (2009) observed in Colombia, they exist through a mix of economies of sacrifice, gift and exchange, alongside more standard industry models. Dull argued that the informality of Buenos Aires' economy meant that a considerable amount of work could be done through favours from friends, at discounted rates, or in exchange for a reciprocal service. ZZK was also cross-subsidised in various ways by its directors' portfolios of activities, and this seemed to be typical for small independent labels (see also Strachan 2007). Dull reported, 'I don't think any of the small or designer labels are making money. I think they do it because they love the music—first and foremost that's the reason I do it too—and they all have other jobs.' Dull continued to run WUBA and took on other marketing work; Villa Diamante had a successful DJ career; Nim ran a graphic design business.

Most musicians that I met cross-subsidised their art from other activities—a scenario typical of independent musicians in other countries (see Frith, Cloonan and Williamson 2009; Madrid 2008; Woodside Woods, Jiménez López and Urteaga 2012; Pereira de Sá and Oliveira Miranda 2012). Among ZZK and similar artists, some opted to cross-subsidise from other kinds of musical activity (and therefore live predominantly from music), while others preferred to work in a completely separate field (and thus keep their art 'pure'). DJing and music teaching were the most common choices. Frikstailers, Leo Martinelli and Axel Krygier wrote music for advertising and films, Gaby Kerpel (King Coya) for theatre (including De la Guarda and Fuerza Bruta), Daleduro for video games and Catnapp for gyms. El Remolón was a psychiatrist, while close ZZK collaborator Miss Bolivia has worked as a psychologist, yoga teacher and journalist.

Despite their limited income, many musicians displayed a non-profit brand of entrepreneurialism. An alternative or countercultural ethos was widespread in the city's independent music scenes, which drew on a historical anti-establishment vein in independent rock. This genre was strongly associated with resistance to the military dictatorship in the 1970s and 80s, and there remains today a nostalgic attachment to this 'golden age' of *rock nacional*. With the 2001 crisis, neoliberal capitalism was widely discredited and new social movements strengthened, consolidating a countercultural outlook among many young, middle-class

Argentineans. The independent popular music sector was thus traversed by the ideologies of post-neoliberal new social movements as well as independent rock, producing a cultural field in which corporations were often viewed askance, independence was valorised and anti-establishment or hippy subjectivities were commonplace.

ZZK Records was a case in point. Its two Argentinean directors were open about their dislike of the business aspect of running a label. Several of ZZK's musicians were uncomfortable with the label's partnership with Waxploitation, despite the latter's international prestige, because it obliged the label to become more business-like. ZZK Records generally styled itself as a collective, having emerged from a tightly-knit underground scene and a club night in which musical collaborations were encouraged. Villa Diamante described its defining characteristic as '*buena onda*' (good vibes), insisting that it prioritised collaboration and the collective good: 'The truth about the label is that … we never thought about it as a way to make money, but rather as a way to … join forces with artists who we thought were interesting … When you see the whole business structure of ZZK and compare it with a real business structure, it's not a business, it's something else, it's a cooperative'.

Villa Diamante and three partners opened the record shop Mercurio Disquería in 2012. His aims were twofold: to support the local independent music scene and not to lose money. Rather than supplement his meagre earnings from ZZK, he deliberately took on another unprofitable venture. He took a certain pride in recounting his counter-intuitive decision to open a record label when record labels were going out of business and a record shop when record shops were closing down. Meanwhile, digital musicians joined online groups like New Cumbia Makers and produced and uploaded their music for free, or created netlabels like Cabeza and SubKlub, or started online radio shows; more than generating profit, these activities required investment. Digital technologies allowed artists to inhabit the music scene in a variety of roles but also with a variety of relationships to the business of music. In the Buenos Aires independent scene, there was a vein of digital amateurism that saw individuals actively opting for non-monetised or non-profitable musical activities and accumulating cultural and symbolic (more than economic) capital in the form of internet likes, plays and free downloads. They were critical of entrepreneurialism when oriented towards business, yet engaged with it enthusiastically in small-scale enterprises with a non-profit ethos.

Disintermediation? ZZK in transnational context

Grant Dull described the birth of ZZK Records as almost an accidental move by three inexperienced friends. However, consolidating the enterprise had required them to engage with the established music industry in the global North and to learn to play by its rules. 'New technology, old structures' was his pithy summary and a corrective to a digital utopianism that fails to account fully for the maintenance of many elements of the 'old' music industry and the resources required to engage with them.

Economic opportunities for 'global' genres were still concentrated in the World Music industry and above all summer festivals, especially those in Europe, which were the growth area of the World Music market (Laing 2009, 28). Ambitious Latin American artists and labels like ZZK targeted this circuit, and securing enough dates to put on a European summer tour was a prime ambition and measure of success. The newer Global Bass scene thus appeared

to serve more as a gateway into the structures of the old industry than a replacement (Marshall 2010). If ZZK started out as a collective of independent laptop artists, a characteristic digital-era phenomenon, its biggest success was provided by La Yegros, a singer backed by two songwriters and a full band whose sound might be characterised as folkloric music given a contemporary flavour with digital beats and effects. La Yegros' breakthrough occurred when her single 'Viene de Mi' was heavily rotated on the French station Radio Nova, resulting in her signing to EMI France in 2013 and touring Europe with her band—hardly a distinctively 2.0 picture.[16] The following year, Dull pointed to her three-month, fifty-date summer festival tour as evidence that her career had taken off (Erbar 2014). However, other musicians from the digital *cumbia* scene noted drily that her success represented a backwards step: from the figure of the experimental electronic music artist to that of the old-fashioned World Music star.

There were also signs that ZZK's self-presentation had shifted somewhat. In the trailer for a documentary about 'Viene de Mi', the label's signature digital technology was nowhere to be seen, replaced by traditional drums and exotic-looking costumes.[17] At Womex in 2012, ZZK described itself as 'reviving Latin American folkloric traditions through an electronic pulse', a subtle reversal of emphasis for a collective whose roots lay primarily in EDM. Despite its initial digital focus, ZZK's biggest coup was via the artist who was furthest from its laptop-music roots and adhered most closely to the old World Music industry's aesthetic paradigms, and the label's updated self-framing suggests a recognition that the surest route to success lay in deferring to old structures rather than stressing new technology.

ZZK's experiences suggested that disintermediation—the marginalisation of middlemen, as musicians use the internet to take more control over their work—was less marked than is sometimes supposed (e.g. Cottrell 2010, 19). If some traditional middlemen were indeed declining in importance, others, such as bookers, promoters, agents and publicists, were rising; the field of intermediaries was thus being reconfigured rather than removed (Baym 2010). For example, a small label owner, Pablo Martín Fernández, explained that he had to go through an aggregator like Tunecore or CD Baby in order to place his music on Spotify or iTunes. Many independent musicians did not understand the process, so they turned to people like him to help them. He thus saw a proliferation of intermediaries, with three filters (Fernández, Tunecore, iTunes) between musicians and their audiences. Meanwhile, for many artists from the global South with international ambitions, industry rules had not changed substantially: while they availed themselves of the new digital tools for publicity and marketing, they also needed the services of agents in the global North in order to insert themselves into established commercial circuits—new technology *and* old structures.

Evidence from Argentina thus supported Rogers' (2013, 151) contention that disintermediation is a limited phenomenon since 'the process of breaking an artist on a wider stage remains largely filtered through many of the same channels as in the pre-internet era.' The challenge facing musicians was less producing or distributing music than promoting it and booking gigs. Dull argued: 'To give great shows, you need a great agent and you need a great management team.' ZZK worked with a complex network of intermediaries on three continents. To break into the US or European market it needed to have the ear of promoters and journalists; agents and publicists—traditional intermediaries who already had the attention of

[16] https://www.youtube.com/watch?v=WtsjrvwqIr0. Accessed 9 January 2022.

[17] http://vimeo.com/68851466. Accessed 9 January 2022.

these key players and could provide privileged access to old industry networks—were therefore important. At its own cost, ZZK attended major international trade fairs like Womex and SXSW, looking to network and impress industry intermediaries such as European and North American promoters and bookers looking for acts. A key part of Waxploitation's investment in ZZK was temporarily to pay $3000 per month to a press agency in the US, illustrating the kind of real money moving around behind the digital free-for-all of social media.

While it is undeniable that musicians have greater opportunities to take control over their careers than in the past, they are also taking on more tasks (Leurdijk and Nieuwenhuis 2012, 63). In the music business, as in the wider 'creative economy', labour, costs, risks and pressures once assumed by institutions are now increasingly outsourced to individuals, dressed up as flexibility, independence and control. Among my interlocutors, younger musicians with few attachments or responsibilities often enjoyed this freedom, but those who were a little older were generally more ambivalent about their enforced conversion into self-managers. Digital tools added an additional layer of activities and responsibilities on top of the old machinery, a slew of new demands in terms of online presence and self-promotion. Two ZZK artists, Chancha Vía Circuito and Mati Zundel, ruminated about quitting the music profession in 2014, such was their distaste for the work of self- management. For all the talk about cutting out the middlemen, there was some nostalgia for them once they were gone.

In the face of such pressures, the Argentine state began to intervene and its actions suggested that changes in the nature of musical work in the digital era had the potential to alter the very conception of a musician. In 2013 the Ministry of Culture decreed that a cultural producer now also had to become a *gestor cultural* (cultural manager or promoter). One of the main aims of Recalculando, a state programme discussed below, was to teach musicians to *gestionarse* (manage themselves) and thereby convert them into *gestores*.[18] That the very word 'musician' was coming under pressure suggested that important changes were afoot, although their significance was ambiguous. In the global North, where musicians are increasingly expected to see themselves as small businesses—to acquire managerial skills and manifest self-promoting desires—such shifts are usually attributed to neoliberal 'creative economy' paradigms.[19] The *gestor cultural* discourse in Argentina might have evidenced the penetrative power of such globally circulating frameworks. Yet self-management also had a distinctive local history, one with a much more collective bent, which was being reanimated in the period of ascendance of the internet. Cooperative and self-organisation movements emerged in Argentina in the mid-1990s precisely as a critical response to neoliberal conditions and blossomed with the 2001 crisis provoked by neoliberal policies (Brand and Sekler 2009, 61–2). Self-management was thus associated locally with workers collectively occupying and taking over capitalist enterprises. Given the leftist valence of this idea in recent Argentinean history, the language of *gestores culturales* had a post-neoliberal flavour and the self-management in question was partly a matter of taking fuller advantage of increased opportunities provided by the state (described below).

[18] See, for example, http://www.youtube.com/watch?v=WyQG-UwgIVQ. Accessed 9 January 2022.

[19] This was one theme that emerged from the conference 'The small economies of the "new" music industry', University of Bristol, 25 March 2013.

Other digital cumbias

Although ZZK coined the term 'digital *cumbia*' for its particular brand of fusion, other currents of laptop cumbia emerged in Buenos Aires. The genre was thus internally diverse. Around the turn of the millennium, and well before the first ZZK party, DJ Taz, DJ Yankee and the legendary *cumbia villera* musician Pablo Lescano fused cumbia, EDM and dub in a project called Su Majestad La Cumbia, and while the group did not last long, DJ Taz attempted a comeback in 2012 alongside two young former disciples, Negro Dub and Che Cumbe, who had been organising large dances under the name of Colombia Fest. Their primary audience was a subset of the 'popular-class' public at the large weekend *bailantas* (dances) that are the mainstay of the tropical music industry, and their dub versions of Colombian *cumbia* appealed mainly in the Zona Norte (the peripheral northern zone of greater Buenos Aires) where Colombian music is particularly appreciated.

In 2011 an important new subgenre emerged from the commercial *cumbia* industry, epitomised by Los Wachiturros, a group with a highly digital aesthetic that mixed elements of *cumbia*, *reggaetón*, EDM and dancehall. A raft of similar *música turra* groups soon appeared, appealing mainly to younger listeners (above all teenagers) from the popular classes in the Zona Sur (southern zone). The musical elements of *música turra* were similar to those of ZZK, but the way they were used was quite different: whereas ZZK's artists often strove to experiment with and transform these features, *música turra* producers tended towards repetition of a limited palette of generic sounds, aiming to appeal to fans of mainstream *cumbia* and *reggaetón* rather than the alternative electronica and rock scenes to which ZZK was oriented.

Música turra's sound was new, but its economic model came from its predecessor, *cumbia villera*, which had emerged in the late 1990s (Magariños and Taran 2009).[20] In *música turra*, recorded music was distributed freely by any means available in order to drum up interest and the money was made at the gate of the large weekend *bailantas*. The most successful artists might perform short sets at numerous *bailantas* in a single night. Unlike ZZK, *música turra* derived significant income (fees and royalties) from live performance, the large fanbase for commercial *cumbia* and the centrality of *bailantas* in the leisure activities of the popular classes making this model financially viable.

The director of JR Producciones, a leading *música turra* production company, had a gold disc by one of his artists, Macho y El Rey, framed and mounted on the wall of his office in classic music-industry style—but this was really about appearances rather than sales, he admitted, since they gave most of their CDs away. Forms of distribution included TV, radio, informal CDs and increasingly the internet (via specialist *cumbia* websites). But *música turra* also embodied the innovations associated with Web 2.0. By uploading their music to YouTube and social media these entrepreneurs encouraged listeners to engage not only in consumption but also in collaborative and participatory practices. JR Producciones' music producer, KR Pro aka DJ Krass, uploaded not just completed tracks but also their constituent parts and broadcast their availability via Facebook, encouraging other producers and audience members to remix the tracks, thereby making the originals more widely known—which in turn translated into greater demand at *bailantas*. Moreover he urged other DJs to publish their

[20] It also echoes the model of digital urban music scenes in Brazil (Howard-Spink 2006; Pereira de Sá and Oliveira Miranda 2012).

remixed versions on the internet or CDs: as he told me, 'It doesn't matter what version, just that when a group plays a show, people know the song and sing it.'

The remix culture of *música turra* involved fans as well as producers. YouTube was awash with homemade remixes of Los Wachiturros' hit 'Tírate un Paso', set to videos of The Simpsons or the Mexican comic character El Chavo (with millions of views), and hundreds of home videos of teenagers dancing the song's choreography.[21] The rise of *música turra* (a term whose origins lie in the music's characteristic dance moves) coincided with the global success of South Korean K-Pop and particularly Psy's 'Gangnam Style', in which fans' imitation of choreographies played a key part in their engagement. Los Wachiturros' success had much to do with the opportunities to interact with their music—to share it, remix it, dance to it and post videos of dancing to it. *Música turra* was thus highly adapted to local digital conditions and while other, more formal and middle-class sectors of the Argentinean music industry were wrestling with pay-per-download and streaming, música turra focused on fans freely sharing music online rather than paying to own or access it. *Música turra* might therefore be regarded as a forward-looking sector of the Argentinean music industry.

Laptop *cumbia* also encompassed a third subgenre with an entirely different model: netlabels, which disdained not only the sale of digital music but also the open pursuit of commercial goals. Netlabels release digital-only albums for free, sometimes under a Creative Commons licence, constituting a 'nonprofit popular music sector' built on technological and legal changes (Galuszka 2012). Such was the growth of netlabels in the digital cumbia and broader Global Bass spheres that digital cumbia blogger John Newell (2013) was moved to remark ironically: 'I think for the first time ever there are now officially more internet record labels than there are artists and DJs. … It is an online epidemic.' Their owners often viewed the selling of music askance, unless the transaction took place directly between the artist and the buyer, and some struck defiantly anti-materialistic poses. Buenos Aires-based netlabel Cabeza began its self-presentation: 'In early 2008 Lucas Luisao and Martin "negromoreno" Moreno joined forces to shape one of the least profitable projects on earth.'[22] Another digital *cumbia* blogger, Cumbiónico (2012), writing about two Latin music netlabels, proclaimed: 'Showing oneself free to distribute music for free, as the Rebel Sounds + Latino Resiste people do, is a radical form of protest against the capitalist model of cultural production.' Buenos Aires artist Catnapp released an EP on Caballito netlabel called *No Money Whatever*. On the cover she holds a fistful of fake money displaying a cat's head, again foregrounding the decommoditisation of her music. A netlabel is thus often a labour of ideology and a statement about free circulation, one that requires investment rather than generating direct revenue. This non-materialistic trend appeared to be growing: Lucas Luisao of Cabeza reported that the 'competition' between netlabels had increased markedly since 2008. (There is of course an irony in a non-profit sector being concerned with competition.) He remarked, slightly wistfully, that the number of (free) downloads of his releases was declining substantially, now that there were more netlabels in the 'business'.

Buenos Aires netlabels like Cabeza and SubKlub released a wide variety of music by many artists, making aesthetic generalisations difficult; but their output was notably oriented to-

wards genres such as dubstep and drum'n'bass, sometimes fused with Latin American musics. Perhaps linked to their aesthetic orientation towards rapidly evolving international subgenres of EDM, netlabels were pared-down operations that offered one important advantage: speedy turnaround. There was minimal risk of a cutting-edge sound being blunted or overtaken because of a drawn-out release schedule. Tracks could be released within weeks rather than the months or years associated with, say, ZZK. Netlabels were thus closely attuned to the rapid temporality of fast-evolving contemporary digital dance music genres.

One of the main ZZK developments of 2012 was the launch of its compilation *Future Sounds of Buenos Aires*, yet the very idea of selling a compilation album arguably looked more to the past. *Música turra* and netlabels may have provided more indicative visions of the future. By abandoning the sale of recorded music and (in the case of the former) focusing instead on fans' and musicians' participatory engagement with it, *música turra* and netlabels embodied two poles—one commercial, the other anti-commercial—of current thinking about the future of music, and of music as industry, in the age of the internet. At the time, though, three different economic and aesthetic strategies coexisted within laptop cumbia as a subgenre, illustrating the fluidity of the industry, of understandings of the digital and of aesthetic practices inflected by the digital.

Cultural industries, institutions and policies

Broadening out again from digital cumbia, significant developments were occurring in the wider institutional field in 2012–13, as the state's approach to the cultural industries evolved. It was in the realm of cultural policy that the most distinctive local developments relating to music and digitisation could be observed. While fresh debates and policy initiatives were in the air, transitions into practice were limited, and most new policy directions either failed or were curtailed by the change of government in 2015. Still, given their prominent discursive presence in the cultural sector during my fieldwork, and the importance granted to them by my interlocutors, they deserve attention.

In April 2013 the Argentinean Cultural Industries Fair (MICA) took place at Tecnópolis, the government's flagship science and technology park. Tecnópolis was an educational and cultural space hosting exhibitions designed to promote a history of local technological prowess and foster a cutting-edge, scientific national imaginary, as well as serving as a venue for artistic (and particularly musical) events. Much of MICA took place in a single, open-plan, hangar-like space, which brought contrasting ideological positions into close proximity. The event was organised by the Ministry of Culture's National Office of Cultural Industries (NOCI), and the state and its leftist politics were prominently on display: one entire wall of the hangar was lined with the stands of different government ministries, while talks typically circled around themes such as social inclusion, denunciations of the market and democratisation of cultural access. Nevertheless, MICA was a trade fair and the presence of many small- and medium-sized cultural enterprises eager to do business, alongside the Ministry of Culture's pronouncements about the value of culture to the Argentine economy, also gave the event something of a New Labour-esque flavour.

In particular, MICA provided a graphic illustration of the disputed territory of culture and intellectual property in Argentina. SADAIC, CAPIF and AADI had sponsored a Café de

la Música, hosting a series of talks defending their traditionalist vision of music and IP. A few yards away, the 'hackathon', a project devoted to developing free music hardware and software, was taking place. These ideologically conflicting programmes rubbed shoulders—almost literally—for four days. Elsewhere in the building, public talks included a debate on digital culture by a distinguished panel that articulated a critical vision of the current IP regime defended by SADAIC, CAPIF and AADI. The senator Liliana Felder launched the debate by contrasting two metaphorical locations for culture—the market and the plaza—and remarked, 'I think that everyone sat here wants culture in the plaza', revealing not only her own backing for the idea of a cultural commons but also her perception that this view was widely shared across MICA. With presentations elsewhere by Taringa! Música and prominent IP critic Beatriz Busaniche, attendees were offered a full range of views under the same roof.

Rodolfo Hamawi, the director of NOCI, organised a public meeting at MICA between Taringa! and its principal adversaries (SADAIC, CAPIF, AADI and the Argentinean Book Chamber), who met to sign a letter of intent ('Taringa' 2013). This event revealed a progressive branch of the state attempting to broker a compromise between a forward-looking digitally focused enterprise and backward-looking analogue-era institutions. The outcome was inconclusive, however, with two institutions failing to send senior representatives and public pronouncements still revealing discords.

Other institutional tensions were symbolised by the very location of the fair. Tecnópolis, a national government project, was originally planned to be built in the City of Buenos Aires but, facing stiff resistance from the city's right-wing mayor, Mauricio Macri, it was eventually constructed just outside the city limits. The federal and municipal governments were in the hands of opposing political parties, ensuring a low level of coordination between their public policies. National cultural programmes stemmed from the Ministry of Culture, whereas the municipal music office, Opción Música, was based in the Ministry of Economic Development; their respective ventures thus tended to have different ideological slants, specifically with regard to the balancing of social and economic objectives, and at times even came into competition. Opción Música, which pursued a neoliberal 'creative economy' line, attempted to reinvigorate the local music industry by introducing new models from the global North, but it faced resistance from the collecting and trade societies, disinterest from the major labels and tensions with leftist federal government institutions like NOCI. Opción Música's absence from MICA was telling.

MICA thus displayed a complex picture. There were ample signs of the conservative positions, institutional tensions and resulting stasis analysed earlier in the chapter, yet also a sense that new, more progressive cultural ideologies and policies were coalescing, ones attuned to the fair's surroundings, Tecnópolis, which exemplified a post-neoliberal national technological imaginary, revolving around the state and its concern with social inclusion. In the guise of NOCI, the state positioned itself at the centre in several ways: it hosted the event; it occupied the middle ground between Taringa! and the 'analogue' institutions, between copyleft and copyright, expressing both sympathy and criticism for both sides; and, more broadly, it argued that its involvement was crucial to the healthy development of the cultural industries. The state's role in the field of digitisation and culture thus merits further analysis.

State digital initiatives

If early digital culture initiatives came primarily from the commercial sector, the state increasingly sought to drive developments in the field. From 2003 the governments of Néstor and Cristina Fernández de Kirchner defined themselves in opposition to the previous neoliberal regime and prioritised social objectives. Recognising the potential of new technologies to advance its overarching social and political goals, the government became a leading actor in the field of digitisation. Flagship schemes such as Argentina Conectada (a national fibre optic cable network), Open Digital Television, the one-laptop-per-child programme Conectar Igualdad and Tecnópolis were all framed in terms of promoting national autonomy, sovereignty and identity. They were presented as motors of social and cultural inclusion more than economic development.

The Minister of Culture, Jorge Coscia, described new technologies as possessing 'enormous educative potential' and 'at the service of the democratisation of culture' (Coscia 2012, 17). For Hamawi, 'technology is placed at the service of inclusion and diversity' and flagship digital programmes were aimed primarily at reducing social and cultural divides (*Hamawi 2012, 8)*. Such discourses were underpinned by a vision of new technologies as tending to promote concentration of wealth and opportunities if left to the market. In the hands of the state, however, they might constitute technologies of social inclusion, widening participation and national unification. Above all, the digital was understood as political. *Página 12* journalist Washington Uranga argued that 'full citizenship is not possible today without thinking about the communicational and, within it, the digital', and hence 'the digital and the communicational is a space of political struggle'.[23]

There were, therefore, close connections between the state's digital strategy, political agenda, social mission and cultural vision. Widening access to both culture and new technologies was a central goal, because they formed two pillars of national sovereignty. Infrastructural programmes were intended to allow the state to distribute more widely cultural products that might fortify national integration and identity.

Increasingly, then, the digital and the cultural went hand in hand. Argentina Conectada was designed to foster not just better communications but also the creation of 'socially valuable' cultural content. Puntos de Cultura, inspired by the Brazilian programme of the same name, funded over four hundred 'culture points', which were provided with a computer (loaded with the government-designed free operating system Huayra) and digital video cameras. Igualdad Cultural (Cultural Equality), whose tag line was 'inclusion in diversity', brought together the Ministry of Culture and the Ministry of Federal Planning, Public Investment and Services—exemplifying how culture and the digital were bound together in the national political project. Igualdad Cultural 'conceives of access to Information and Communication Technology (ICT) and culture as a fundamental right of all the inhabitants of Argentina. This initiative aims, therefore, to foster the conditions to bring about equality of opportunity across the country with regard to the creation and enjoyment of cultural goods, and access to new forms of communication.'[24] Its goal was to use new technologies to open up cultural production, distribution and consumption to every corner of Argentina, for example by

[23] http://lic.cultura.gob.ar/foros-de-cultura-digital. No longer available.

[24] http://www.igualdadcultural.gob.ar. No longer available.

broadcasting live performances via Open Digital Television and a Federal Network of Digital Culture. One planned subproject entailed the creation of an Online Music Bank, a tool for disseminating music but also facilitating the fulfilment of the quota for national music on the radio stipulated by the 2009 media law.

Another Ministry of Culture digital initiative, Plataforma Argentina de Música (PAM), was launched at MICA in 2013. PAM was an online music platform aimed at promoting the Argentinean music industry to distributors, labels and festivals around the world. It focused not on selling digital content but rather operating as a digital catalogue for the national music industry. PAM was planned as a complement to the Online Music Bank, with the former aimed at the music industry and the latter at the media and consumers. It was a commercial initiative, but like most Ministry of Culture policies, it articulated a balance between economic and social objectives and had a marked nationalist slant. Hamawi described the project as intended to promote equality and 'to put together a broader, more democratic and inclusive map of Argentinean culture'.[25] Its vision was ambitious: to offer a public-sector alternative to YouTube and iTunes, with the bonus of fostering interaction between different industry actors.

The government's policies that linked digitisation, social inclusion and cultural access and production were noteworthy, but it should be underlined that most such projects were still progressive dreams more than concrete realities at the time of my fieldwork, and few made the transition. The Online Music Bank stalled because of a clash between widening cultural access and authors' rights. There were considerable problems around the licensing of digital content produced and circulated by the state. The government's digital TV initiative included a music branch, ACUA Música, but it appeared largely inactive. The digital TV project aimed to increase the diversity of cultural offerings, but it suffered from poor coordination between different bodies and lacked a clear sense of how content creation was going to be funded over the long term (Mastrini et al. 2013). PAM appears never to have fully taken off. It cannot be argued, then, that these music and digitisation projects had significant effects. Nevertheless, they have much to tell us about digital ideologies and desires within the orbit of the state at a particular historical juncture, one that was soon to be firmly relegated to the past.

The state's increasing activity in the cultural realm bore some fruit for independent musicians, though above all in the realm of live performance. Igualdad Cultural sent artists to perform well-paid concerts around the country, again in the name of social and cultural inclusion; Miss Bolivia, a close collaborator with ZZK, was one beneficiary. In 2013 the programme had around $1 million to distribute to 200 groups to provide ten concerts each. Another Ministry of Culture programme, Recalculando, was working with around twenty musical collectives around the country, focusing on boosting live music scenes and touring opportunities (see below). Tecnópolis provided well-paid performing opportunities for a number of DJs and bands from the middle-class *cumbia* scene.

In contrast, digital initiatives appeared poorly coordinated, sometimes even in contradiction and somewhat invisible in practice. Nevertheless, they might be understood as attempts by progressive (and often younger) voices within the state to promote change in a sector dominated by more conservative (and often older) institutions and individuals. Cultural officials and experts believed that progress would be slow and laborious in the face of the

[25] http://www.mica.gob.ar/1843/la-secretaria-de-cultura-de-la-nacion-lanzo-la-plataforma-argentina-de-musica-pam/. No longer available.

indifference or contrary interests of a static local private sector and multinational enterprises with considerably larger budgets. Furthermore, they considered both the announcement of ambitious public policies and their patchy implementation to be characteristically Argentinean. It would be a mistake, then, to regard limited progress as simply a sign of insignificance.

In this regard it is worth noting that some of the most dynamic figures in the sphere of music and digitisation moved towards increasing involvement with the state at this time. Fer Isella, who made his name as a music entrepreneur, directed the music section of MICA 2013 and led the launch of PAM, while Tatu Estela gave up his job as director of Taringa! Música in mid-2014 to take up the post of Coordinator of New Technologies at the Ministry of Culture. Such moves would support an argument—one explicitly articulated by Estela—that the public sector was more appealing than the private in Argentina at the time with regard to the intersection of music and new technologies. In neoliberal contexts in the global North, it is usually the state that is cast in the role of the slow-moving or heavy-handed player while the private sector is presumed to be fleet of foot; but in Argentina, with the private sector dominated by 'analogue' institutions, progressive initiatives in this period were concentrated within the state.

'Where are the cultural industries heading?'

Placing Argentina's independent music sector in political context generates a more nuanced understanding of the stasis presented earlier. The Kirchner governments came to see the significance of digital technology as lying primarily in the social and cultural realms; public policies relating to digitisation and culture thus increasingly prioritised social inclusion and cultural participation over economic development. The music industry panorama at this time may then be seen as underpinned by post-neoliberal politics and, in particular, by critical attitudes to digital capitalism.

NOCI's list of objectives began with 'democratising access to and the production of cultural goods and services, [and] promoting geographical and economic decentralisation'.[26] Its stance may be summed up by the phrase 'digital social justice' (Loreti and Lozano 2012), found in a book that it published in 2012, *En la ruta digital*. With a prologue by NOCI's director, Rodolfo Hamawi, and the opening chapter by the culture minister, Jorge Coscia, this book represented an important strand of the government's thinking on culture and digitisation at the time. Hamawi (2012) argued for the internet as a tool of public service rather than private enterprise, while Coscia wrote of 'designing an egalitarian and redistributive digital policy' (2012, 14). The market was portrayed as exclusionary and restrictive, and authors promoted the state as guarantor of social inclusion, democratisation of culture and access to knowledge.

Natalia Calcagno, a Ministry of Culture researcher, described the genesis of NOCI's recent line, and in particular its choice of the label 'cultural industries' rather than the more contemporary 'creative industries', in terms of a deliberate rejection of the latter's neoliberal orientation (treating culture primarily as an engine of economic growth). There are notable echoes of Brazil's public policies on digital culture, summarised by Horst (2011, 451) as committed to 'digital inclusion and resistance to the broader normative order of global capitalism'. While undoubtedly influenced by such post-neoliberal policy directions in the region,

[26] http://www.cultura.gob.ar/areas/industrias-culturales/. No longer available.

NOCI's vision was characterised primarily by a rejection of specific neoliberal examples, such as the UK's approach and its exportation to countries like Colombia. The stasis described earlier in the chapter may thus be seen as underpinned not just by institutional resistance and tensions but also by the scepticism of state cultural policymakers towards free-market conceptions of progress.

Within the Ministry of Culture, progressive voices attempted to formulate a vision of post-neoliberal cultural industries. The ministry's discourse on this topic exhibited the key transformative features of Latin American post-neoliberalism, identified by Macdonald and Ruckert *(2009, 7)* as a new agenda of social inclusion and, more specifically, 'governments' willingness to use state power to stimulate the economy and correct widespread market failures; to substantially deepen democracy by engaging citizens more directly; to use state institutions to reduce social inequalities through redistributive measures; and to renationalize some parts of the economy'. *En la ruta digital* may be seen as launching a debate on the shape of Argentina's cultural industries for the post-neoliberal as well as the digital era, and indeed positing digital technology as a powerful mediator of a post-neoliberal agenda.

'Where are the cultural industries heading?' asked a debate on the book at MICA 2013. Recent achievements were held up against strong critiques of the previous neoliberal regime. Calcagno, one of the book's architects, critiqued policy responses to digital challenges in the global North as restrictive and authoritarian and articulated scepticism towards beliefs in the balancing effect of the market. Martín Becerra, a politically influential media scholar, identified two policy phases since 2003: the first saw a bolstering of the traditional media and cultural industries in the wake of the 2001 crisis; the second, beginning around 2008, saw a deeper, more politicised questioning of the whole model (see also Becerra 2013). This second phase, in which the state was more active, saw the first articulations of a post-neoliberal reconfiguration of the cultural industries, a shift that might be summarised as moves to democratise access, balance the economic and the social and redistribute profits from corporations to creators. Certainly, statements of intent were more apparent than actual reconfigurations. For example, NOCI proposed that cultural creators be rewarded from an authors' fund, financed by a tax on the profits of ISPs and telecoms, to counteract the concentration of profits in the hands of large corporations (Hamawi 2012; Calcagno and D'Alessio 2012), but no such fund was actually created. Nevertheless, more concrete examples can be seen in state initiatives such as Igualdad Cultural, the 2009 media law (with its quota for Argentinean independent music on the radio) and the 2012 National Music Law, aimed primarily at stimulating the independent music sector. [27]

En la ruta digital revealed clearly the connection between digitisation, culture and politics, and represented a statement of intent by progressive figures within the orbit of the Ministry of Culture. Recognising the futility of a direct approach to politicians, they opted instead to promote public debate around these issues within more amenable spheres, such as universities and the creative sector, with the aim of building up a critical mass of opinion that would then oblige politicians to take notice. Becerra noted that the 2009 media law—a major legislative achievement of the second Kirchner government—grew from debates among a handful of progressive individuals in the 1980s and 90s. There was thus an important precedent for this

[27] http://www.musicosconvocados.com/marco.html. Accessed 9 January 2022.

approach and evidence that it could lead to substantial change over the long term. Becerra argued that debates in forums like MICA and *En la ruta digital* served to put key issues on the public agenda. Concrete results might be thin on the ground at first, he said, and issues might even fade from view for periods of time (something that did indeed come to pass); but opening such debates was an important first step, laying the groundwork for the implementation of new ideas in the future.

Collectivism

A commonplace local reading of Buenos Aires' music industry was that it was 'behind', as evidenced by the late arrival of services such as iTunes and streaming—the implication being that it differed from that of the global North in terms of its position on a developmental curve rather than following a different trajectory. A clue to a different reading, however, was provided to me by Nicolás Falcoff, MICA panellist and director of the independent label Sura.

> We're realizing that we're not going to get anywhere on our own, that the whole is greater than the sum of its parts, that the way to work is to work collectively, that's what's coming now. I believe in work networks, in collective work, in solidarity economics, in networks of fair trade, in another way of making culture and another way of doing business … I'd tell anyone who wanted to do business to devote himself to something else, there are tons of businesses that are much more profitable than this one. The purging that took place as a result of this crisis meant that the pirates and the mercenaries really knew that there wasn't much for them here. Those of us who remain, the survivors, are organizing ourselves to see how, from an equitable starting point as far as possible, we may be able to create something a bit stronger and carry on doing what we like—which is music.

In Falcoff's vision, Buenos Aires' independent music scene, rather than presenting an inferior, belated copy of industry developments in the global North, displayed a search for alternatives to digital capitalism. His position was inspired more by social movements than capitalist entrepreneurialism, by a search for sustainability more than profit and growth. He described entrepreneurship among independent musicians in collective rather than individual terms, as 'the artist who is being empowered and saying "I want to do this, so I get together with another artist and another and we create a collective of artists to establish a work unit to put on [concert] series"; I see a lot of collective management and partnership among artists.'

State initiatives, too, were focused less on individualist entrepreneurialism than on collaboration. 'Collectives are the central actors of this new culture', stated Recalculando's promotional video.[28] This Ministry of Culture programme was working with twenty groups in mid-2013 and called them collectives, even though they were formed around record labels, because making records was only part of their activity. The term 'collective' thus signalled a shift in the nature of a record label, now conceived of as an association of artists from diverse fields engaged in a wide range of activities, with a different way of working—horizontal, collaborative, networked—and sustainability as its overriding aim. Recalculando promoted collective structures, arguing for strength in unity and a network as more than the sum of its parts. Its position was that such structures fostered a solidarity economy and eased the financial challenges that independent musicians faced under digital conditions.

[28] http://www.youtube.com/watch?v=WyQG-UwgIVQ. Accessed 9 January 2022.

Collectivism and cooperative thinking have a long history in Argentina, appearing at various points in the twentieth century. They blossomed in the late 1990s as increasing numbers of workers were marginalised under neoliberal conditions (Sitrin 2012; Zibechi 2012). The 2001 crisis saw an exponential rise of collectivism across Argentinean society, not least in the arts world (Giunta 2009, 54–64). Institutional weakness and economic hardship led artists to form collectives with a common vocabulary (horizontalism, self-management) and common traits (networked, economically autonomous, politically active and operating by consensus).

Just as this broad wave of collectivism was largely a bottom-up phenomenon, post-neoliberal reimaginings of the cultural industries were not confined to cultural officials and academics but also emerged from the independent music sphere. Falcoff presented his initiative as separate from Recalculando, as a private rather than government-sponsored programme, illustrating how collectivism circulated among independent musicians quite autonomously from government pronouncements. Indeed, many younger officials in Ministry of Culture music programmes such as Recalculando had started out in the independent music sphere. The transfer of ideas was thus just as much from the musical grassroots to politics as vice versa.

Collectivism was also a feature of the middle-class *cumbia* scene, not just in ZZK Records but also in large cumbia orchestras like La Delio Valdez, Sonora Marta la Reina, Orkesta Popular San Bomba and Cumbia Club La Maribel, which emerged from 2009. With one to two dozen players, they were not conceived as economic ventures, but rather stressed sociability over financial gain. Luciano Choque Ramos abandoned an earlier digital cumbia project, Imperio Diablo, to form Todopoderoso Popular Marcial in 2010, and he praised the symbolic impact of 'twenty people doing something together, the same thing, in real time—and it's pretty exciting what happens. You always see smaller groups or soloists or DJs or something quite individual, so seeing something more collective mobilises people'.[29] Such orchestras stood symbolically against both the digital and individualistic entrepreneurialism.

The collectivist ethos in the independent music sector thus evidenced the confluence of state and civil society ideologies and of post-neoliberal politics and subjectivities. It represented a vision of resistance among low- and mid-level actors to the intensifying corporatisation and concentration of the music industry. The currency of collectivism both within cultural institutions and among cultural producers, and its roots in local experiences after the 2001 crisis, suggested that it was more than just a passing fad or opportunistic slogan. Though it was to come under pressure as a result of future political changes, collectivism constituted a noteworthy response to digital conditions in Argentina.

Argentina in regional context

An important inspiration for Recalculando (and its predecessor, the Network of Independent Collectives or RECI) was Brazil's Fora do Eixo ('Off the Axis'), a national network of collectives that began working in 2005 to increase performing opportunities for independent musicians. The result was a national circuit, outside the structures of the mainstream music industry, to facilitate touring and reach new audiences. According to the Brazilian cultural official Jéferson Assumção (2013), Fora do Eixo (or FdE) brought a third player into the equation, alongside the state and the market: the community or collective.

[29] Interview with Luciano Choque Ramos, May 2012.

Assumção's adaptation of the state/market/civil society triad illustrates the extent to which collectivism was shaping social, cultural and political imaginaries in post-neoliberal Latin America, and the same was true in the technological sphere. Regional conceptions of the internet revolved to a considerable degree around his third term. As Garrido (2012, 94–5) noted, the internet was rarely treated as a commercial space by young people in Buenos Aires; its social and cultural aspects were paramount and ideas of networking and sharing were much more prominent than monetising. Similarly, Horst (2011) identified three key themes in the new media landscape in Brazil: digital inclusion, free culture and networked sociality. The last of these was utilised by FdE to try to strengthen independent music production across Brazil, generating publicity and audiences for live music and fostering the circulation of bands (Garland 2012, 510). The emergent collectivism in Brazilian and Argentinean independent music scenes was thus underpinned by particular local understandings of the internet.

FdE and Recalculando had fervent advocates, such as Assumção and British independent music network UnConvention.[30] It should be underlined, however, that the Brazilian network also generated a growing wave of polemics from grassroots and academic sectors (e.g., Garland 2012; Miseravel 2013). Nevertheless, such programmes were calibrated to the challenges and opportunities facing the independent music sphere in countries where the internet was conceived as functioning more effectively in fostering social networks than in selling digital content or services, and where governments placed more emphasis on digital inclusion than e-commerce.

A number of initiatives discussed in this chapter, like Recalculando, illustrate the growing links between the leftist state and the independent music sector, which had been left largely to the market during the neoliberal 1990s. The 2009 media law included a quota for Argentinean independent music on the radio, while the 2012 National Music Law gave concrete form to the sense that the independent music sector lacked economic viability and required state support, particularly in the wake of the Cromañón tragedy. NOCI's proposed authors' fund provided a further example of the state's recognition of the tendency towards the impoverishment of cultural producers in conditions of digital capitalism and its desire to intervene to alter this situation.

One might therefore identify several distinctive features of the independent music sector in Argentina and Brazil, the two largest Latin American countries to take a post-neoliberal turn in the early 2000s. One was collaboration between the state and the independent sector, based on a questioning of digital capitalism and its effects on smaller players. Both sides agreed that state intervention provided a necessary rebalancing of a rapidly concentrating field. Digitisation was seen as both a threat and an opportunity, with the market posing the former and the state guaranteeing the latter, and—in this vision—the opportunity was social and cultural more than economic. A second feature was collectivism. If the spread of digital technology fostered a 'do it yourself' independent ethos in the 1990s, the 2000s saw the rise of 'do it together'—also making extensive use of new technologies, but underpinned by a more collaborative ideology. A third was the particular characteristics of internet use, which focused on digital inclusion and networked sociality and thus supported the collectivist paradigm.

[30] https://www.unconventionhub.org/. Accessed 9 January 2022.

Viewing Argentina through the lens of Assumção's triad of state, collective and market, three conceptions of digital technology appeared to be at stake. For the state, digital technology was primarily a technology of social justice and cultural participation; for the collectivist paradigm, a technology of social aggregation and networking; and for the market, a technology of economic development and profit. These three conceptions were not mutually exclusive and many initiatives, both state and private, incorporated all three to different degrees; the issue was therefore one of emphasis. That said, *En la ruta digital* articulated a direct contest between the state and market visions of new technologies and it advanced a post-neoliberal line on the social potential of digitisation and its intimate connection to culture. In relation to the independent music sector, with commercial digital initiatives struggling, it was arguably in the first two realms that the most noteworthy developments were taking place in 2011–13, and the first two ideologies of the digital were in the ascendant. The state's digital initiatives and the collectivist movements, and their mutual interactions, showcased at events like MICA 2013, aspired to shape a post-neoliberal music industry, and their efforts, however abortive they turned out to be, constituted a distinctive contribution to global music industry debates.

Coda

The election of the centre-right candidate Mauricio Macri as president in late 2015, after twelve years of leftist governments, changed Argentina's political complexion overnight. It also provoked a wave of profound concern within the independent cultural sector. As mayor of Buenos Aires, Macri had been known to independent musicians mainly as the force behind the closure of many small venues and the imposer of restrictive legislation.

Two important shifts can be noted in the Macri period. One was the waging of a 'culture war' on the Kirchners' legacy.[31] This campaign focused not just on projects explicitly tied to the former presidents, such as the Kirchner Cultural Centre, but also on social and cultural programmes such as the school netbook initiative Conectar Igualdad.[32] The other shift was a return to neoliberal ideologies and more market-based policies, with effects immediately felt in the cultural field. For example, the progressive National Office of Cultural Industries (NOCI) was closed, to be replaced by a Department of Culture and Creativity, led by Enrique Avogadro, a former cultural official in Macri's right-wing city government. The department immediately abandoned NOCI's 'cultural industries' focus in favour of a 'creative economy' line, initiating a Network of Creative Cities.[33] Whereas the collective had emerged in the Kirchner years as an important cultural player, 2016 saw the installation of the entrepreneur at the heart of the government's imaginary.[34] The collectivist music programme Recalculando was disbanded, its *gestores culturales* replaced by Argentina Creativa's *emprendedores culturales* (cultural entrepreneurs). The Online Music Bank, which had changed focus and moved towards digitising old tango and folklore records, was also shut down. The day after the election, its

director, Tatu Estela, was refused access to his office in the Kirchner Cultural Centre; most of his team were fired and other cultural programmes were removed from the building.[35]

It should be recalled, however, that even a year before the election, many of the enterprises and initiatives considered in this chapter were struggling either to get off the ground or to continue operating. The 'active state' had formulated ambitious, progressive plans for digitisation and culture, focusing on connectivity, visibility and redistribution of revenue, yet it was having little impact on musicians or the circulation of music. Its digital music initiatives made no dent in the dominance of Facebook and YouTube, far and away the most visited websites in Argentina ('Encuesta nacional' 2013). Taringa! Música and PAM, local initiatives from the private and public sector respectively, had failed to challenge the hegemony of behemoths from the global North. Taringa! Música was going to be the Latin American Spotify, until Spotify got there first. PAM, meanwhile, appeared defunct. Not all the stunted growth or demise of such developments can therefore be laid at the door of Macri's government.

If we consider such programmes in terms of their effects, they appear insignificant. If we consider them, however, in terms of the thinking behind them, they tell us much about efforts from both public and private sectors to construct alternatives to dominant models of digital capitalism. They may have disappeared under pressure from global forces, multinational corporations and changing national political priorities, yet their fragility and evanescence makes it all the more important to document and analyse them.

From the perspective of independent musicians to whom I spoke in 2016, the panorama appeared unpromising, even worrying. If leftist governments had been able to do little to stem the concentration of rewards in the hands of an established elite of major concert promoters and performers, many of them foreign, a right-wing government that actively supported this process looked unlikely to emerge as a saviour. Even without the political change—a depressing development for many alternative-minded musicians—conditions were hardly favourable for large swathes of the Argentine music industry.

In a frank magazine interview over a year before the election, Grant Dull declared that 'the industry is shit … full of bad vibes and sharks' (Erbar 2014). He acknowledged publicly that the label usually lost money or at best broke even; that every year he considered giving up; and, more poignantly, that 'money and the suffering of wanting to make a business among friends is always going to damage friendship'. By 2014 most of ZZK's artists retained only a tenuous link to the label. Some had signed with other labels or released albums independently, leaving ZZK with leftovers: a digital release, a percentage of a back catalogue, or a booking or management fee. There had been a proliferation of micro-deals as each artist negotiated each aspect of their activity separately. As one told me, they had come to the realisation that the label was not going to make a living for any of them, so each one was now trying to make their own way without completely abandoning the ZZK brand.

This downbeat picture found echoes in reports from elsewhere in Latin America, such as Mexico City (Woodside Woods et al. 2012), where the flourishing of creative innovation was accompanied by 'the extensive exclusion of the majority and the condemnation of creatives to intermittency and precarity' (García Canclini and Urteaga 2012, 203). In Santiago de Chile, the majors retrenched; independent labels were scarce and run on a shoestring; there were

[35] Such shifts in the institutional landscape are illustrated by the disappearance of a number of the webpages that I used in drafting this chapter.

few small to medium venues; independent artists suffered from lack of audiences; and profit was almost entirely concentrated in mega-concerts by international artists (Solís 2010). One frustrated musician labelled Santiago's independent scene as 'in intensive care' (Solís 196)—worse than 'in the waiting room'.

Nevertheless, there were also some grounds for more optimistic assessments. The Digital Music Reports for 2012 to 2014 reported strong growth across the region and predicted a bright future for the digital music business in Latin America. The 2017 IFPI Global Music Report announced that Latin America was the region with the highest level of growth in revenue from recorded music for the seventh consecutive year, with a 12 per cent rise. Digital revenue grew by 31.2 per cent and streaming revenue by 57 per cent.[36] The previous year, Argentina had seen an increase of 34.8 per cent in revenue from recorded music, thanks to a 140 per cent rise in digital revenues, and streaming was making increasing inroads, representing 86.6 per cent of the digital market.[37]

Within the scene that I studied, ZZK Records' fortunes were waxing again by 2017, on the back of several productive crowdfunding campaigns and the international success of Nicola Cruz, who signed to the label in 2015. Grant Dull launched a new venture in Ecuador *(AYA Records)* and focused increasingly on making documentaries outside of Argentina *(ZZK Films)*. Back in Buenos Aires, success stories could be found among post-digital projects such as traditionalist middle-class *cumbia* orchestras (such as La Delio Valdez) and neo-World Music bands (such as La Yegros), rather than more experimental digital projects. A more upbeat picture could also be seen in *música turra*, which showed similarities with Brazilian digital music scenes like tecnobrega, baile funk and electronic forró. These scenes, with their enthusiastic adoption of new technologies, legitimisation of informal copying and distribution, and emphasis on live performance, have been held up as innovative responses to the crisis in the recording industry and possible models for the future (see 'The Paraense Tecnobrega' n.d.; Howard-Spink 2006; Comin 2011; Krauskopf n.d.; Pereira de Sá and Oliveira Miranda 2012). Vianna (2011, 247) argued that such vibrant and inventive new music economies, which were emerging on the edges of large Brazilian cities, might point the way forward for the mainstream music industry.

Still, there was continued uncertainty over which of these futures lay ahead, suggesting the continued aptness of the metaphor of the waiting room—although it might also be argued that the independent sector's struggles had been going on for so long in Buenos Aires that they were actually the destination. However, this metaphor serves, above all, to capture the sense of uncertainty within the sector at a particular historical juncture. In 2012 the independent music industry sensed change coming, but was pulled in several directions at once. The city government's Opción Música regarded the local music industry as needing to be brought up to date with developments in the global North; it thus focused on translating new business models from the outside world to Argentina. The Ministry of Culture and NOCI looked to other sources of inspiration, such as the egalitarian, redistributive cultural policies of Brazil. To generalise, the city government sought to stimulate digital entrepreneurialism while the national government spoke of digital social justice. In both cases, Argentina was seen as behind, and policies were designed to pull it forwards, though in different directions,

illustrating divergent orientations to two rival spheres of influence on Argentina—the global North and Latin America—and to the neoliberal and post-neoliberal ideologies that coexisted and competed in Buenos Aires' cultural sector. Complicating the picture further were the old 'analogue' institutions—particularly the collecting and trade societies—which, with their eye on the past, tended to resist both of the competing new models. It was unsurprising, then, that the independent music sector felt like it was stuck in the waiting room.

CHAPTER 15

From Revolution to Reform: Recommendations for Spectrum Policy in Transitional Tunisia

Moez Chakchouk, Danielle Kehl, Jochai Ben-Avie, and Kate Coyer

Journal of Information Policy 3 (2013): 575–600. https://doi.org/10.5325/jinfopoli.3.2013.0575.

Abstract

Will the revolutionary changes of the "Arab Spring" result in more open and democratic media in the affected countries in the Middle East and North Africa? Using developments in Tunisia as a case study, the authors argue that democratically reformed media, Internet, and spectrum policies can lead to a more enabling and pluralistic environment that encourages new market entrants. Progress has been made, but ongoing challenges in structural and institutional reforms remain. The authors make a series of policy recommendations in the hope that Tunisia can be a model for its regional and global peers.

Introduction

In December 2010, Tunisian fruit vendor Mohamed Bouazizi set himself on fire to protest the pervasive corrupt practices of his municipal government. His actions sparked widespread demonstrations in Tunisia that were magnified by both traditional news outlets and social media. These protests, in turn, triggered a wave of social unrest around the Middle East

BY-NC-ND

in what would come to be called the Arab Spring. In January 2011, after 24 years in power, Tunisian President Zine el-Abidine Ben Ali became the first Arab leader to step down in response to the pressure against his rule. The following October, Tunisia held the first post-Arab Spring election, and the country is now in transition towards a more robust democracy through constitutional reform, a process that involves overhauling many of the policies and regulatory regimes over which Ben Ali once maintained a tight grip.

As a nation, Tunisia has long stood apart from others in the region, ranking first among North African countries in the 2010–2011 World Economic Forum Global Competitiveness index [1] and boasting a stronger economy, a better-educated population, and relatively low poverty levels compared to many of its neighbors. However, the Ben Ali government also kept a notoriously close watch over its citizens, maintaining tight control over the media environment and restricting freedom of expression. While Tunisia has long had uncharacteristically high levels of mobile and broadband penetration when compared to the rest of the Middle East and North Africa (a reflection, at least in part, on the strength of its economy and overall competitiveness), its citizens were not able to enjoy many of the corresponding benefits of ubiquitous communications or an open Internet. Up until the day he fled the country, Ben Ali exercised significant institutional and personal control over the Internet, broadcasting, and the telecommunications sector, resulting in pervasive censorship and an official regulatory structure that was largely superfluous, lacking both sophistication and clarity. Today, foreign investors and independent broadcasters continue to find it difficult to navigate the system successfully, and many of the old rules and processes have yet to be redressed. The interim government has recognized the need to increase access to traditional and web-based media and encourage freedom of expression, and thus made the reform of media and telecommunications structures a key piece of their platform. However, a truly enabling and pluralistic environment that encourages new market entrants has yet to emerge.

As Tunisia continues its transition to democracy, civil servants and other political actors are facing several competing priorities, of which regulatory reform to ensure the free flow of information and a more democratic media environment is just one. Free expression, access to information, and freedom of the media in Tunisia must be backed by regulatory institutions and policies that encourage and enable media pluralism, access for new players (private, public, and community) to enter the market, and independent regulatory systems and media outlets. Spectrum regulation, which determines the frequencies that are assigned to broadcasters and other wireless technologies, is critical to this process. Spectrum policy designed to enhance democracy can help Tunisia maintain its competitive edge through increased broadband Internet penetration, widespread sharing of information and exchange of ideas, technological innovation, and long-term economic growth. [2] Spectrum policy should therefore be a major priority in the restructuring of Tunisia's media environment, particularly because of its impact on wireless communications and Internet connectivity.

---

[1] Klaus Schwab, ed., "The Global Competitiveness Report 2010–2011," report, World Economic Forum (2011), accessed Dec. 13, 2013, http://www3.weforum.org/docs/WEF_GCR_Report_2011-12.pdf. Tunisia ranked 32nd overall on the index.

[2] Turgut Cankorel and Lara Aryani, "A Spectrum of Regulations: Mobile Telecom Regulation in the Middle East and North Africa," *Convergence* 5 (2009): 165–175.

The public commitment to overhauling government policies to enable a freer media environment creates a unique opportunity to explore different spectrum policies and leverage these regulatory reforms for democratic and developmental gains.[3] This process, especially if it adheres to principles of access and openness, could serve as an example for other countries in the region that are seeking to reform communications policies to similar ends.

This article will begin by discussing the media environment, broadcasting and telecommunications regulations, and spectrum allocation policies in Tunisia before the January 2011 revolution. After identifying areas of deficiency in the old system, the article will summarize the progress that has been made in the post-revolutionary period, and address ongoing challenges and potential opportunities. One of the key objectives will be to reform existing structures and institutions as a part of Tunisia's overall shift toward democracy and new attitudes toward media and access to communications.

Broadcasting and Telecommunications in Pre-Revolutionary Tunisia

Under former President Zine el-Abidine Ben Ali, the majority of institutions and key players in the Tunisian telecommunications and media sector were tied either directly or indirectly to the government, which had a hand in everything from the development of infrastructure to licensing and content regulation. Independent media groups, rather than enjoying autonomy and operating under a clear and transparent set of guidelines, were obliged to survive as best they could and find ways to coexist under the uncertainties of the Ben Ali regime.[4] As such, there was a disconnect in the Tunisian telecommunications and broadcasting landscape: Tunisia had some of the most robust infrastructure and highest rates of both mobile and Internet penetration in the Middle East/North Africa (MENA) region, but its government restricted individual freedom of expression and established a regulatory framework that gave the state enormous control—even in comparison to other MENA countries.

In terms of infrastructure development, Tunisia has long outpaced most of its neighbors, benefiting from a relatively stable economy, lower levels of poverty, and a citizenry more equipped to afford both the equipment and the associated operational costs of communications and broadcast networks.[5] As a result of this buildout, Tunisian citizens have near-universal access to mobile phone service and some of the lowest broadband prices in Africa. In 2008, Tunisia reported approximately nine million mobile subscribers out of a population of 10.2 million, and that number continued to rise until the number of mobile subscriptions surpassed the number of citizens about a year later.[6] Tunisia also reported 1.7 million Internet users

in 2008, and by March 2010, the number of Internet users had nearly doubled, reaching a reported 3.6 million. At roughly 33.9% of the population, the 2010 figure was significantly higher than the African average of 11.4% and well above the 31.7% mean for the Arabic Middle East at that time.[7] Yet despite these positive statistics, the regulatory framework in Tunisia remained stagnant in the pre-revolutionary period, which stifled independent broadcasting of radio and television. It also prevented regulators from responding to the demands created by the explosive growth of wired and wireless access.

Overview of Broadcasting and Telecommunications Regulation before the Revolution

Historically, the Ministry of Information and Communication Technologies has overseen the broadcasting and telecommunications industries at the cabinet level in Tunisia. The Ministry is broadly tasked with strategic planning to grow the domestic ICT sector and attract more international investment. The agencies under the Ministry's umbrella, including the National Broadcasting Corporation (Office National de la Télédiffusion, ONT), the National Telecommunications Commission (Instance Nationale des Télécommunications, INT), the National Frequencies Agency (Agence Nationale des Fréquences, ANF), the National Digital Certification Agency (Agence Nationale de Certification Electronique, ANCE), the Center of Telecom Studies and Research (Centre d'Etudes et de Recherche des Télécommunications, CERT), and the National Agency for Computer Security (Agence Nationale de la Sécurité Informatique, ANSI), have together been responsible for regulating broadcasting, telecommunications, and data and digital confidence. The role of Internet regulation fell originally to the Tunisian Internet Agency, a semi-private company with strong ties to the regime,

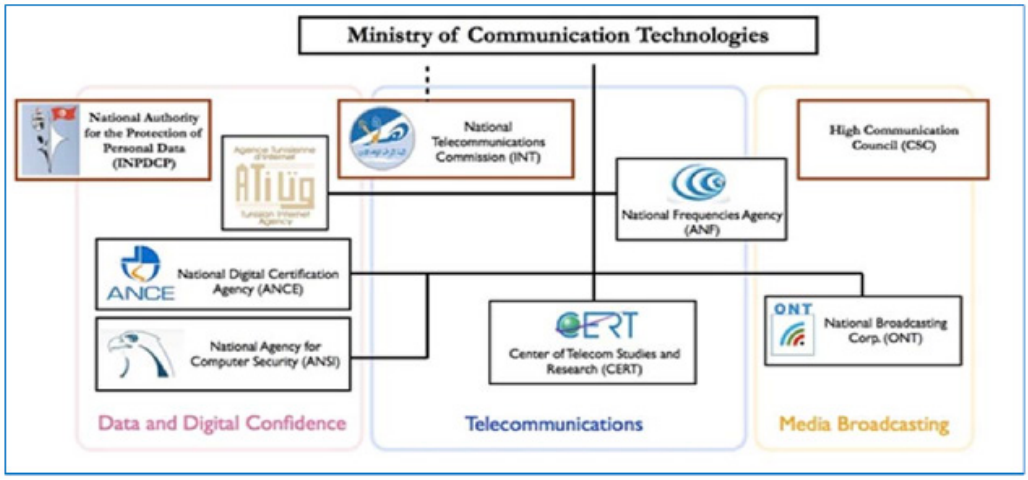

Figure 1: Regulatory agencies and authorities involved with the Ministry of Communication Technologies in regulation prior to the Tunisian revolution.

although later some of its authority was transferred to the National Telecommunications Commission. Figure 1 below illustrates the complexity of the regulatory system in Tunisia

[7] Data compiled from Internet World Stats, accessed Dec. 13, 2014, http://www.internetworldstats.com/stats1.htm#africa.

prior to the 2011 revolution, with nine different agencies and authorities overseen under the umbrella of the Ministry of Communication Technologies.

The public broadcasting landscape consisted of two television channels, Tunis 7 and Tunis 21 (now Wataniya 1 and Wataniya 2), and nine radio stations, four of which were national and five regional. The process for granting licenses to private media (including Hannibal-TV, Nessma-TV Mosaique-FM, Jawhra-FM, Shems-FM, and Express-FM) was largely opaque, which created a strong barrier to the development of the broadcasting sector. All licenses had to be authorized by the Minister of Information. Approval was further contingent upon a favorable advisory from an independent review board—the High Communications Council (Conseil Supérieur de la Communication, CSC), which was created by Decree No. 238 on January 30, 1989 and reorganized in 2008 by Law No. 2008-30 in preparation for a plan to liberalize the audiovisual sector. In reality, the review board was strongly tied to the regime and Ben Ali's advisers in the Presidential Palace, and most licenses were granted to government allies. Researchers at the Committee to Protect Journalists found that since the government started accepting applications in 2003, licenses had only been granted to friends and family of Ben Ali. For example, Cyrine Ben Ali, the President's daughter, owned Radio Shems FM, while Radio Zitouna for the Holy Koran belonged to Sakher El Matri, his son-in-law.[8]

Spectrum allocation was done through the National Frequencies Agency. The ANF allocated broadcasting bands to the ONT, the only entity with the right to own broadcasting transmitters. The ONT then distributed frequency bands to authorized radio and TV channels. As a result, private broadcasters in Tunisia had to first receive authorization from the government and then sign an agreement with the ONT to obtain a license to operate on a specific frequency.

The dynamics were similar in the telecommunications sector, where there was a largely state-controlled infrastructure and a vague regulatory framework. The largest provider of wired and mobile services in the country is Tunisie Telecom, which was established by the state in 1995. Although the government opened the mobile market to more competition in 2002, it did little to encourage real competition or create a climate conducive to foreign investment.[9] Consequently, although the government promoted access to mobile telephone and Internet services for its citizens, the regulatory framework did not reflect these policies.

There is perhaps no better example of the lack of structural institutions in pre-revolutionary Tunisia than the regulation of the Internet, which was made available throughout the country via terrestrial, satellite, and mobile data service providers but ultimately controlled by a single entity. In 1996, the government created the Tunisian Internet Agency *(the Agence Tunisienne d'Internet, ATI)* to serve as the central Internet authority, regulating the country's IP addressing and DNS services and operating the unique node for IP interconnection to the global Internet. When it reassigned all web services from the Institut Régional des Sciences Informatiques et des Télécommunications *(IRSIT, the research institute that was responsible for developing the Internet in Tunisia and connecting it to the wider world)* to the ATI, the government gave the ATI an unprecedented amount of responsibility and control over the network.

Consumer services were contracted out to Planet Tunisie ISP, the country's first commercial ISP, which was also owned by Cyrine Ben Ali. The government authorized additional ISPs in 1997 and the early 2000s, but they had to lease fixed-line access from Tunisie Telecom and international bandwidth from the ATI rather than controlling their own infrastructure and international connectivity. [10]

Under the Tunisia Telecommunications Code of 2001, the government established the National Telecommunications Commission (Instance Nationale des Telecommunications, INT) to serve as the lead regulatory agency in the telecommunications sector. Under the 2008 revisions of the Telecommunications Code, the INT was given an even broader mandate, ostensibly becoming an independent regulator of the telecommunications market with complete financial autonomy. The regulation of Internet services, which had previously been overseen by the Ministry of Information and Communications Technologies via the ATI, was also brought under the INT's purview in the restructuring. As a result, the INT took control of domain name regulation in 2009 while the ATI retained the technical role as registrar. In practice, of course, the Ministry of ICT had a heavy influence on INT decisions before the revolution, so the transfer of responsibilities from the ATI to the INT did little to actually alter the oversight process.

While the Internet regulation put in place in March 1997 (when only a few thousand Tunisians had connections) remained largely unchanged in the 14 years that followed, the ATI's censorship regime evolved a great deal, growing in both intensity and sophistication in response to network usage and expansion. As more Tunisians came online, the ATI spent an increasing amount of time and resources engaging in censorship on a massive scale. The Agency's policies were designed to shroud the work of the government, minimizing transparency and giving Ben Ali the ability to use the media for self-promotion and propaganda while silencing his critics. In the decade leading up the revolution, the ATI built both the technical infrastructure and the human resources capacity to implement keyword filtering, DNS and URL blocking, distributed denial of service (DDoS) attacks on sites that criticized the political regime, profile and mail hacking of its citizens, and more. [11] In addition to filtering and monitoring, the government arrested cyber dissidents who made both online and offline statements denouncing Internet censorship, even detaining and torturing a number of web activists during the 2005 World Summit on the Information Society, which was hosted by Tunisia. [12]

Consequently, Tunisia—often portrayed as more modern and liberal than many of its neighbors in the MENA region—began to draw international attention due to its systematic censorship regime. In 2009, the Committee to Protect Journalists ranked Tunisia seventh

on its list of the "Ten Worst Countries To Be a Blogger," placing it in the same league as nations like Burma, Iran, Syria, Cuba, Saudi Arabia, and Turkmenistan.[13] The following year, Tunisia made it onto the Reporters Without Borders "Enemies of the Internet" list, for having "wagered on a[n] infrastructure development strategy while keeping a tight control over the Web's political and social content."[14]

Changes in the Air: Satellite Broadcasting, Pirate Radio, and Cyber-Dissent

The rise of satellite TV from the late 1990s onward began to shift the broadcasting landscape to a limited degree, as it enabled content producers to exploit the relative lack of regulation compared to traditional broadcasting media and take advantage of the technical challenges of blocking it. Satellite infrastructure would prove particularly problematic for the Ben Ali regime during the Tunisian revolution, when both Al Jazeera and France24 managed to circumvent state control and disseminate unrestricted information about the protests via satellite, a technology that the Tunisian government did not have the technical capacity to censor or block to the same degree as others.[15]

The technological flexibility brought about by the rise of the Internet created other additional avenues for free expression. In 2007, six radio stations, whose owners were waiting for government approval for broadcasting licenses, formed Tunisia's first Internet radio station, Radio 6. The goal of Radio 6 was to support freedom of expression and encourage access to the airwaves. "We waited a long time for licenses from the Tunisian authorities to broadcast our programming. Eventually we met and decided to unify our efforts to launch a radio station on the Internet, through which we support the freedom of expression," said Saleh Forti, then-Secretary General of the Tunisian Union of Free Radio Stations.[16] The station owners took advantage of the vague nature of Internet broadcasting regulation, which was minimal compared to the hurdles they faced in their unsuccessful attempts to obtain traditional broadcasting licenses and frequency allocations.[17]

In addition to these more subtle forms of resistance to the Ben Ali regime's control over information networks in Tunisia, direct cyber-dissent became increasingly popular—even in the face of the government's extensive and sophisticated censorship machinery and overt intimidation techniques. In the months leading up to the revolution, several key events revealed the growing cracks in the regime's authority and its increasingly frantic attempts to

[17] It is important to note that these web radio stations were hosted outside of Tunisia, because the independent Tunisian ISPs were afraid that their content might anger the Ben Ali government and did not want to be held liable for any offending content.

exert control, including the December 2010 release of a damaging collection of documents by Nawaat, a blogging platform for Tunisian dissidents, in partnership with WikiLeaks.[18] When protests against the regime in Sidi Bouzid and other cities began several days later, Ben Ali immediately ordered the ATI to maximize censorship across the country, blocking a number of sites wholesale and severely limiting access to others, including YouTube, Dailymotion, and various social networks that Tunisians had been using to share information about the demonstrations.[19] Government operators were also engaged in phishing, spoofing, and outright hacking techniques to infiltrate communications networks, obtain login credentials to social networks, and block some users' access. Independent ISPs began to throttle consumer bandwidth and cap large file transfers, possibly in an attempt to make it more difficult for users to share news and images of the protests within Tunisia and with the outside world. Users reported mobile data service outages in some of the protest locations, although it remains unclear whether these were deliberate or simply network load failures.[20]

Tension between the government and its critics reached new heights during the first week of January 2011, as groups like Anonymous, a loosely-defined coalition of web activists and hackers, announced their support for the fight against censorship.[21] On January 7, Tunisian authorities responded by arresting a great number of cyber-dissidents in the country, targeting three key groups: activists, journalists, and bloggers.[22] Ultimately, however, the government's attempt to silence its critics only further inflamed the uprising in the streets, with violent clashes erupting between protesters and police between January 8 and January 12. In a last ditch effort to win back the favor of the citizenry, Ben Ali made a televised address on January 13, announcing a number of concessions, including his plans to institute widespread reforms, remove restrictions on the Internet and free speech, and release all those who had been detained. He also revealed that he did not plan to seek reelection in 2014.[23] Within a few hours, the changes began to take effect—although the eleventh-hour overture would ultimately not be enough to save Ben Ali's presidency.

Progress in the Post-Revolutionary Period

President Zine el-Abidine Ben Ali's departure from Tunisia on January 14, 2011 was a pivotal moment in the country's history. His resignation opened the door for Tunisia to hold its first real democratic elections. This landmark event led to a call for a general overhaul of media policies in Tunisia, including the creation of a robust legal framework for regulating the media and for issuing licenses for new types of media.[24] Although these regulatory agencies technically existed under the previous regime, the opaque and often informal nature of those relationships had rendered the system complex and largely ineffective, particularly in supporting the government's newly prioritized democratic goals of open access and fostering a free media environment. Just as political repression in Tunisia had been linked to strict control over telecommunications and broadcasting, promoting political freedom now requires the development of a transparent regulatory system that can adequately address these challenges.

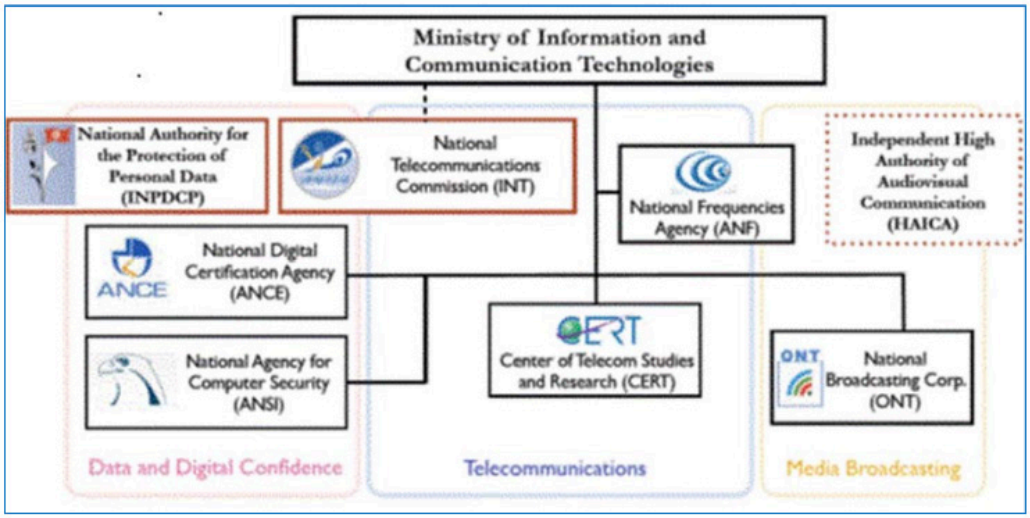

Figure 2: Regulatory agencies and authorities involved in regulation with the Ministry of Information and Communication Technologies after the Tunisian revolution.

The Ministry of Information and Communication Technologies continues to oversee most of the regulation in post-revolutionary Tunisia, although many of the pernicious practices associated with the Ministry of Information have been dismantled. The ATI, once a symbol of Ben Ali's authoritarian rule in Tunisia, has undergone dramatic changes in the name of openness and transparency, including revealing details about the censorship and surveillance it carried out during the previous regime and shifting its role towards the technical operation of Tunisia's infrastructure as an Internet Exchange Point (IXP).[25] The Agency, which previously authorized ISPs with the approval of the MoICT, no longer has any regulatory role and no authority or formal involvement in the system under the MoICT and the INT.

Figure 2 above lays out the restructured regulatory system developed after the revolution, highlighting the shifts after 2011, including the removal of the ATI from the structure and the establishment of an independent authority that will be discussed in more detail below.

The latter, Decree Law No. 2011-116, outlines the creation of an Independent High Authority of Audiovisual Communication (HAICA), which will be responsible for broadcast licensing, content regulation, and public accountability.[26] Article 16 discusses the specific competencies of the agency, declaring that broadcast licensing will be regulated by HAICA in coordination with the authority on spectrum management. However, while the Decree defines the composition of the regulatory body, its powers, and its possible budgeting scheme, it is not "a substantive norm that regulates material aspects related to the provision of audiovisual media services, such as licensing, content, public service broadcasting, and so on…"[27] In essence, the Decree outlines the broad scope and structure of the agency but no specific processes. Thus, while it is an important first step—and still places Tunisia ahead of most MENA countries in liberalizing its spectrum and media regulations—it lacks the specificity to actually operationalize these new responsibilities. In particular, while it suggests possible funding, the Decree does not concretely define revenue streams, and while HAICA will likely play a role in supervising a Tunisian public broadcaster if it is established, the law itself does not include specific provisions about public service audiovisual media.[28] This lack of specificity continues to inhibit the development of a more robust and accessible licensing regulatory infrastructure, which in turn limits the flourishing of a free media environment.[29]

On April 30, 2012, INRIC released a comprehensive report that details the Committee's recommendations to the government and other major stakeholders in Tunisian public and private broadcasting and Internet services. The goal of the report was to help ensure that the Tunisian people have the right to objective, free, and pluralistic information through legislative reform. In its overview of the existing media environment in Tunisia, the report identifies significant challenges stemming from the fact that before the revolution, "Laws were either nonexistent, as in the case of the audiovisual sector, or draconian, like the press code of 1975."[30] Ultimately, the Committee argues that among necessary legislative reforms, Tunisia must establish independent regulatory bodies in the areas of broadcast, print, and electronic media "to try to bring some order and to address the highly complex problems that are posed."[31]

A number of INRIC's specific recommendations bear directly on spectrum management, broadcasting, and freedom of expression. First and foremost, the report urges the inclusion of "the principle of freedom of expression, press, information, and digital communication"

[31] Ibid., 19.

in Tunisia's new constitution.[32] The Committee also recommends giving constitutional status to HAICA, thereby ensuring the institution's permanence and authority, and enshrining principles against filtering of websites and electronic journals or blogs "for any reason whatsoever."[33] On the public broadcasting side, the report outlines the creation of management and governance mechanisms for public radio and television organizations. With regard to private broadcasting, it emphasizes the need to preclude the state broadcasting agency, the ONT, from "all forms of political and economic interference." INRIC also calls for an independent body to analyze the national radio frequency spectrum on the FM band to determine which frequencies are available at the local, regional, and national levels. In order to give more autonomy to the regional media, the report calls for an assessment of the characteristics and needs of each region and its respective audience, and urges the reduction of broadcasting fees for new regional radio stations.[34] Finally, on the issue of the role of the ATI and the oversight of Internet services in Tunisia, the Committee notes the need to "define the relationship between the various stakeholders," including telecom operators and ISPs, and to review the tasks of the ATI (as an Internet Exchange Point) and other bodies that monitor and regulate the Internet.[35]

Ongoing Challenges in Tunisia

Instead of completely eliminating and replacing the legal institutions and structures that existed under the previous regime, government leaders and independent stakeholders in Tunisia have sought to modify and reshape these organizations to better adhere to democratic principles and values demanded by the populace. There is merit to the strategy of reforming existing structures instead of creating new ones, but it is also challenging, as it requires patient, diligent work to shift the systems, interests, and public perceptions that have existed for years. Many of these institutions continue to operate under the same people, rules, and regulations as under the previous regime. As Mir writes, "In institutional terms… Tunisia still does not have an administrative and judiciary structure ready to apply democratic laws and to perform according to non-authoritarian principles. The core of the executive power and public administration remains roughly the same."[36] The continuing political instability in Tunisia has only amplified this problem and poses a challenge to comprehensive regulatory reform.[37]

The INRIC report spells out a number of positive recommendations. However, INRIC's role as an outside entity, established after the revolution, proved to be both a strength and a weakness; while the Committee's independence gave it significant influence and power to confer legitimacy on the Tunisian reform process, it also provided it with little room to actively make the changes it recommended. In July 2012, after the completion of its review,

[32] Ibid., 21.

[35] Ibid., 26.

[36] Mir, "The New Tunisian Legislative Framework: A Focus on Press and Audiovisual Media," 14.

[37] "Tunisia Head-to-Head: What Next?" BBC News, Aug. 27, 2013, accessed Dec. 14, 2013, http://www.bbc.co.uk/news/world-africa-23790897.

Laabidi announced that INRIC would shut down, expressing some doubts about the future of the media environment in Tunisia.[38] The report itself echoes similar concerns that the government may not actually implement many of these reforms, particularly as it has not yet taken concrete steps to establish and fund HAICA, even though the law was passed in November 2011.[39] In that vein, while the state broadcaster is slowly adapting to the new, post-revolutionary culture in Tunisia (despite having previously served as a virtual propaganda arm of the government), it has not yet established itself as acting reliably in the public interest.[40]

Significant barriers to private entry into the broadcasting sector remain as well. The ONT retains exclusive rights to own broadcasting transmitters, and rents them to private broadcasters for an additional fee beyond the license for spectrum assignment by the ANF. In total, these agreements incur fees of about $60,000 USD (110,000 TND) for most of the new radio stations, such as OxygenFM, IFM, and KalimaFM. For many broadcasters, especially local and independent media groups, these costs are prohibitively expensive. Consequently, despite recent changes in the media environment, a number of broadcasters have been forced to continue to use the airwaves illegally. The proliferation of FM pirate radio stations operating illegally in post-revolutionary Tunisia, as well as the growth of online radio stations, is evidence of the need for greater access to the airwaves for new market entrants, and a tendering and licensing system that enables such access.[41] Pirate radio highlights the need for much more extensive reforms of the system that will create legal opportunities for a truly diverse range of broadcasters.

The final act of Ben Ali's presidency—lifting the Tunisian censorship regime—represented an important first step toward the creation of a free media environment in Tunisia. While this act has been celebrated by many and was reflected in Tunisia's removal from the Reporters Without Borders "Enemies of the Internet" list, it has not yet been accompanied by a corresponding effort to explicitly codify rights to freedom of expression and protection from censorship in the laws that govern wired and wireless access to the Internet. Moreover, while the government has discussed—and recommends in the INRIC report—recognizing Internet freedom as a global principle and enshrining the right to access information, it has only begun to take initial steps to enact these reforms. On September 4, 2012, the government announced the launch of a National Forum on Internet Governance, which Information and Communications Minister Mongi Marzoug declared to be the end of Internet censorship in Tunisia.[42] A few days later, Tunisia joined the Freedom Online Coalition[43]—"a global dialogue about the responsibilities of governments from around the world in pro-actively furthering

freedom on the internet"—and hosted the Coalition's third meeting in Tunis in June 2013.[44] It remains to be seen how these developments will impact the legal and regulatory framework in practice in Tunisia in the long term.

In terms of infrastructure and access, growth has continued while citizens have largely enjoyed unfettered access to the global Internet since the revolution. In December 2011, the Ministry of Information and Communication Technologies reported 12.5 million mobile subscriptions, with a mobile penetration rate of 116.6%, and an estimated 4.6 million Internet users, with broadband Internet penetration at around 9%.[45] In large measure, these users have been able connect to the global network unencumbered, particularly via social networks, which were heavily regulated before the revolution. However, the Tunisian Internet Agency continued to face filtering demands for months following Ben Ali's departure. In May 2011, the Military Tribunal requested the filtering of five Facebook pages, with which the ATI originally complied.[46] But the rise in Internet traffic in the post-revolutionary period created a technical dilemma for the ATI: with the existing machinery, the agency would have to significantly throttle the speed of Internet traffic in order to block the pages. Shortly thereafter, a civil lawsuit requesting that the ATI block certain pornographic websites was also filed. There are ongoing legal inquiries into whether the ATI will have to comply with requests of this nature going forward, even as it has attempted to remain neutral as an Internet exchange point and to enable Internet freedom for its citizens.[47] Moreover, the quality of connectivity and access also varies greatly from region to region, largely because Tunisia lacks an adequate universal service policy and maintains an unclear regulatory framework regarding the quality of service obligations on existing ISPs as well as fixed and mobile operators.

Recommendations for Spectrum Regulation and Reform in Tunisia

The public commitment to online freedom in Tunisia and to the ideals of freedom of the media and freedom of expression in the post-revolutionary period has been encouraging. However, fostering a truly democratic media environment requires a much broader set of policy reforms beyond Internet regulation. In particular, spectrum policy can be a powerful tool for enabling access to information, freedom of expression, and freedom of the media, and as such can and must be a part of the conversation as Tunisia seeks to overhaul its communications policies to deliver on the demands of its recent revolution. Moreover, this post-revolutionary environment remains a unique opportunity to explore different regulatory mechanisms, which could serve as a model particularly to similarly-situated countries in

the region, but also more broadly. In this section we seek to explore potential opportunities for spectrum policy reform which would ensure a freer media environment, and would be part of a shift to better reflect Tunisia's recent commitments to Internet freedom in practice. While the policies discussed in this section are complementary and could be implemented together, they are discussed here to highlight the different policy tools and considerations that the Tunisian regulatory authorities have at their disposal.

There are traditionally three regulatory approaches to spectrum management. Historically, most telecommunications have been governed under the "command and control" method wherein airwaves were considered to be a public good.[48] Tunisia's telecommunications sector was largely managed under this structure until the late 2000s, when the government began to liberalize its policies and adopt a modified market-based "property rights" approach,[49] which treats spectrum as a resource that can be bought, sold, and often traded on the open market.[50] More recently, certain policymakers and academics have advocated for an open access "commons" approach, which in its most radical incarnation posits that the customary licensing regime is unnecessary as technology has advanced to such a degree that devices can share spectrum without interference.[51]

Interestingly, those that favor a commons-based approach and those that favor property rights largely utilize the same language—those who support the latter argue that open access would lead to a "tragedy of the commons," whereas proponents of the commons approach worry about the "tragedy of the anti-commons."[52] Both sides argue that their management style preserves democratic freedoms and free market ideals.[53] Many Western countries, including the United States, Canada, and the United Kingdom, have adopted a hybrid approach to regulation, maintaining aspects of command and control while heavily investing in market-based solutions and enabling open access experimentation.[54] Tunisia and other MENA countries undergoing radical shifts in governance structures are uniquely situated to benefit from the lessons provided by these countries. The creation of a regulatory framework that can evolve quickly in accordance with technological and social changes is critical for the continued democratic and commercial growth of the Tunisian nation. Flexibility is particularly important in this enterprise. Every year, the amount of spectrum required to transmit data packets decreases; according to wireless pioneer Martin Cooper, spectral efficiency doubles every 30 months.[55] Even so, given the explosive growth in mobile subscriptions and broadband Internet access in Tunisia over the past decade, a new approach will be

necessary if Tunisia's regulators have any hope of keeping pace with growth and innovation going forward, maintaining the country's competitive edge in the region, and realizing the opportunities created by the revolution.

There are a number of key ways that spectrum policy in Tunisia can be redesigned to enable democratic access, facilitate freedom of expression, and encourage economic growth. In this section we outline recommendations for Tunisian spectrum regulation. These recommendations are meant to balance the interests of commercial actors and the public interest, and enable policies for technological innovation. We emphasize the need for the Tunisian government to construct these regulations in a participatory and democratic manner, building a legacy of transparency and accountability that counters the memory of the previous regime. Specifically, we touch on broadcasting licenses, wireless access, and open spectrum use.

Broadcast Licensing

One of the key decisions facing the Tunisian government is how to structure the licensing regime for radio and TV broadcasting so that it fosters the democratic spirit of the transition while encouraging economic growth. This balance may be difficult because, as has been mentioned previously, the line between the former regime and the incumbent broadcasting and telecommunications operators in Tunisia is blurry at best; while Ben Ali and his family have been forced out of the country, many of the allies of the previous government have retained a great deal of power and influence today. Currently, anyone hoping to obtain a new license or to legally broadcast in a vibrant and free media environment in Tunisia will find themselves hindered by a convoluted and highly subjective regulatory process.

However, there are steps the government can take to eliminate these problems. In line with the goal of increased transparency, the first step should be to provide the public with information about how different bands are designated for different purposes, which frequencies have been assigned and whether they are currently in use, and how to delineate the process for licensing and allocation. As the INRIC report suggests, this process will likely require a survey of the available frequencies. Once that information has been compiled and the licensing procedures have been defined, the logical next step in the process of democratic reform will be to give the public the opportunity to offer input on the licensing process, and to make available the justification for subsequent decisions in order to establish a precedent for implementing the criteria. Any further restructuring should be as simple and transparent as possible, with clearly defined objective criteria for licensing.

We submit that there are three key elements for the Tunisian government to consider while designing the broadcast licensing regime: plurality, development, and democratic participation. These elements would help create a broadcasting ecosystem that is diverse and accessible to a wide range of actors, and which relies on public and private organizations that are both commercial and non-profit. While the focus has often been on national and regional broadcasting, we also argue for the importance of promoting and protecting community broadcasting in Tunisia. As such, there are several important matters to emphasize in policy development.

Create opportunities for different types of broadcast media outlets, including community broadcasting: The license fee structure should take into account both the needs and financial abilities of different categories of broadcasters. TV and radio operators who intend

to broadcast nationwide should be regulated separately from community radio stations and television channels, and the ONT should strive to balance the differences between the two in their approach to licensing. The authors of Broadcasting, Voice, and Accountability outline a number of key requirements when attempting to create an enabling environment for community broadcasting.[56] First, community broadcasting should be recognized by law as a distinct type of broadcasting.[57] "Community broadcasting" can be defined as independent broadcasting that is provided by and for the members of a community in a particular geographical location or that belongs to a particular community of interest. Its primary purpose is to deliver social benefit and not to operate for private commercial profit.[58] It should be owned by and accountable to the community that it seeks to serve and it should provide for participation by the community at all levels.[59]

The European Parliament has affirmed that community media constitute a "significant component of participatory democracy."[60] The study commissioned by the Parliament concluded that community media fulfill local informational needs; enable citizens to play an active role in community life; act as a catalyst of cultural and artistic initiatives, local public interest activities and civil society advocacy; and encourage the direct involvement of typically underrepresented groups such as ethnic minorities and young people.[61]

Community broadcasting should be supported and encouraged by spectrum regulators through specific and explicit licensing arrangements which guarantee fair and equitable access to radio spectrum for civil society and community-based organizations. The license terms and conditions for community broadcasters, while consistent with the overall objectives of broadcast regulation, should also be designed to ensure that community broadcasting service characteristics are preserved for the duration of the license period. Furthermore, to ensure independence, community broadcasting should be supported by public funding and the funding processes should be determined and administered by an independent public body that is objective, transparent, and accessible to the public at large.[62]

Allow licenses for low power FM broadcasting: As part of its support for community broadcasting, the spectrum regulator could also offer licenses for low power FM (LPFM) broadcasting, following the examples of other countries that have implemented systems to encourage the creation of local, community content. In 2000, the U.S. Federal Communications Commission created the Lower Power FM Radio Service, which authorizes non-commercial, educational broadcasters to operate on FM bands at an effective radio power of up to 100

[57] Ibid., 156–160.

[58] A study commissioned by the European Parliament further defines community media as: "media that are non-profit and owned by or accountable to the community that they seek to serve. [They] are open to participation in program making and management by members of the community." European Parliament, "The State of Community Media in the European Union," report, Sept. 2007, accessed Dec. 13, 2013, http://www.cmfe.eu/docs/1166366638_The%20state%20of%20community%20media.pdf, iii.

[62] Buckley, Duer, Mendel, and Siochrú.

watts.[63] Applicants must pay filing and administrative fees, but if they are approved, the licenses themselves are provided free of charge. Their stations must meet certain environmental and equipment standards and agree to accept any interference on their channels from other licensed FM operators, relying on resources like the Low Power FM Channel Finder to identify available FM broadcast channels in their communities.[64]

Because of its extremely local nature (in the U.S. the standard range for an LPFM station is about 3.5 miles or 5.6 kilometers[65]), LPFM broadcasting is ideal for community broadcasters providing educational and cultural content, as well as transportation and public safety organizations. Allowing these broadcasters to share certain spectrum bands will help promote a free media environment and encourage local content targeted at a specific audience.

Wireless Communications

In addition to broadcasting, spectrum has the power to facilitate greater access to the Internet through the use of wireless technology. This mechanism for access is particularly important in some of the least-connected rural communities, which are isolated from coastal hubs by both physical distance and lack of virtual connectivity to information networks.[66] Recent studies have found that Tunisians in the interior provinces of the country are far less likely to use mobile phones, connect to social networks, or even have access to computers and the Internet than their peers in coastal areas. For example, a comparison of connectivity shows that while 85.8% of the population in the coastal Nabeul province are mobile subscribers, that figure is only 63.8% in the inland province of Kasserine. There are a total of 27 public Internet access points in all of Tunisia's inland provinces, compared to 232 in the coastal provinces.[67] The rural broadband gap points not only to economic inequality in Tunisia, but also to the comparative lack of infrastructure. This disparity in infrastructure is underscored by the fact that obtaining fixed-line access to high-speed Internet is comparatively easy in Tunisia's coastal cities, contributing to the already high rates of broadband penetration nationally. By contrast, the rural interior of the country will likely be opened up by the proliferation of wireless technologies, including mobile and fixed wireless Internet. Although wireless connectivity may only be a temporary measure as Tunisia develops the capacity to provide high quality fiber access to more and more areas of the country, it is a critical step that can help stem the growing divide between the interior and coastal areas of the country. Thus, Tunisian spectrum policy should be designed to specifically address the issue of universal access. To that end, we offer the following suggestions:

Exercise caution about spectrum auctions: Spectrum auctions have been utilized in many Western countries and are a hallmark of the "property rights" governance structure.[68] This approach may be extraordinarily tempting to developing nations because it can raise substantial sums of money for the government in a short time. These auctions should be considered with caution in Tunisia and only implemented with certain caveats. One of the biggest risks associated with the auction system is that large companies often have both the incentive and the financial resources to buy as much available spectrum as possible. In order to prevent incumbent providers from purchasing all of the prime spectrum at auction, any regulation regarding the practice of auctions should stipulate that certain bands can be sold only to smaller companies and non-profits, thereby ensuring that auctions are not simply an opportunity for incumbent providers to muscle out any competition.

In general, the auctions currently used to allocate spectrum licenses tend to favor operators with considerable market power, and this rarely leads to lower prices for the consumer.[69] Although these auctions have been successful by certain standards, they have also led to a highly concentrated market structure. The auction model encourages bidding from companies that intend to maximize profits from the spectrum they purchase rather than create competitive pressure that would lead to lower prices across the board for consumers. "Put another way, auction theory tells us that the type of auction mechanisms used to allocate spectrum, if they work well, will tend to maximize industry profits, and one expects industry profits to be higher with more concentration," write Milgrom, Levin, and Eilat.[70] A number of scholars, including Nobel Laureate Elinor Ostrom, have proposed alternative governance systems for managing "common pool" resources like spectrum. She outlines a number of principles that enable this type of management.[71]

Limit inactivity: It is also necessary to be wary of "spectrum squatting," a process that allows companies to buy up available spectrum as an anticompetitive measure and then leave it unused to create artificial scarcity. By limiting the amount of time that a company can maintain a license for fallow spectrum bands, the government can free up valuable spectrum for legitimate purposes. Similar measures have been adopted in Australia and elsewhere to positive effect.[72] In addition to encouraging a competitive market, these measures will prevent allies of the former regime from maintaining media control through exclusive spectrum licenses.

Permit license-exempt wireless use: To complement better policies governing the use of exclusively licensed spectrum, it is also critical that Tunisia allow and even encourage license-exempt wireless use. Examples from other nations show that it is often entrepreneurs operating on license- exempt spectrum and using widely available Wi-Fi equipment that provide the middle- and last-mile connectivity for communities without access to wireline

infrastructure. In the United States, for example, wireless Internet service providers (WISPs) have been integral in providing access to rural pockets of the country, primarily in areas where cable and telecom companies have avoided building the infrastructure for wired Internet service. Currently, there are over 2,000 WISPs providing service to approximately two million Americans, many of whom live in areas that would not otherwise have high-speed Internet access—or any access at all.[73] The opportunity for similar deployments exists in Tunisia today, as there is growing demand in rural areas to harness the economic potential that corresponds with increased Internet access, as well as a burgeoning desire among the country's residents to participate in the expanding community of online activism and political debate.

The relative ease of establishing robust connectivity in rural Tunisia using wireless technology was demonstrated poignantly in the refugee camps on the border with Libya during the Libyan refugee crisis of 2011. The Tunisian Red Crescent and the International Committee of the Red Cross set up makeshift camps to accommodate the large numbers of Libyans flowing across the border to escape the violence in their country, and Telecoms Sans Frontiers *(TSF)*, a non-governmental organization, assisted by providing emergency telecommunications relief, offering satellite phones for people to call loved ones, and establishing a satellite Internet connection for emergency workers in the camps. Using Wi-Fi routers, TSF was able to distribute quality connectivity throughout the camps, in an area of the country where Internet connections are normally few and far between and Wi-Fi hotspots typically require a license to operate.[74] While these connections were established ad hoc during an emergency situation, they highlight a real opportunity to provide permanent wireless connectivity in some of Tunisia's least-connected regions using similar technology.

It is even possible to go a step further if the regulatory agency allows for different power requirements on wireless equipment depending on the region. Many countries set a universal power limit on all Wi-Fi devices to prevent harmful interference. While this approach may be necessary in densely populated urban areas where the 2.4 and 5 GHz bands operate near or at capacity, it is far less of a concern in rural areas. Regional power requirements that allow far more flexibility in sparsely populated areas would facilitate greater wireless connectivity without having to lay more fixed-line infrastructure in those areas.

Utilize a portion of the digital dividend for rural development: Along these lines, the digital switchover, which is scheduled to take place in the MENA region in 2015, could further increase the amount of spectrum available for development in rural areas. As television broadcasting shifts from analog to digital, it will free up valuable spectrum on the lower end of the frequency range (often referred to as "white space") that enables wireless signals to travel further and cover greater distances. Rather than simply repurposing this spectrum and auctioning it off, the Tunisian government has the opportunity to use the digital dividend in the interest of the public good and invest in the long term growth and development of cur-

rently underserved areas of the country.[75] These lower-frequency bands would be beneficial if opened to small wireless Internet service providers on a license-exempt basis, facilitating expansion of access on frequencies that have better propagation characteristics than those traditionally reserved for Wi-Fi devices.

Embrace the potential of open spectrum and experimentation: Even if spectrum is heavily regulated for both commercial and public interest purposes, it is also critical that some bands of spectrum are reserved for creative uses and experimentation that can enable technological innovation. Wi-Fi is one of the most commonly cited examples of a revolutionary technology that was developed on the so-called "junk" band under a commons regulatory approach. In the 1980s, the United States made that portion of the spectrum available to anyone who complied with established technical requirements, which include power limits, equipment standards, and certification that mitigate potential harmful interference.[76] By lowering barriers to access, the commons approach drove the development of spectrum-efficient radio technologies including Ultra Wideband *(UWB)*, software-defined radios, smart radios and antennas, cognitive radios, and mesh networks.[77]

There are inherent risks involved in this approach—some say it can potentially lead to overuse of spectrum and excessive interference.[78] However, opportunistic access models *(which allow devices to operate on bands for which usage is low or intermittent, such as those reserved by governments for emergency use)* can work by relying on databases that track the frequencies that are in use and other means to allow devices to utilize spectrum that would otherwise lay fallow. The technology will continue to improve with further experimentation and use, but it will need regulators to provide opportunities for it to flourish.[79] At the same time, further innovation can be encouraged and enabled by shortening the time period for exclusive spectrum licenses, which will allow the government to shift spectrum policy more easily to take advantage of innovation. A movement away from long-term ownership or control models for spectrum and toward more temporary and flexible authorizations can ultimately lead to more efficient use of spectrum and further development of technologies that can mitigate the risks associated with open spectrum and sharing.

---

[75] The value of unlicensed spectrum, not only as a mechanism to encourage wireless innovation but also as an economically valuable resource unto itself, has been shown by a number of experts. In particular, Mark Cooper makes the case for unlicensed spectrum as a far more sustainable means for growth, arguing that "focusing on short term revenues that would be raised by auctioning licenses, while ignoring the immense value that unlicensed spectrum creates, which would increase revenues much more than auction yields, is a mistake… [F]ailing to make more high-quality spectrum available for unlicensed use would severely constrain the development of the unlicensed use model, which would retard the development of the entire wireless broadband sector, stifle innovation, drive up consumer costs for service, reduce long-term growth and slow job creation." Mark Cooper, "Efficiency Gains and Consumer Benefits of Unlicensed Access to the Public Airwaves: The Dramatic Success of Combining Market Principles and Shared Access," working paper, Jan. 2012, accessed Dec. 14, 2013, http://www.markcooperresearch.com/SharedSpectrumAnalysis.pdf, 5.

Beyond Licensing and Allocation: Creation of an Independent Spectrum Regulator

While the above recommendations are important, licensing and allocation alone will not suffice. Tunisian regulatory authorities must develop a system for policing unauthorized use of spectrum—from detecting, locating, and mitigating the problems created by interference to regulating content abuse. In contrast to many of the closed agencies that existed prior to the revolution, the Tunisian government should always strive for transparency and accountability in the way these issues are handled going forward. To that end, in addition to a clearly-defined and easy-to-navigate regulatory process, the government should create a viable mechanism for receiving feedback and mediating complaints. It should also provide a searchable database or registrar of license holders, so that members of the public can easily ascertain who has the rights to which spectrum bands in any given area. If civil society groups or other dedicated organizations commit to lobbying on behalf of smaller spectrum users and the public interest, the regulatory entity must be willing to listen to their concerns and include such organizations in any consultative processes.

To achieve many of the goals laid out in this article, Tunisia needs a comprehensive spectrum regulator who can clarify the roles of the various organizations and create a system that operates efficaciously. A specific agency tasked with identifying strategic convergent approaches to spectrum issues will help in balancing both local and national broadcasting and telecommunications needs, and can broaden the focus from improving Internet access in coastal cities, where fixed-line infrastructure is relatively easy to build, to including the rural interior of the country. A single spectrum regulator could also advocate for prioritizing spectrum policy in Tunisia's ICT regulatory structure and ensuring that frequencies are allocated in a manner that promotes economic growth, democratic access, and innovation. However, as Tunisia has already learned, in order to promote a democratic and free media environment, it is critical that this regulator be independent from the government.

Conclusion

Tunisia's influential role in the political transformations of the Arab Spring does not have to be limited to the events of 2010 and 2011. Regional analysis suggests that Tunisia has the power to continue to lead its global peers as it completes the process of constitutional reform and establishes itself as a true democracy. The technologies that played such a critical role in the revolution will undoubtedly continue to be influential going forward, and new forms of media and online civic activities will likely continue to play an important role in shaping Tunisian political and social development. As such, it is necessary for Tunisia to preserve the most valuable achievement of the revolution—freedom of expression. With the participation of all stakeholders, Tunisia should move to carry out the necessary reforms in accordance with this principle and craft a neutral and fair regulatory framework that is favorable to economic development.

CHAPTER 16

From Media Niche to Policy Spotlight: Mapping Community-Media Policy Change in Latin America

Arne Hintz

Canadian Journal of Communication 36, no. 1 (2011): 147–59.
https://doi.org/10.22230/cjc.2011v36n1a2458.

Introduction

Some of the most inspiring media policy innovations in recent years have emerged in Latin America. Originally a region with a vibrant grass-roots media landscape but few possibilities for such media to operate legally, it has seen significant social and political change, leading to the radical transformation of the normative and legal frameworks that guide and enable media development. In several countries, non-profit community media have not only been legalized, but have been moved out of niche positions and elevated to a leading force in social communication. This paper traces these developments across several countries of the region.

Policy change has coincided with increased academic interest in non-mainstream alternative, community, radical, citizens', or civil society-based media practices (e.g., Bailey, Cammaerts, & Carpentier, 2008; Coyer, Dowmunt, & Fountain, 2007; Downing, 2001, 2010; Howley, 2005; Rennie, 2006; Rodríguez, 2001; Rodríguez, Kidd, & Stein, 2009). This interest has been fuelled partly by the emergence of new media technologies that have allowed activists and grass-roots groups to create substantial media operations with a worldwide reach, partly by the continued spread of community uses of older technologies such as radio and video. Yet

BY-NC-ND

with the growth of the sector, policy questions have become more prominent. According to the World Association of Community Broadcasters (AMARC), "the lack of proper enabling legislation is the single principal barrier to [community media's] social impact" (AMARC, 2007, p. 5). Thus some community-media organizations (such as AMARC and the Community Media Forum Europe, or CMFE) and researchers (e.g., Hadl, 2010; Hintz, 2009; Milan, 2010; Reguero & Scifo, 2010) have increasingly been interested in the regulatory rules and norms that shape the media landscape: where they originate, how they are created, based on which values and interests, and how they shift.

In this article I will first introduce the contemporary dynamics of media policy at a global level and map several components that need to be considered if we want to understand the policy environment of a given media type or theme. I will then use this framework to investigate the policy environment of community media in Latin America, focusing on the countries of Argentina, Uruguay, Bolivia, Venezuela, Brazil and Chile. In the limited frame of this article, these developments and environments can only be outlined as a brief and necessarily sketchy overview. What this article will highlight is, in particular, a way of approaching the analysis of media policy change and a starting-point for investigating the specific policy context of community media.

Mapping media policy

Policy analysis has traditionally focused on national legislation, the implementation of legal texts, institutional design, administrative processes, and the existence or non-existence of support measures that may condition legal rules. National laws, as we will see below, continue to be a crucial framework that enables, constrains, or obstructs media operations. However, they increasingly intersect with developments taking place at other levels than the national one, and they are subject to both normative and material influences by actors other than the nation-state. Geographically, both the local and the national have "become embedded within more expansive sets of interregional relations and networks of power" (Held & McGrew, 2003, p. 3). As for the actors involved, global policy debates such as the World Summit on the Information Society (WSIS) and the Internet Governance Forum (IGF) have experimented with new forms of multi-stakeholder processes that include non-state actors such as civil society and the business sector. As arenas where actors and interests clash in a "battle for justifications" and where "consensus mobilization" (Khagram, Riker, & Sikkink, 2002, p. 11) is a prime target, such forums offer specific leverage for new "players." Latentand invisible policymaking, such as standard-setting by technical communities and informal actor alliances, have opened further doors for non-state actors to shape policy (e.g., Braman, 2006; DeNardis, 2009). The vertical, centralized, and state-based modes of regulation have thus been complemented by collaborative horizontal arrangements, leading to "a complex ecology of interdependent structures" (Raboy, 2002, p. 6) with "a vast array of formal and informal mechanisms working across a multiplicity of sites" (p. 7).

These multi-actor dynamics, taking place at "different and sometimes overlapping levels—from the local to the supra-national and global" (Raboy & Padovani, 2010, p.16), highlight the nature of policymaking as a process of political negotiation. This puts the focus on the interactions between, and the interests of, those involved, and on the conditions and

environments of interaction. Prevalent societal norms and ideologies underlie and advance specific policy trends (Freedman, 2008); favourable institutional settings may create "policy windows," that is, temporary openings for policy change (Kingdon, 1984); and stable "policy monopolies" may be broken up when political constellations change and the balance of power shifts (Meyer, 2005).

Whether a policy window is opened and a policy monopoly is shaken depends, not least, on the relative strength of social forces such as civil-society groups and the private sector. For our focus on community media, a particularly relevant aspect is the position of existing commercial and public-service media, including the extent of their commercial (through media concentration) and political (through links with the political elite) dominance. Another key dimension is the strength of social movements that support policy change by both public pressure and interventions into policy deliberations. In particular, the creation of networks and collaborations across movements, both domestically and transnationally, has been identified as one of the key factors for gaining political influence (Keck & Sikkink, 1998). Furthermore, individuals who occupy strategic positions in, for example, technology development or regulatory institutions may hold significant leverage in shaping policy development.

Finally, a focus on a region of the Global South, such as Latin America, may benefit from insights from postcolonial studies (e.g., de Toro & de Toro, 1999) that investigate how far Northern/Western concepts form the basis of social structures in non-Northern/Western societies and which continuities exist from colonial to current times. Policy analysis, with its focus on the governance of complex societies, faces the risk of setting the models prevalent in "advanced" societies as benchmarks for policy development in other parts of the world and thereby of assuming unidirectional policy change. Instead, it needs to illuminate differences and connections across societies and to question normative assumptions regarding the direction of development dynamics (Mihr, 2005).

The effort of mapping communication policy thus necessitates an enquiry into a broad range of dimensions: national laws and their implementation; regulatory regimes and institutional design; the technological, social, economic, and political context; interconnections between the local, regional, and global levels, including transnational influences; discursive, ideological, and normative frameworks; political constellations and government change; social movement formations; the strategic roles of civil-society organizations and individuals; and the interactions among diverse actors intervening in negotiations and norm-building processes. In the following sections, I will use these dimensions as a lens to look at community-media policy in Latin America.

Historical contexts of community-media policy

Over the past century, communication policy has passed through several phases (Ó Siochrú & Girard, with Mahan, 2002; van Cuilenburg & McQuail, 2003). Whereas during the 1950s, 60s, and 70s, international co-operation and public-service values were prominent, albeit with a persistent dominance of state actors, the 1980s and 90s saw the "unobstructed rollout of a neo-liberal model of media development" (Calabrese, 2004, p. 324), characterized by market- and industry-dominated regulatory approaches. For community media, both periods provided substantial challenges. The earlier phase, with its focus on state-led initiatives and

international negotiation, left little space for citizen-based media models, while the later emphasis on business initiatives, commercialization, and the private sector has largely neglected media that are non-commercial and civil society–oriented. However, some openings for their support have emerged throughout those phases. For example, the MacBride Report, the main outcome of the international debate on a New World Information and Communication Order in the 1970s and 80s, recognized the role of local, alternative, participatory, and decentralized media (International Commission for the Study of Communication Problems, 1980). At the World Summit on the Information Society of 2003 and 2005, community-media concerns were crushed by both authoritarian governments and business agendas, but side events, thematic WSIS-related conferences, and reports strongly emphasized the value of community media (Hintz, 2009).

Regional policy institutions have picked up the trail over the past decade. In 2001, the *African Charter on Broadcasting* recognized community media as a "third media sector" in a three-tier media landscape (UNESCO, 2001). Both the European Parliament (in 2008) and the Council of Europe (in 2009) adopted declarations in which they highlighted the important role of community media in advancing social cohesion, media pluralism, and intercultural dialogue, and in which they called for the legal recognition of community media in national media law, access to licences, and public financial support (Council of Europe, 2009; European Parliament, 2008). Likewise, the Inter-American Commission on Human Rights has acknowledged the centrality of community media for freedom of expression and access to information, calling upon states in the region to "legally recognize and reserve parts of the spectrum for this type of media, as well as to establish equitable conditions for the access to licences that recognize the difference of non-commercial media" (Inter-American Commission on Human Rights, 2009, p. 392). Governments in several countries have started to put such calls into practice. The British regulator Ofcom, for example, has allocated licences to hundreds of community radio stations since 2004. The government of India plans to have legalized 4000 community radio stations by 2013 (AMARC, 2010).

The ideological, media-structural, and political context in Latin America

Various dimensions of the global political-ideological context of communication governance emerged in Latin America with particular force. For many decades the state was dominant in social and economic life, partly as socialist or social-democratic state, partly (and more often) in authoritarian forms and as military dictatorship. From the 1980s, the neo-liberal model was enforced more radically than elsewhere, promoted by international institutions such as the World Bank, the International Monetary Fund, and the World Trade Organization, as well as domestic elites. The telecommunications sector was privatized and media businesses became highly concentrated. However, following deep economic crises, as well as the (related) legitimacy crisis of the neo-liberal paradigm, left-wing governments were elected across the continent in the early 2000s. Their politics, rhetoric, and policies have differed, but they have largely stalled or reverted privatization processes and have put stronger emphasis on public services. Countries including Venezuela, Bolivia, and Ecuador have recently carried out re-nationalization processes in the telecommunications sector, and new media laws have radically changed the environment for community media.

Community radio is immensely popular in Latin America due to its embeddedness in local society. Often it represents the only media outlet offering local news, programs on local issues, and programs in local languages. The cost of a radio set is low, collective use is possible, literacy is not essential, the use of radio waves requires only limited investment, and it is thus the most accessible media platform (e.g., Girard, 2003). A large number of grass-roots radio stations have existed all across the continent, and the beginnings of community radio as such are often traced to radio initiatives in Bolivia and Colombia earlier in the 20th century (Rodríguez, 2001). However, community radio has largely been excluded from access to frequency licences due to discriminatory laws and regulatory practices. In several countries, it remains explicitly forbidden; in other countries, allocation procedures, such as discretionary handing out of licences by the government to specific "friendly" operators and auctioning off of licences to the highest bidder, have practically prevented its legal existence. Where it is legally allowed to exist, laws are often highly restrictive regarding range and funding, radio stations are relegated to the border areas of the spectrum and are subject to conditions such as bans on carrying advertising or on political content. This situation has long been criticized by activists and scholars as a violation of freedom of expression and an abuse of state power to silence diverse voices (Gómez, Aguerre, & Eliades, 2009).

For decades, the private sector dominated ownership structures, with 85% of radio broadcasters under private ownership in 1993 and a strong role played by media corporations that also controlled other media businesses (López Arjona, 1993). Several large transnational enterprises, connected with each other both horizontally and vertically, have been struggling for television market shares, including Globo from Brazil, Televisa from Mexico, the Venezuelan Grupo Cisneros, and the Argentinean corporations Clarín and Telefe (Mihr, 2005). The telecommunications sector is even further concentrated, with Spanish telephony giant Telefónica and the Mexican América Móvil approaching a virtual duopoly in the regional market (Mastrini & Aguerre, 2009).

A significant aspect of the media situation in the region is the contrast between the wealth and international strength of multimedia conglomerates and rural areas that are largely cut off from media access—"an intermixing of the First and Third Worlds" (Callaos, 1999, p. 252). Newspapers, in particular, are typically concentrated in the larger cities and oriented toward urban elites. Proximity to elites and close connections between governments and press organizations are thus further characteristics of the media context. Across the region, the political environment of media is traditionally characterized by "cozy relations between large media business and governments" (Waisbord, 2010, p. 134; see also Fox & Waisbord, 2002).

The recent political changes have started to weaken these long-lasting ties. Moreover, governmental and administrative change has been carried by a wave of social movements and protests against the predominant social and economic order and has thereby reflected the strengthened role of civil-society groups and social movements. The Zapatista uprising in Mexico in 1994 provided a starting point for regional mobilizations as well as global struggles against neo-liberalism and, eventually, for the alter-globalization movement and its protests against summits of major international institutions. Indigenous uprisings followed in many countries, such as Ecuador, Bolivia, Guatemala, and Brazil. The economic breakdown in Argentina in 2001 led to an outbreak of massive protests that took down several successive governments and carried the slogan "*que se vayan todos*"—"they all must go." A year later in

Venezuela, President Chavez was ousted by a coup that was supported by the commercial media, but he was brought back into power by a popular movement that included community and alternative media. These moments in the recent history of the region, and many others, led to a reactivation of social movements as "the social and organizational fabric, seriously affected by adjustment policies and new mechanisms for repressing and criminalizing social protest, began to gradually recover" (León, Burch, & Tamayo, 2005, p. 25).

Meanwhile, regional linkages between movements emerged and broad networks were created, such as the international network Via Campesina and its regional grouping, the Latin American Coordination of Rural Organizations (CLOC). Common campaigns emerged, such as the Continental Campaign Against the Free Trade Area of the Americas and the Campaign Against Payment of the Foreign Debt. The intense convergence and co-ordination of movements has been highlighted, not least, by the World Social Forum, which originated in the region (León, Burch, & Tamayo, 2005, p. 29).

Communication infrastructure, media structures, and media messages have become vital concerns for these networks and campaigns. Larger movements such as Movimento dos Trabalhadores Rurais Sem Terra (MST) from Brazil have created their own media, including newspapers and radio stations. The right to create media has been a central piece of the communication agenda of social movements in the region, together with access to media and communication infrastructure, both "old" and "new," and the democratization of the media. This agenda has been framed by a call for communication rights that regards communication as a social right, rather than a commodity, and as an interactive process, furthering the active participation of the citizenry in social and political deliberations and developments. These concerns thus respond directly to some of the core deficiencies of the Latin American media systems (Girard, Camacho, Vannini, & Roemersma, 2010).

Snapshots of community-media laws and regulations in Latin America

Argentina is an appropriate starting point for a little policy tour around South America because it illustrates the dramatic changes between, as well as continuities running through, the "old" and the "new" regimes. The basis for media policy has been a law that was passed during the military dictatorship that favours private commercial media and excludes community media. It was amended and reformed during the neo-liberal decade of the 1990s, allowing further privatization, cross-ownership, foreign ownership, and a significant increase in the maximum number of licences that a company can hold, thereby supporting media concentration. Traditionally, media policy in Argentina thus combined authoritarian and neo-liberal concepts (Marino, 2009).

Following economic breakdown and social unrest, the new Kirchner government began moderate revisions of the regulatory framework in the mid-2000s and allowed non-profit organizations to be licencees, thus legalizing community broadcasting. However, the allocation process provided significant bureaucratic obstacles, and the regulatory agency remained weak and dependent on the executive. In 2009 a new legal environment was created with the adoption of Law 26.522 on Audio-Visual Communication Services, which "transformed Argentina in [sic] one of the best references of regulatory frameworks to curtail media concentration and promote and guarantee diversity and pluralism" (AMARC, 2010, p.

10). In particular, the law recognizes three sectors of broadcasting—state, commercial, and not-for-profit—and guarantees a 33% share of the radio frequency spectrum for each sector, making it the most radical framework in support of community media yet. In 2010 the law was temporarily suspended by the Federal Appeal Court of Mendoza, following strong opposition to the new law and a publicity campaign by the Clarín media group, the largest Argentine media corporation.

Historically, neighbouring Uruguay provided a good example of a dominant feature of the "old" policy regime across the region, that is, the arbitrariness of media licensing and the role of political–business alliances. Precise rules and criteria for granting, revoking, and renewing broadcasting permits did not exist until recently, licence periods were practically unlimited, supervision of the use or abuse of licences was absent, and typically the president handed out frequencies to political and business allies (Waisbord, 2010).

The election of the left-wing coalition Frente Amplio in 2005 represented a fundamental break with political traditions in the country, and the new government swiftly created two laws legalizing and regulating community media. The laws provide a clear definition of the sector, allocation criteria that are based on its social goals, and highly transparent and participatory allocation and renewal procedures. They also set principles for the administration of the radio-electric spectrum, stating that it "is a common heritage of humanity ... and, therefore, the equitable access to frequencies of the entire Uruguayan society is a general principle of its administration" (quoted in Lanza & López Goldaracena, 2009, p. 4). At least one third of the spectrum is to be allocated to community media. The state has also started to revoke licences that were used for fraud or otherwise violated the law.

Together with Argentina, Uruguay is seen as a model country for progressive policy change. Nevertheless, some legislation from the time of the military dictatorship continues to be in force and to provide wide discretion to the government in administering the radio-electric spectrum. As in Argentina (and most other cases reviewed here), the lack of independence of the regulator from the executive and the persistent power of the executive to hand out broadcast concessions, as well as the lack of a comprehensive response to existing media concentration, pose questions regarding the sustainability of the current changes.

Political change in Bolivia, with President Evo Morales taking office in 2005 and his Movement Toward Socialism (MAS) forming the government from 2006, proved to be an even greater landslide than in Uruguay. Community media were legalized by decree in 2004, 2005, and 2007, and the national telecommunications provider was re-nationalized. A new constitutional article on "social media" was introduced, calling for the state to support community media. The government moved beyond mere legalization by creating a national network of indigenous people's radio stations in response to the particular diversity of social and ethnic origins and languages in the country (Aguirre Alvis, Torrico Villanueva, & Poma Ulo, 2009).

As in Uruguay, the new laws and decrees in Bolivia display a thorough understanding of the characteristics of community media, with a few shortcomings, however. Community media are largely seen as local media and are limited in geographic scope; they are not allowed to carry advertising, and no specific percentage of the spectrum has been reserved for them. The new indigenous stations that are the result of government intervention and are dependent on government support are called "community media," which confuses the understanding of that term and concept. Furthermore, licence allocation is exercised by a mix

of several institutions, disturbing the transparency of the process, and overall the executive retains significant discretion in interpreting and applying the law (Aguirre Alvis, Torrico Villanueva, & Poma Ulo, 2009).

Venezuela provides a similar picture, unsurprisingly, due to close collaborations between the current Bolivian and Venezuelan governments. A new telecommunications law was adopted in 2000, just over a year after the new Chavez government had taken office. The law regularized spectrum allocation, after decades of arbitrary and political licence provision, and legalized community radio and television. Since then, the regulator has given out a large number of licences to community media. However, the complex allocation procedure provides numerous bureaucratic hurdles, community media are (as in Bolivia) restricted to a concept of local media, and while financial subsidies are available, they are widely seen as a double-edged sword, as they may jeopardize these media's independence (Urbina Serjant, 2009).

Regulatory inconsistencies persist, as the law and specific regulations are sometimes contradictory, and so do regulatory gaps—for example, regarding the renewal and termination of licences, for which few clear criteria and procedures exist. As a result, opportunities for discretion by the relevant institutions persist, as well as long procedures for allocating and renewing licences. The regulatory institutions remain heavily influenced by the government, and despite promising changes, Venezuelan media policy is still characterized by an "institutional weakness of the regulatory process" (Urbina Serjant, 2009, p. 8).

In all these countries, civil-society mobilizations have played an important role in creating policy change, and civil-society agendas could be transformed into policy through movement–government connections, either because of the existence of allies in power or because of individuals from the movements who took up government or regulatory positions. The Argentine media law was drafted by a communications professor and AMARC policy consultant, followed by extensive consultations with civil society and other sectors, and the final text was physically brought to parliament for adoption by a procession of 20,000 citizens, making it a "law of the people" (personal interview with Damian Loreti, Montréal, QC, February 11, 2011). The wording of the Uruguayan law was based on a draft submitted by civil-society groups, and besides its media-related content, it has opened institutional spaces for citizen participation in the administration of the spectrum. Its adoption was influenced by significant pressure from a broad civil-society coalition of media, labour, educational, and human rights organizations, and by the advocacy work of AMARC, with one AMARC expert becoming the head of the government's communications department (Waisbord, 2010). In Bolivia, AMARC participated temporarily in the process of allocating new licences to community media, and civil-society groups were involved in formulating the respective policies. Yet in that case, extended possibilities for participation only existed during a brief window after President Morales came to power and were later reduced or revoked.

Civil-society mobilizations and government change also occurred in Brazil, but not with the same outcome. Traditionally the country has had a fragmented, complex, and sometimes contradictory regulatory landscape, largely reflecting the traditionally close connections between the business sector and political elites. The federal constitution of 1988 highlights the social aspects of communication but does not recognize community media. Several of its articles (e.g., the rejection of monopolies and oligopolies) have not been transferred into laws and concrete regulations. There is no systematic supervision of whether stations com-

ply with legal and regulatory obligations, and sanctions are rarely applied: "The decision is always to renew, even with notorious violations by stations towards their legal obligations" (Moyses & Gindre, 2009, p. 19). Most new licence grants have to be processed first by the Department of Communications and then authorized by the National Congress. In theory, this may allow for parliamentary control and transparency; in practice, it leads to long delays and an overly complex process.

In Brazil, community media were legalized in 1998 and thus earlier than in the other examples. However, they face significant bureaucratic barriers in the application process, severe limitations in terms of transmission power and range, a lack of public funding, and restrictions to financing models such as advertising. As most community radio stations have to operate with few resources, sponsorship by political groups is common, and political dependency is a likely result. Meanwhile, thousands of community radio stations are broadcasting in Brazil without licences, making it one of the most vibrant grass-roots radio landscapes worldwide. However, and in contrast with the lack of supervision of commercial radio stations, unlicensed community radio stations are heavily repressed. According to some accounts, up to 10 radio stations are shut down every day, and up to several thousand per year (Moyses & Gindre, 2009).

The end of our tour brings us back to the southern end of Latin America, to Chile, where the links between the military dictatorship and neo-liberal policies can be traced even more clearly than where we started, in Argentina. The constitution, the General Telecommunications Law, and many regulations that are in existence today were adopted during the dictatorship. Radio frequency allocation follows strictly commercial principles: concessions are allocated by auction to the highest bidder and can be sold further, there is no limit to the number of frequencies that an owner can hold, most concessions are granted for 25 years, and renewal is comparably easy, all of which favours large media operations and, particularly, the incumbent stations. For TV, some anti-monopoly regulations are in place, but they have not prevented the Chilean media landscape from becoming highly concentrated. As elsewhere across the region, there are indications that this type of commercial allocation is intertwined with political favouritism (La Morada Women's Development Corporation, 2009).

Community radio is only allowed as so-called "minimum-coverage" radio and is limited to 1 watt of transmission power, which usually restricts coverage to the immediate surroundings of the station. Concessions for community radio are given for only three years, and public funding is not provided. Furthermore, given the significant bureaucratic and financial hurdles, the current "minimum-coverage" option is not a feasible opportunity for most non-profit community and social groups. A new law on community radio, which may alleviate some of these problems, is currently being debated.

Conclusion

In many countries of the region, the last decade has seen dramatic changes in media policy. Whereas previously communication regulation had been characterized by a mix of authoritarian political traditions and neo-liberal ideologies and was geared toward political and business elites, new legislation in several jurisdictions has helped to expand citizens' access to communication infrastructure and has provided clearer licence allocation procedures. A key piece

of policy change has been the legalization of community media and their integration into the national media mix as a legitimate and important sector within a three-tier media landscape.

However, community media are continuing to face serious obstacles. Little or no public funding is available, bureaucratic barriers often make the process of obtaining a legal licence a daunting exercise, and various restrictions on their operations persist, such as those regarding coverage and content. The weakness of regulatory agencies and their lack of independence from the state are visible across all the exemplary cases. While there have been promising new laws and regulations, structural change has not kept pace, and media authorities continue to depend on executive power. If (or rather, when) the current community media–friendly governments leave office, regulatory practices may be changed or revoked. From a community-media perspective, it seems desirable that the structural and institutional environment that frames policymaking be strengthened so that the current transformations become sustainable.

The snapshots of media laws and their implementation have highlighted the persistent role of national legislation and regulation in enabling or obstructing media operations. However, this brief overview has also shown that national policymaking has to be understood in the context of an international and multi-actor environment. Government constellations, intergovernmental co-operation, multinational norms and pressures, political traditions, ideological change, social mobilizations, and the strategic roles of civil-society organizations as well as individual experts, among many other factors, have framed policy change and created trajectories for understanding policy problems and needs. Further research on the scope and extent to which these various dimensions affect media policy change in Latin America and elsewhere may provide us with a clearer conception of how the legal and political frameworks within which media operate are constructed.

CHAPTER 17

Community Radio Contradictions in Canada: Learning from Volunteers Impacted by Commercialising Policies and Practices

Gretchen King and
Omme-Salma Rahemtullah

Journal of Alternative & Community Media 4, no. 4 (2019):
20–36. https://doi.org/10.1386/joacm_00064_1.

Abstract

Community radio has been defined by the United Nations Educational, Scientific and Cultural Organization (UNESCO) as promoting non-profit ownership of stations and volunteer participation. The increasing commercialisation of community radio in Canada, evident in changing station practices and regulatory policies, has resulted in the erosion of volunteer run governance and programming. This article draws on community media, anti-oppression, and third-sector studies literature to investigate the experiences of volunteers from two stations, CHRY in Toronto and Radio Centre-Ville in Montréal. Current Canadian Radio-television and Telecommunications Commission (CRTC) regulations define community radio 'by virtue

BY-NC-ND

of its place in the communities served.' This article concludes that reducing the engagement and empowerment of volunteers in community radio programming and governance limits the place of community radio in the community. The authors will also identify best practices that are needed to re-centre community radio within the community while ensuring a sustainable nonprofit community broadcasting sector.

Keywords

community radio, CHRY, Radio Centre-Ville, CRTC, volunteers, commercialisation, governance, policy

Introduction

Canada, described as the 'birthplace of community radio' (CRTC, 2008), is home to a long history of non-public, non-private radio practices and policies designed to provide community access to the airwaves. Today, Canadians have access to 182[1] licensed community radio stations, the majority of which are located in the provinces of Ontario and Québec where more than 60 percent of the country's population lives. The only local radio broadcasting from many of Canada's rural towns and isolated hamlets is either a community radio station or an Indigenous-run[2] radio station. Privately-owned commercial radio stations and media conglomerates overcrowd FM dials in urban areas (MCRP, 2017). Additionally, Canada's largest cities are often served by more than one community radio station. Despite the prolific development of community radio across Canada, the hyper-commercialisation of the FM dial, especially in major radio markets like Montréal and Toronto, is producing changing practices and policy shifts that threaten the sustainability of community access radio broadcasting by and for underrepresented communities.

Within the literature on community radio, defined by the United Nations Educational, Scientific and Cultural Organization (UNESCO) as promoting non-profit ownership of stations and volunteer participation, there is a noticeable lacuna on the impact of policies and practices on community radio volunteers. The majority of scholarship published concerning community radio prior to the 2000s was descriptive, summarising a station's origins, programming practices, and/or funding structures (Rodríguez, 2001: 11). In the decades after, academics produced theoretical works that focused largely on community radio's contribution to democratising communication, participation and empowerment, social movements and political change, and countering the status quo (Ferron, 2012; Rauch, 2015; Rodríguez, 2001). Several studies observe that community radio engages community participation (Girard, 1992; Gumucio Dagron, 2001; Rodríguez, 2001; Sussman and Estes, 2005), however, only a handful examine the impact of volunteer engagement practices within community radio stations (Anderson, 2011; Fairchild, 2001; Khan, 2010). Gaps are evident in the theorisation of community radio, including an absence of works concerning content analysis, internal

[1] This number is the total of the following licence service types issued by the CRTC: Community (128), Community Type B (4), Community Type A (1), Community Developmental (2), and Campus (47). Retrieved on April 25, 2018, from: https://applications.crtc.gc.ca/radio-tv-cable/eng/broadcasting-services-List.

[2] The CRTC has licensed 53 Native B type stations, but hundreds of more Indigenous communities operate unlicensed local radio stations. See: https://applications.crtc.gc.ca/radio-tv-cable/eng/broadcasting-services-List?_ga=2.201279598.1362631076.1525613219-318507918.1484669306.

debates and contradictions, and the impact on audiences (Downing, 2003; Ferron, 2012; Hadl and Dongwon, 2008; Rauch, 2014). This article builds on current community media scholarship by drawing on anti-oppression and third-sector studies literature to investigate the experiences of volunteers from two stations, CHRY in Toronto and Radio Centre-Ville in Montréal. Both stations have decades of experience in community radio broadcasting, but recent changes to regulatory policies underpin ongoing internal conflicts over station practices that de-centre volunteer participation in governance and programming.

Based on comparative case study research on the sustainability of community radio in Canada, this article views the impact of commercialising Canadian Radio-television and Telecommunications Commission (CRTC) policies and community radio practices through documenting the experiences of the volunteers from community radio stations in major radio markets.[3] This methodology is informed by third sector studies frameworks offered by Fischer (2014: 458) that are useful for assessing the impact of governance practices, including investigating the distribution of power and decision-making processes, evident transparency in knowledge and information exchanges, inter-institutional dialogue, and greater accountability. Combining anti-oppression literature with third sector researchers who focus on transparency and accountability offers an opportunity to explore the conflictual realities of community radio stations, including 'core tensions' identified by Fairchild (2001: 7) among community radio stations in Canada and 'inter-community discord' described by Huesca (1995: 105) that required a response by community radio stations in Bolivia. The corruption of power and privilege is harmful to the sustainability of any community radio station (Hancock and Khan, 2004). This view of conflict helps illuminate the processes of exclusion experienced by some community radio volunteers.

Challenging oppression and inequality in the media is part of the mandate of community radio in Canada (NCRA, 1987). Where Dominelli (2003) documents the central role of anti-oppression literature in social work, scholars like Khan (2010) demonstrate the value of this understanding in evaluating the volunteer training practices facilitated by community radio stations in Canada. Drawing on anti-oppression literature to inform approaches borrowed from third sector studies allows this research to interrogate community radio policies and station practices in order to inform sustainable mechanisms for participation and accountability. This approach is necessary according to practitioner and scholar Coyer (2011), who examines the 'normative view' of community radio. Coyer draws on Williams (1985) who asserts, the word 'community' is always used positively. Because community radio 'is typically seen as a good thing' and 'it tends to aspire to some form of inclusiveness,' Coyer (2011: 170–1) suggests this orientation necessitates a more critical review of each station 'to identify who is "in" and who is "out;" who belongs and who does not'. Thus, using anti-oppression literature offers a lens for viewing the processes within community radio stations that may include or exclude volunteer members.

The above literature informs the questions guiding this research that investigate how community radio volunteers are experiencing changing station practices and CRTC policies. In addition, the impetus for this study is also informed by practitioner knowledge. The authors of this paper are not isolated academics that research community radio, but rather community

[3] Major radio markets identified by the CRTC include, Montréal, Toronto and Vancouver. See https://crtc.gc.ca/eng/publications/reports/BrAnalysis/radio2014/radio2014.htm.

radio practitioners with academic experiences who came together with other advocates to form the Community Media Advocacy Centre (CMAC).[4] Founded in 2015, CMAC is a not-for-profit organisation that supports the self-determination of Indigenous, racialised and disabled peoples in the media through research, relationship building, advocacy, and learning. CMAC was conceived of in part as a response to the very problematic this paper seeks to address—the marginalisation of diverse volunteers as a result of commercialising community radio station practices and policies. Where national associations representing community radio stations in Canada have advocated for changes in distribution models but have yet to recognise the impact of changing station practices,[5] CMAC's mandate and research agenda is interested in the future of community media. CMAC's practitioner experience also aided data collection, where CMAC members were able to access volunteers from CHRY and Radio Centre-Ville because they themselves are part of these communities. In addition to drawing on semi-structured interviews with five volunteers from CHRY and Radio Centre-Ville on changing community radio practices, other primary sources of data for this study include two interviews conducted with experts in non-profit and community radio governance and secondary sources consisting of CRTC regulations, station policies, press releases, media coverage and grey literature. This article analyses these data to investigate the challenges and opportunities for sustainable community radio in Canada with the goal of enriching not only current academic scholarship, but also the views of all advocates for community radio, including community radio volunteers, stations and their representative associations.

Community radio fissures in the state of Canada

In the decade before public policy in Canada distinguished between professional and community media (1974), Indigenous nations, social movements, refugees and immigrants took to the airwaves. Briefly, the first community-owned radio stations were established with experimental licences issued by the regulator in the 1970s. The government was responding to a decade of unlicensed radio broadcasting used as a tool of survival and resistance. Across northern Canada, Indigenous nations installed trail radio networks to link rural and isolated communities. In cities and towns across Québec, radio broadcasts organised by labour, feminists and community movements helped to amplify the Quiet Revolution (Gonzalez Castillo, 2014: 585–585). Similarly, in cities like Vancouver and Montréal, community media activists set up radio as a tool for organising low-income communities. At the time community radio practices were regulated through licence conditions. This history of community radio in

[5] See Paragraph #23 of the ARC-Canada/NCRA/ARC-Québec joint submission for CRTC 2017-359-2:
In the Community Media Advocacy Centre's ("CMAC") submission in part one of this proceeding, they stated that "Community radio… has lost most of what made it distinct since changes were made to the Community Radio Policy in 2010. Stations, according to the policy changes, are no longer predominantly run by volunteers, rather now community radio is mandated to foster only some volunteer participation." To our knowledge, the changes in the c/c sector described by CMAC have not occurred, nor have we observed any evidence from our 149 licensed member stations that the changes arising from the 2010 Community Radio Policy have reduced the number of volunteers at c/c stations in any meaningful way. Our understanding is that the 2010 policy does not differ from the 2000 policy in term of the expectation that c/c stations will incorporate volunteers into their activities.

Canada precedes the development of specific policies and the issuing of hundreds of licences. Regulation in Canada began with the 1991 Broadcasting Act, which defines a broadcasting system that 'comprises public, private and community elements' (Section 3.1.b), and the CRTC's Policy Proposals for Community and Campus Radio (CRTC 1991-118) that developed the first policy issued in 1992 (CRTC 1992-38).

Previous to the development of policies, the CRTC issued several experimental licences with conditions to serve communities in 1974. Among these new non-professional stations run by community-members was the radio station at Laval University in Québec City established by students inspired by broader social revolutions in the province lead by the Front de Libération du Québec (Gonzalez Castillo, 2014). In Pond Inlet, the Nishnawbe Aski Nation set up a community-owned radio station in northern Ontario, founding the first licensed First Nation radio station in Canada. In Vancouver, community media activist's Co-op Radio started broadcasting to bring together low-income neighbours in the Lower Eastside area of the city (King, 2017a). These community-run stations provided representation in the broadcasting system by populations otherwise marginalised in media. Community radio continued to spread in urban areas among immigrant and refugee communities, including the creation of Radio Centre-Ville in 1974 to provide programming in multiple languages serving non-francophone communities in the St-Louis neighbourhood of downtown Montréal. Today, the multi-lingual licence of Radio Centre-Ville remains the only community radio station licensed to broadcast in multiple languages other than French and English.

By the 1980s, tens of community radio stations were operating across Canada and community broadcasters began forming regional and national associations. Diverse groups representing campus and community radio stations established the National Community Radio Association (NCRA) to represent their interests at the CRTC. The NCRA membership resolved in 1987 that 'community broadcasting serves the needs of socially, culturally, politically and economically disadvantaged groups in society' in response to mainstream media that 'reinforces social and economic inequities that oppress women and minority groups' (NCRA, 1987). Similarly the Alliance des radios communautaires du Canada (ARC-Canada) and the Association des radiodiffuseurs communautaires du Québec (ARC-Québec) were established to represent the needs of francophone and Québecois community broadcasters (King, 2017a). During this time, the CRTC established separate policies for Indigenous broadcasting (1990), community radio (1992), and ethnic broadcasting (1999). These licence classes promoted the development of linguistic and cultural solitudes on the FM dial by issuing separate English, French, Native and Ethnic licences, with the exception of Radio Centre-Ville's licence condition to provide multi-lingual programming.

Throughout the 1990s, these new CRTC policies underpinned changes in the community radio sector. The Ethnic Broadcasting Policy established a profitable, commercial ethnic radio sector and set out limits on the ethnic content aired by community radio stations (CRTC 1999-117). Ethnic producers and audiences previously served only by community radio stations, like Co-op Radio and Radio Centre-Ville mentioned above, found representation on a more commercialised radio dial. For example, new waves of immigrants and refugees to Canada from Arab and Muslim communities who did not find representation within community radio stations opened commercial stations (Marouf, 2015). During this period, new CRTC policies and changing community radio practices across Canada began to transform

the sector established to provide radio by and for diverse groups marginalised by private and public media.

In 1999, there were 49 community radio stations in operation across Canada (CRTC 1999-75) and in the decades that followed the number of stations on-air more than doubled. Many of the newly licensed stations served homogenous (white) rural communities across Canada, a reality that transformed the community radio sector by contributing to the under-representation of diverse groups among community radio staff and among the membership of the above-mentioned national community radio associations (Marouf, 2015). The 2000s would continue to see shifting practices and policies that marginalised diverse programmers and audiences within community radio stations. These changes were in part influenced by external pressures, like conservative organising that targeted the social and political agenda of community radio, successfully defunding and destabilising at least one campus-based community radio station in Waterloo.[6] However, internal practices concerning employment and governance practices contributed to the under-representation of women, ethnic and Indigenous peoples, and people living with disabilities among paid staff and boards of community radio stations (Bonin & King, 2017). Rather than prioritising equity in community radio stations, associations like the ARC-Québec invested in professional development among its members and sustaining paid staff (Light, 2013). Even at the NCRA, changing priorities produced a mission statement in 2003 that neglects to mention the 'under-represented voices' and 'disadvantage groups' that founded the association (NCRA, 2003). Such programming and staff changes within community radio stations also accompanied a decrease in community radio news staff and shows (King, 2017b).

During this period of growth and transformation within the sector, the CRTC initiated two reviews of the community radio policy in 1999 (CRTC 1999-30) and 2009 (CRTC 2009-418). During the 1999 review, the ARC-Canada and ARC-Québec called for the elimination of advertising limits and the NCRA opposed such changes as 'contrary to the mandate of community stations' (CRTC 1999-75). For the 2010 review, the NCRA, ARC-Canada, and ARC-Québec prepared a joint intervention. In addition to seeking 'flexibility' in advertising limits (CRTC 2010-499), the associations also advocated for changes to the definition of community access in radio governance and broadcasting. Where the former policy states community radio 'provides for membership, management, operation and programming primarily by members of the community at large' (emphasis added, CRTC 2000-13), the changes put forward by the associations during the last review defined stations through 'community ownership' and programming that is only 'in-part' produced by volunteers (CRTC 2010-499). Other changes in the new policy supported by the associations reduced spoken word programming from the 25% requirement for 'community-oriented' public affair and news shows (CRTC 2000-13) to a minimum of 15% spoken word content (CRTC 2010-499). Notably, the spoken word category is generically defined in the revised policy as 'local' and therefore can now account for any words spoken into the microphone regardless of the type of program or

[6] Building on the successful defunding of CKMS in Waterloo, the Ontario Progressive Conservative Campus Association held a series of workshops across university campuses in 2009 on how to dominate campus discourse through defunding campus based community radio stations. See: https://rabble.ca/babble/canadian-politics/conservative-party-strategy- take-over-student-unions-exposed.

content.[7] Such changes have led to a reduction in locally-produced public affairs and news programming aired on community radio in Canada since the 2010 review (King, 2017b). In his dissenting opinion concerning the last community radio policy review led by the CRTC,[8] Commissioner Marc Patrone noted changing station practices and predicted 'that community radio may gradually become something more akin to a commercial venture.' Since that time, community radio practices that for decades provided underrepresented communities access to broadcasting have increasingly prioritised airing professionally produced programming that is attractive to advertisers (Light, 2013).[9]

In Canada, the origin of community radio practices may be rooted in the resistance to anglo-colonisation by diverse groups of Indigenous nations, Québecois social movements, refugees, and immigrants; however, changes in CRTC policies and commercialising community radio practices depart from this social and political history. Today, community radio in rural and isolated areas of Canada is often the only local radio, broadcasting to a geographical community defined by colonialism and the uneven development of communication infrastructure. Diverse communities who helped found community radio are underrepresented in governance and programming at some community radio stations. However, it is in Canada's cities where conservative organising, economic pressures and policy changes are fermenting fissures in community radio. Contradictions created by for-profit, commercial programming and governance practices within some of the country's oldest community radio stations have de-centred the needs and interests of station volunteers. This research provides the following case studies that document community radio volunteer experiences to investigate how the community is experiencing commercialising community radio station practices and policies.

Case study of CHRY

On 30 April 2015, as the many diverse volunteers of CHRY gathered for their semi-annual volunteer general meeting (VGM), they had no idea that by the end of the meeting they would no longer be part of the station they held dear to their hearts. After the procedural components of the meeting—reports from staff of each department, plans for the annual fundraising campaign, and the financial report—the program coordinator announced that as of midnight 30 April every program at CHRY would effectively be cancelled. Though CHRY staff branded this as a non-renewal of programming agreements (CHRY, 2015), volunteers were told that they will not be returning to their shows on CHRY. The following day CHRY rebranded as VIBE 105, launching a new website, and a series of mainstream professional DJs[10] to fill programming time, along with pre-recorded music content. Volunteers who

[7] Whereas previously spoken word content comprised news and public affairs type programming, now Public Service Announcements (PSAs), station IDs and music introductions can also be counted towards the required 15% spoken word content.

[8] The changes approved by the CRTC were made by a regulatory body that never included the appointment of a commissioner with a background in community broadcasting (Light, 2013, Footnote 4).

[9] Some stations have even joined forces with the Canadian military to sustain their stations. For example, 105.9 Seaside FM (a self-described community based, easy listening radio station serving the Halifax Region of Nova Scotia), changed programming practices by signing a contract with the military to provide paid-military staff as on-air hosts. Press release retrieved from: https://nslegislature.ca/legislative-business/hansard- debates/assembly-61-session-4/house_12dec06#HPage5104.

[10] Though these DJs are not paid to program on VIBE 105, the majority of them are professional DJs who earn

attended the meeting received a handout explaining the changes at the station and its justifications. Upon later investigation by volunteers and concerned community members, it was concluded that though this move was deceitful and against the interests of community members and volunteers who built the station, it was perfectly legal and within the context of CHRY's bylaws (Romandel, 2015). [11]

CHRY has a long history in the Jane and Finch/Driftwood and York University communities in North Toronto, serving underrepresented Afro-Caribbean, Afro-Canadian, African and other marginalised communities in Toronto. 'Radio York' was founded as a closed-circuit radio station for York University students in 1968. In 1987, CRTC decision 87-240 allowed Radio York, under the call letters CHRY, to operate an FM licensed community radio station at 50 watts on the 105.5 dial. Since then, CHRY had flourished into a diverse medley of voices on the right of the FM dial, hosting the only station in Toronto to feature Caribbean, African, Asian and other cultures—notably the only station in the diverse city of Toronto to celebrate Caribbean accents as central to the audio aesthetic of the station (Armstrong, 2010). The centrality of Black Toronto to CHRY (and vice versa) has been noted by Charles Fairchild's seminal work on community radio in North America:

> CHRY's specificity has a lot to do with the local community, beyond which its signal is quite weak. CHRY is most closely associated with Jane-Finch...a large part of CHRY's success is the explicit focus on this one specific community, providing an obvious service for an obvious need (Fairchild, 1993, p. 181).

Furthermore, the CRTC licensing decision predicated its decision on CHRY being 'the only station in its service area that devotes considerable amounts of its music programming to black music and folk music from different parts of the world' (CRTC 1987).

Additionally, the 1994 renewal for CHRY's licence was based on a community approach to programming and the diversity of spoken word programming, as well as the use and importance of volunteers, emphasising that 'community access is one of the most important aspects of CHRY' (Mastrocola, 2016: 5). The CHRY grid prior to 1 May 2015 was a mix of music and spoken word (including news and public affairs) programming that spanned the diverse Canadian-Caribbean community, as well as Pan-African, West African, Tamil, Filipino, Jewish, Indie, Indo-Caribbean, literary, Franco-Caribbean, Hip-hop, Jazz and Gospel genres. [12] The DJs who programmed the music shows were not professionals who earned a living from DJing, but rather passionate community members who volunteered to share their love of music with the wider community.

The rebranding of CHRY to VIBE 105 had deep implications for community access and the space open to volunteers to program on the station. The handout given to volunteers at

a living from DJing. Being on the air at VIBE 105 benefits their professional prospects through free advertising of their skills and services as professional Toronto DJs. For example DJ Ritz lists on his website (http://www.djritzent.com) a calendar of paid gigs he does every week, such as a show on commercial radio station Z103 and gigs at different clubs each night of the week. Marxman the DJ programs the Soca Chutney show on VIBE 105 and also owns a DJing business (Image Events) catering to Caribbean weddings (https://twitter.com/MarxmanTheDJ).

[11] Staff at CHRY also consulted with the National Campus and Community Radio Association's Regulatory Affairs Committee to ensure its legality (https://drive.google.com/file/d/0BwDPd9fabTPHbWRuZnZkWU8yZjA/view).

[12] See the old CHRY programming grid at http://www.chry.fm/pdf/chry_program_grid_final.pdf. To this day, VIBE 105 had not released a programming grid.

the 30 April meeting stated that the rebranding is a switch to commercial practices the will be 'guided using several commercially viable practices ... and offered under a more streamlined and professional guidance of the management group.' Additionally, in a press release from the new VIBE 105, management called the programming and the campus/community radio sector in Canada mediocre, a comment that raised concern and criticism from CBC's Metro Morning host Matt Galloway, who is an alumnus of CHRY.[13] VIBE 105 management also said in the press release that they are 'making professionalism a requirement' (VIBE, 2015). Prioritising professionalism within community radio is a dramatic shift from the sector's purpose and history (CRTC, 1974; UNESCO, 2001).

This change towards a more professional sound and commercialised management approach began in 2012 when the current General Manager of VIBE 105 became Program Coordinator of CHRY. During this time, CHRY stopped live broadcasting the annual Driftwood Multicultural Festival—a celebration of diversity and community in the Driftwood/Jane and Finch neighbourhood—that CHRY was a part of since 1999 (Gopaul, 2018). The move away from community engagement was also evident in modifications to CHRY's tagline around 2013, from 'Your Community Radio Station' to 'Your Leading Source for Diversity.' The removal of 'community' from the description of the station provided for heated discussions at a Volunteer General Meeting in 2014, raising concern about the changing character of the station away from its historical community roots to a commercialised commodification of multiculturalism.[14] Regarding such changes, long-time CHRY volunteer Luca Capone observed:

> So I would say, to compare it to my earlier year as CHRY, where the staff was always very accepting, always excited about news ideas, thoughts and programming ideas that volunteers were presenting, that show hosts were presenting. But when there was a management change, especially when [a named individual] was volunteer coordinator and then became programming coordinator, there was a change towards a commercial view, focused on making us sound not original anymore, making us sound like something else, something that was maybe less concerned about quality programming, original programming, exciting risk taking programming, whether it is was spoken word or music. And towards something that would bring in advertising dollars—so there was a complete lack of respect (Capone, 2017)

CHRY's priorities had shifted over time and according to management, the new practices introduced on 30 April 2015 were meant to meet 'the expectation of current day broadcasting and media consumption' (CHRY, 2015). Rather than CHRY continuing as an alternative to mainstream Toronto media, VIBE 105 would be able to adapt to the 'changed and fast-paced media environment where opportunities on the FM dial must match the pliability of other media options' (VIBE, 2015). The move to VIBE 105, built on the dramatic elimination of community and volunteer participation in the station, was a turn towards prioritising the advancement of CHRY/VIBE within the wider commercialised Toronto FM market rather than providing a refuge or alternative from it, and appealing to mass audiences, rather than engaging marginalised or under-represented communities.

---

[13] Matt Galloway tweeted on 1 May 2015: 'Spent a long time at #chry. Nothing we did was mediocre despite meagre resources. Shame to see this happen.' https://twitter.com/mattgallowaycbc/status/594301786330046464

[14] Notes from participant observation by the author at CHRY's 30 April 2014 Volunteer General Meeting, held at Steadman Lecture Hall D, York University.

After volunteer programmers were kicked out of CHRY they immediately started organising, having recognised what they lost and seeing this as a larger trend in Toronto.[15] Their initial meeting on 12 May 2015, garnered support from a large number of former volunteers, staff and board members from the over 25-year history of CHRY on the FM dial, and also community members who were concerned with what had happened. It was through this process that volunteers and community members learned what was written in the by-laws, and the lack of power they held within the governance structure of the station. As part of its governance structure, CHRY hosted a semi-annual Volunteer General Meeting (VGM), such as the one where volunteers were dismissed on 30 April 2015. However, this VGM was not the Corporation Act of Ontario mandated Annual General Meeting (AGM), though this distinction was never raised or explained to community volunteers who produced the majority of programming at the station. The CHRY by-laws (2012) state that only students at York University were voting members of the corporation and had legal powers to demand accountability and change. Though concerned York students did attend the initial organising meeting on 12 May, some of whom were also volunteers at the station, not enough interest was garnered from them to take legal action as the only legal members of the corporation. Without action from York students, non-student volunteers (i.e. community volunteers) were not able to influence accountable and transparent governance at CHRY.

The CHRY board of directors never, in a lapse of accountability and governance literacy, ensured that volunteer programmers from the community were part of the governing structure of the station itself. The idea that 'A community organization board considers itself based in and representative of a community' is among best practices identified in the literature (Bobo, Kendall & Max, 2001: 182). It is also worth noting, the relevant legal statutes do not require non-profit organisations, like CHRY and other community radio stations, to be representative of the community.[16] In fact, the Canada Not-for-profit Corporations Act (S.C. 2009, c. 23), states: 'Unless the by-laws otherwise provide, a director of a corporation is not required to be a member of the corporation' (see Membership 126-2). A former CHRY board member[17] Paula Davis, explained her experiences on the CHRY board:

> What the board sees is ad revenue, what the board doesn't see is: what is the value volunteers are bringing, what is the value of the programming that we are doing? It is this intangible thing that is driving the organization but we never talk about it, there's never a conversation. And this is the problem, the board doesn't deal with vision, the board doesn't actually defend [community] radio as a medium, it defends this entity that is the station and it has no way of reconciling the sacrifice of volunteers, the value of volunteers (Davis, 2016).

Volunteers that were kicked out of CHRY continued to search for forums to express their grievances outside of the legal avenues closed to them[18] by organising community meetings

[15] In 2011 the CRTC revoked the licence for CKLN, a community radio station that had operated out of Ryerson University as the 'voice of the underground' since 1983. The revocation came after four years of internal struggles over governance, finances, and the mandate of the community radio station.

[16] Also see COCo's Health House Tool: https://coco-net.org/healthy-house-nonprofit/

[17] All members of the CHRY board of directors are volunteers elected from programmers, community members, and York University staff. CHRY staff are non-voting members of the board (CHRY By-laws, 2012).

[18] Some took their complaints to the CRTC, filing complaints with the body about the changes at CHRY. But all received the same response: 'Although the CRTC regulates and supervises the Canadian broadcast system under the Broadcasting Act (the Act), the broadcasters themselves are responsible for the choice, content,

at York University and the Jane and Finch Community Centre,[19] participating in conferences such as the conference hosted by the Media Action Research Group (MARG),[20] and taking to the airwaves with sympathising stations and shows such as CKUT, CJMP and GroundWire Community Radio News. A handful of volunteers took their shows and energy to the newly AM licensed community radio station CJRU operating out of Ryerson University where they continue to advocate for accountability from VIBE/CHRY.[21] At the aforementioned MARG conference, volunteers kicked out of CHRY and their supporters summarised the arbitrary transition from CHRY to VIBE 105 as taking the community out of their community radio station to promote a commercialised agenda and sell CHRY, a community built space, as VIBE 105 or a more sustainable 'brand' for attracting audiences on Toronto's FM dial. The lack of transparency by staff at CHRY, combined with an absence of governance literacy within volunteer engagement practices at the station, were seen as the main reasons community volunteers were easily disenfranchised from decision-making that approved cancelling all CHRY programming and rebranding as VIBE 105.[22] A similar trend of commercialising community radio practices was seen only one year later disrupting volunteer access at Radio Centre-Ville in Montréal.

Case Study of Radio Centre-Ville

For more than forty years, Radio Centre-Ville has served the needs and interests of Montréal's diverse linguistic communities. On air since 1974, the station is Québec and Canada's oldest multilingual community radio broadcaster with licence conditions to broadcast in French, English, Spanish, Chinese, Haitian Creole, Portuguese and Greek. Among the community members who founded the station and continue to program on-air are immigrants and political refugees, some from Argentina, Chile, Mexico, and Haiti, who shaped the 'critical leftist' positioning of the station's programming (Gonzalez Castillo, 2014). Community radio in Québec is uniquely supported with operational funds provided by a program under the provincial government's Ministry of Culture and Communication (Light, 2013). There is a direct link between public policies that support development of community radio and the sector's roots in Québec's nationalist movement (Gonzalez Castillo, 2014). Eduardo Gon-

and scheduling of the programming they provide. The Act does not give the CRTC the right to edit or censor programming.' (email sent to Elleni Zeleke from CRTC DONOTRESPOND/NEPASREPONDRE crtcdonotrespond@crtc.gc.ca, June 16, 2015).

[19] Public meetings were held on 12 May, 27 May, 10 June, 6 July and 16 September by an ad-hoc group of kicked out volunteers, past staff and board members, and concerned community members under the banner "SaveCHRY" (https://www.change.org/p/chry-radio-inc-save-chry-immediately-set-aside-the-april-30-2015-dismissal-of-programmers-reinstate-all-shows-and-volunteer-programmers-as-of-april-29th-2015-call-a-general-members-meeting-agm-within-the-required-mandate-to-address-these-concerns).

[20] http://www.mediaactionresearch.org/wp-content/uploads/2016/05/MARC-schedule-1.pdf.

[21] On 24 and 25 March 2018, the NCRA held a Station Manager Summit hosted by VIBE 105 at York University. Randy Reid, former Program Coordinator of CHRY and current General Manager of VIBE 105 presented a session entitled 'VIBE105 Transition—From CHRY to VIBE105.' Volunteer programmers kicked out of CHRY in 2015 and who are current volunteers at CJRU (Ryerson University) wrote a letter to the NCRA objecting to Reid's presentation without representation from volunteers who were dismissed in the process he was describing (https://docs.google.com/forms/d/e/1FAIpQLSdGV3HkBwqGZFv3RQCJ- 1z71-5_Ynvqs1ufl7WBbE4hp-PBoFA/viewform campus-and-community-broadcast/).

[22] The ad-hoc group SaveCHRY presented a workshop entitled "Take Back Our Space: Mapping Community Media in Toronto" on 13 May 2016 at the MARG conference.

zalez Castillo observes 'where francophone community radio was seen as an instrument for reinforcing nationalist pride' the multicultural and political agenda of Radio Centre-Ville's programming makes the station a historical anomaly in the development of community radio in Québec (2014: 589).

Individuals from diverse community and ethnic groups in the St-Louis neighbourhood came together in the early 1970s to form a not-for-profit organisation and apply for a FM radio licence. After years of organising and early broadcasts conducted from the studios of Radio McGill (CKUT 90.3 FM), Radio Centre-Ville was granted a licence by CRTC decision 74-388 to broadcast in five languages in 1974. On 30 January 1978, the membership of Radio Centre-Ville passed a Declaration of Principles that ensures the station provides 'priority access to the airwaves' for low-income and disadvantaged individuals or groups and airs independent radio programming that promotes active citizenship and the 'equitable distribution of airtime' (Radio Centre-Ville, n.d.). Initially sustaining financial instability and infrastructure challenges (including limited studio space and transmitter failure due to a storm), Radio Centre-Ville moved into a new building in 1982. Over the years, Radio Centre-Ville has won awards for promoting citizenship and multicultural exchange and set many precedents on the radio dial, including launching programs by and for feminists, LGBTQ people, prisoners, children and refugees (Radio Centre-Ville, n.d.).

Governance of the station, including compliance with the CRTC, is facilitated by a mix of paid staff and volunteers elected to the board of directors by the station's registered membership during the Annual General Meeting.[23] Radio Centre-Ville's programming is coordinated by a committee made-up of representatives from the different linguistic teams of volunteer producers. In recent years, the station has suffered from financial instability that resulted in a growing deficit. The press coverage of Radio Centre-Ville's financial troubles highlighted the station's efforts to launch a cafe (in the same building as the radio station) to cultivate new revenue sources (Faguy, 2017). Yet, the financial crisis worsened and heightened governance problems at Radio Centre-Ville. Discord between the board and the linguistic teams developed in part due to decisions taken to privatise some station practices, effectively running the station as a private business through heavy handed bureaucratic practices (Gonzalez Castillo, 2014). For some producers, these changes 'ran contrary to the principles the radio station had defended throughout its history' (Gonzalez Castillo, 2014). The issue of commercialising practices came before the membership on 4 December 2016, in a general assembly. On that day, Radio Centre-Ville's membership took decisions, electing a board and passing one resolution prohibiting the selling of airtime, that has yet to be implemented by the station's board and staff (GroundWire, 2017). Dozens of volunteers have since been kicked off air or had their shows moved to accommodate programmers who purchase airtime.

Barred programmer Frantz Andre shared his experiences of recent changes at the station. Andre described his last show at Radio Centre-Ville: 'one night we came in and the doors were locked and we were told we cannot have our program.' He noted the lack of community access to the airwaves and decision-making is not what he expected from a community radio station. He added:

[23] According to the Not-for-profit Corporations Act of Canada (S.C. 2009, c. 23) and Companies Act of Québec (C-38), the organization's membership elects a board of directors to be the legal representatives of the non-profit radio station.

> Radio Centre-Ville is a station that has been around for more than 40 years and our program has been on air for 30 years. This is a democracy in Montréal and most of the volunteers at Radio Centre-Ville are people who suffered dictatorships in their countries. So they are coming here, knowing that there is a democracy and freedom of speech, with Radio Centre-Ville giving that opportunity. And suddenly not having that freedom of speech because some people have decided that they are only going to act in their own interests. That is not acceptable (GroundWire, 2017).

Andre and other displaced volunteer programmers organized a press conference on 1 February 2017, in response to the 'tyranny at Radio Centre-Ville.' In a public statement, the volunteers behind the press conference identified the 'height of the crisis' as the general assembly following the December meeting and vote held on 22 January. They reported the January meeting 'was marked with irregularities and in which several dozens of unknown persons arrived and acted like legitimate members' (Radio Centre-Ville en lutte, 2017). During the press conference, concerned programmers condemned the anti-democratic practices forcing the commercialisation of the station's programming and management practices. Mikhail Kapellas, a member of Radio Centre-Ville since the 1970s addressed the press conference. Kapellas quoted from the website of the ARC-Québec and pointed to the mandate of community radio 'to reinforce the participation of citizens in public affairs.' Kapellas concluded, 'when you start selling whole hours of programming, then you destroy the nature of community radio. Because you do not allow dozens of citizens and volunteers to participate in the radio station' (GroundWire, 2017). Some of the station members who participated in the press conference also reported that they had contacted the CRTC for assistance and were told that the regulator cannot be involved in the internal matters of the radio station (GroundWire, 2017).

Because of the CRTC's in-action, on 13 March 2017, the board members elected at the 4 December general assembly filed a complaint at the Superior Court of Québec, seeking the annulment of the 22 January general meeting and the right to appeal the station board's decision to introduce programming changes under which 'airtime was illegally sold' (Moreno vs Lalanne Zéphyr, 2017). Elected by the membership to the board at the December meeting, Aristofanis Soulikias, believes the station's new governance practices and programming changes have departed from the mandate of community radio. Soulikias observed:

> Community radio, like all real community organizations, are formed from the bottom to the top. It is not a top bottom, top down system. Here we have a situation where all kinds of changes are taking place. Shows are being sold for money to private entities that come, take over a radio show that has been rooted in the radio landscape of Montréal community for decades with security guards. This is imposed physically. We are talking about, you know, security guards blocking the way of volunteers trying to enter the studio. People were trying to do their show and not even being informed that their show is no longer. So definitely that is really far from anything that I can call community radio (Soulikias, 2017).

Long-time programmers like Kapellas agree that there is a democratic deficit at Radio Centre-Ville. For Kapellas the conflict at Radio Centre-Ville is contributing to a larger crisis in media, stating that:

> If you lose the community radios, then you will have the alternate facts, fake news, and *radio-poubelle* [trash talk radio in Québec]. So that is the question, do we want a society that has more participation of citizens or not? A community radio station can contribute to citizen engagement (GroundWire, 2017).

Since the launch of the complaint at the Superior Court of Québec, the board elected in December has won the release of documents, including membership lists, general assembly attendance records and board meeting minutes (Moreno vs Lalanne Zéphyr, 2017).

For programmers displaced from Radio Centre-Ville, a committee of former station volunteers is organising to reinstate democratic governance and community access to airwaves.[24] For now Soulikias is still on-air presenting the only program on the FM dial that reports on Montréal news and cultural information in Greek. According to Soulikias:

> Radio Centre-Ville was an island or an oasis in a commercial radio landscape. There are a few other Greek-language shows, heavily commercialised and dependent on the church [funds]. We were independent and that one island has now been taken over in large chunks, transforming Radio Centre-Ville into a commercial radio (Soulikias, 2017).

Other programmers agree that the paid content now on air at Radio Centre-Ville sounds commercial. Former volunteers like Andre also believe many of the new programs are transforming the critical political perspective of Radio Centre-Ville. Andre compares his banned program that was critical of the occupation by the United Nations (supported by Canada) in Haiti to the mainstream coverage now on air at Radio Centre-Ville that promotes the status quo (Andre, 2017). Today, according to volunteers kicked off air like Andre, volunteers still on-air like Soulikias, and longtime volunteers like Kapellas, Radio Centre-Ville is, for the first time, airing paid content that does not match the station's critical leftist origins or community radio's mandate. Forty-two years after the station's founding by and for community members, Radio Centre-Ville's governance and programming is being redefined by for-profit, commercial and status quo practices that are no different than commercial radio practices.

Conclusion

On 29 March 2017, CKUT Radio 90.3 FM (Radio Centre-Ville's partner community radio station) in Montréal made a public statement concerning the financial crisis impacting the community radio sector. The statement (CKUT, 2017), released online and read aloud at a public demonstration held outside of Radio Centre-Ville, points to austerity measures that have produced drastic cuts in public funding, privatisation, and threaten the sustainability of community radio. CKUT warns that from Toronto to Montréal, 'community radio stations are ever more susceptible to becoming commercial and violate their mandates to provide community-oriented programming' (CKUT, 2017). These changes are not just affecting Radio Centre-Ville and CHRY, CKUT also points to stations like CIBL (Montréal's oldest francophone community radio station) that cancelled all of its on-air shows in September 2016 to change programming formats and thereby attract more advertisers.[25] A similar trend can also be seen more recently at CIUT in Toronto, where a longtime Indigenous programmer

[24] This includes organising a 'Gathering to Denounce the commercialization of Radio Centre-Ville' on 29 March 2017, and a fund raiser to support the legal case called 'Célébrons ensemble la résistance! Pour une Radio libre' 30 July 2017.

[25] In December 2017, the former station director who instituted commercial radio practices at CIBL resigned. In January 2018, the board of directors of CIBL fired all staff and closed the station due to an ongoing financial crisis. The board, with the support of community members and former staff, are now working to relaunch the station in May 2018: http://montrealgazette.com/news/local-news/montreal-community-radio-station-cibl-fm-lays-off-all-its-employees.

was suspended from the station after criticising on-air the mainstream media's coverage of the death of Colten Boushie, a young Indigenous man in Saskatchewan, and the acquittal of his killer, Gerald Stanley (Kao, 2018). Such practices silence dissenting voices within a sector founded to amplify radio made by and for diverse communities marginalised and underrepresented in public and private media.

The above case studies of CHRY and Radio Centre-Ville explore contemporary contradictions in community radio practices by investigating changing regulatory policies and station practices. This research begins to address gaps in existing scholarship, such as Daniela Mastrocola's (2016) research paper about the transition of CHRY. While Mastrocola identifies insufficient resources (despite station surpluses) as the cause of the drastic changes at CHRY, the paper gravely overlooks the policy context in Canada and did not consider the impact of the commercialisation of community radio from the perspective of volunteers who are directly impacted by these changes. Guided by community radio, anti-oppression and third-sector studies literature, this study prioritises the views of volunteers as necessary to evaluate the impact of the commercialisation of community radio. These case studies help to illuminate the role of paid staff and governing boards in instrumentalising policy gaps to impose change. Additionally, this research is placed within a broader historical context that views the development of commercialising community radio practices and policies over time. Finally, this research has also identified the need for future studies to consider the professionalisation and commercialisation of community radio within the broader context of the neoliberalisation of media.

This comparative view of commercialising governance and engagement practices within two community radio stations in major markets in Canada seeks not only to document the discord experienced by community radio volunteers, but also learn from these challenges and inform community radio policies and station practices that provide sustainable mechanisms for community participation and accountable governance. Where the corruption of power and privilege is harmful to the sustainability of any community radio station (Hancock & Khan, 2004), this research recognises that opportunities are not always evident for volunteers participating in community radio stations. Kira Page from the Montreal-based Centre for Community Organizations (COCo), points to limitations in the legal frameworks in Canada for not-for-profit organisations experiencing conflict. Kira observes:

> There isn't really a mechanism for enforcing [bylaws] outside of the power that we have between ourselves within organisations. So the enforcement mechanism that is given is really the membership at the annual general meetings. There is no ombudsperson. You can't call 911 on a board of director's meeting gone badly wrong... Nonprofits are meant to be self-managed. And so when we have problem with each other, we have to fix them with each other. And that can be extremely challenging, but it can also be way more rewarding for the end for the organisation to find new and creative ways to solve conflict within itself (Page, 2017).

Page's insights reveal that in the absence of appropriate mechanisms that empower community members within non-profit community radio stations, it is necessary to build on experiences of volunteers displaced from CHRY and Radio-Centre-Ville and develop best practices concerning governance and engagement practices.

According to Kristiana Clemens, co-founder and vice-president of the Community Media Advocacy Centre, improving governance practices within community radio stations is

necessary given changing practices across Canada (CMAC, 2018). Clemens (2017) believes volunteers should be aware of policies and procedures, because 'community radio stations are comprised of the people within them and in order to accomplish their goals, those individuals need to find ways to work together and the way that happens is through documentation for governance, policy, and procedures'. Based on over two decades of experience working in community radio stations across Canada, Clemens concludes:

1. Where nonprofit community radio stations are sustained by community dollars and volunteer labour, procedural and fiscal transparency should be established by posting bylaws, policies, and financial statements (on the station website and within the station) for review by station members and the community at large;
2. Community radio stations need to encourage and publicise volunteer participation in board meetings and require member consultation on major governance changes, rather than relying solely on the annual general meeting;
3. Stations should create a policy committee that is representative of non-management staff and volunteers to ensure that all stakeholder voices can be heard in the policy development process;
4. And to ensure more accountable governance structures, community radio stations should implement anti-oppression orientations for new volunteers as well as directors of the board and staff. (Clemens, 2017)

Similarly, the COCo has developed non-profit organisational assessment tools [26] and anti-oppression audits to help organisations, like community radio stations, 'identify priority areas and work towards fostering a culture where people are willing to change' (Page, 2017). Tools and best practices are needed because the current CRTC policy mandates community radio to distinguish itself 'by virtue of its place in the communities served' (CRTC 2010-499). However, the experiences of CHRY and Radio Centre-Ville volunteers reveal that commercialising community radio policies and practices is reducing the engagement and empowerment of volunteers in community radio programming and governance. Given the community radio volunteer experiences of governance deficiencies and changing station practices documented through this comparative case study analysis, better practices are needed to re-centre community radio within the community and to sustain non-profit broadcasting practices in Canada.

CHAPTER 18

Podcasting About Yourself and Challenging Norms: An Investigation of Independent Women Podcasters in Denmark

Freja Sørine Adler Berg

Nordicom Review 43, no. 1 (2022): 94–110. https://doi.org/10.2478/nor-2022-0006.

Abstract

This article investigates why and how women use independent podcasting and social media platforms to challenge norms afflicting their own personal lives. Extending previous studies of independent podcasting as a tool of empowerment, this article analyses semi-structured interviews with the hosts of two podcasts: the mental health and personal journals podcast *A Seat at The Table* and the parenting podcast *Our Different Family* [*Vores Anderledes Familie*]. The podcasts are norm-challenging but, at the same time, illustrative of a gendered podcasting sphere in which women primarily podcast about what has traditionally been considered female domains, such as mental health, personal journals, and parenting. The study finds that podcasting's lack of visuals and unrestricted, conversational format allow for creating and distributing in-depth realisations about personal norm-challenging issues. Simultaneously, it finds that the participatory affordances of social media platforms are essential for receiving feedback, content ideas, and emotional support from like-minded listeners when the podcasters challenge oppressive norms.

Keywords

independent podcasters, women's voices, podcast production, oral-aural media, listener communities, social media

Introduction

Independent podcasting provides a channel for all kinds of voices to express themselves about personal subject matters. In contrast to institutional radio and podcasts, independent podcasters represent themselves and do not undergo any kind of editorial gatekeeping (Adler Berg, 2021a; Markman, 2012; Millette, 2011). This freedom allows for breaking down traditional boundaries regarding what can be said and done in the media. While also engaging specific subcultures through their frequent online interactions with listeners, independent podcasters share characteristics with bloggers, YouTubers, and other types of user-generated content producers (Markman, 2012). Their participatory characteristics lead to offering and receiving support on diverse issues such as disabilities and illnesses (Collins, 2018; Meserko, 2014; Pruulmann-Vengerfeldt & Buchholtz, 2018), ethnic minorities (Vrikki & Malik, 2019), Blackness (Florini, 2017; Fox et al., 2020), and queer identities (Copeland, 2018; Fox, 2008; Zehelein, 2019).

A fast-growing research area within podcast studies focuses on independent podcasting's capabilities for women. As recording technologies have become more affordable and accessible in recent years, women see opportunities to podcast while doing household work (Wang, 2021). The freedom and intimacy of the medium provide women with narrative power (Greer, 2017) and allow podcasters to challenge norms of gender and sexuality (Adler Berg, 2021b; Copeland, 2018) and discrimination, social stigma, and prejudices against women (Jorgensen, 2021; Zehelein, 2019). Because of its ability to challenge norms—suppressive and uncomfortable as they are for those who cannot inhabit them (Ahmed, 2014)—independent podcasting constitutes a relevant feminist research object.

Yet, these previous studies (Copeland, 2018; Greer, 2017; Jorgensen, 2021; Wang, 2021; Zehelein, 2019) all present textual and auditory analyses. Research on independent podcasting's possibilities for women requires further quantitative documentation and qualitative investigations from the podcasters' points of view, and I intend to address the research gap with this article by combining a preliminary quantitative analysis with semi- structured interviews with podcasters. Furthermore, I specifically explore independent women podcasters in Denmark, which is a relevant and complex country-case, for two reasons. First, in comparison with the growing body of academic research on independent podcasts in larger geolinguistic regions such as the US and UK (e.g., Llinares et al., 2018; Spinelli & Dann, 2019), we know very little about independent podcasting in smaller regions. Denmark, with its 5.7 million citizens, provides an opportunity to study this phenomenon. Second, the number of women and men in Denmark listening to podcasts is equal (DR, 2022). Yet, as the preliminary quantitative analysis shows, more men than women are podcasting, and very different topics are discussed and disseminated in podcasts, depending on the podcaster's gender. Men tend to podcast about sports, comedy, film, television, and business; women tend to podcast about mental health, personal journals, and parenting. Quantitatively, independent women

podcasters engage in what has traditionally been considered female domains (henceforth, traditional female domains), even though they, at a qualitative level, counter institutional media representations and challenge gendered norms (Adler Berg, 2021b; Copeland, 2018; Fox, 2008; Greer, 2017; Jorgensen, 2021; Wang, 2021; Zehelein, 2019).

Hence, this article investigates the relations between engaging in traditional female topics and challenging norms. I ask the following question: Why and how do women use independent podcasting and social media platforms to talk about mental health, personal journals, and parenting while at the same time challenging norms? I consider two sub-themes: 1) the possibilities of independent podcasting for women, including challenging how to speak and what to speak about, and 2) the possibilities of online communities, including receiving emotional and creative support.

To answer these questions, I examine two podcast cases which are both norm-challenging and engaging in traditional female topics: the mental health and personal journals podcast *A Seat at The Table* and the parenting podcast Our Different Family [*Vores Anderledes Familie*].

Before embarking on methods and analysis, I present key conceptions of independent podcasting as an oral-aural medium and its potentials and limitations for women, in order to provide a theoretical framework for understanding the podcast cases.

Independent podcasting as an oral-aural multisocial medium

We are all affected and formed by the experience of hearing a person's voice dominating, talking over, interrupting, or criticising another person's voice. Consequently, while much has been written about the space privileged bodies take up in visual media and the effects of these physical bodies, we must also consider which voices take up space in the media, what they say, and how they say it. Voice in this regard should be thought of with a dual understanding, conceptualised as what to speak—speech as linguistic production of meaning, or the semantic level—and how to speak—speech as vocal expressions, or the performative level, which includes tone, identity, and emotional register (Lawaetz, 2014).

The voice as the central means of communication in podcasting is inherently intimate, affective, and powerful. It is indeed expressive (Arnheim, 1936/2008), as it reveals basic emotions of fear, passion, happiness, anger, and sadness, which makes the listener realise that the stories the voices tell are actual lived experiences (McHugh, 2012). Podcasting as an oral-aural medium with no visuals to rely upon gives podcasters a space for expressing themselves without worrying about their appearances. Furthermore, the lack of visuals creates empathy as listeners use their imagination to "see" the events unfold (Rodero, 2012). Thus, podcasts, like radio and music, are effective tools of resilience and mobilisation. As radio scholar Kate Lacey (2013: 8) has pointed out, the act of listening to voices involves "*both* the realm of sensory, embodied experience and the political realm of debate and deliberation [emphasis original]".

Then what differentiates independent podcasting from institutional podcasting or radio? While large-scale institutionalised formats must reach mass audiences in order to maintain funding and broadcast permission, the lack of editorial gatekeeping in independent podcasting provides people with the freedom to talk about what they want, for as long as they want, how they want, and to whom they want. This authenticity of what is being said and how it is being said has become an aspirational ideal for independent podcasters (e.g., Adler Berg,

2021b; Collins, 2018; Jorgensen, 2021; Meserko, 2014, 2015; Mottram, 2016; Sullivan, 2018) and enables further empathy and identification with the persons talking and being described in the podcasts (e.g., Collins, 2018; Copeland, 2018; Greer, 2017). Independent podcasters reach out "to the world of the similarly minded" (Zehelein, 2019: 145), and they often engage in deeply personal (even private) stories about their own life or the lives of their guests (Adler Berg, 2021a; Collins, 2018; Jorgensen, 2021).

This, in turn, affects listeners, who then deeply engage with the podcasters and their content (Schlütz & Hedder, 2021). Interacting, sharing, and discussing podcasts online are significant motivations for listening to independent podcasts (e.g., Fox et al., 2020; McClung & Johnson, 2010; Perks & Turner, 2018) and consequently, independent podcasters have more online interactions with their listeners than traditional media content producers (Berry, 2016; Löwgren & Reimer, 2013; Markman, 2012; Markman & Sawyer, 2014). In this sense, independent podcasting is not solely a radiogenic medium characterised by parasocial relations between podcasters and listeners, but indeed is also a multisocial cross-media ecosystem (Swiatek, 2018). Through social media platforms, listeners communicate and collaborate about shared interests and challenge norms and societal structures.

In sum, the accessibility, freedom, and authenticity of independent podcasting and its multisocial dimensions are, as Kim Fox, David O. Dowling, and Kyle Miller (2020: 302) find, "well suited to the project of community building".

Potentials and limitations for independent women podcasters

Traditional Western radio journalism teaches reporters and hosts to speak without emotion, using the lower range of the voice (Mottram, 2016). Because male (or naturally low-pitched) voices are still associated with authority and credibility, and female (or naturally high-pitched) voices are associated with the domestic sphere (Mottram, 2016), at least in Western countries, women in radio have historically defied their physiology and developed deeper, neutral voices (Mills, 2004). In a Danish context, the Danish Broadcasting Cooperation has, as shown by voice researcher Anna Lawaetz (2014), trained women radio presenters to speak with a narrow frequency and to use certain intonation patterns, while men have been given greater freedom to raise and lower their voices. In another study, Lawaetz (2019) analysed the voices of three high-profile Danish politicians and concluded that their voice pitches dropped concurrently with increasing their political power. And this tendency applies to women in general, as women's voice pitch on average has dropped by 23 hertz over five decades (Pemberton et al., 1998).

Independent podcasting, characterised by its lack of editorial gatekeeping, becomes a space for rebelling against prevailing linguistic and vocal norms. It permits women to talk about women to other women (Adler Berg, 2021b; Greer, 2017) and to "hear how women really talk and think" (Wang, 2021: 64). Podcast scholar Stacey Copeland (2018: 214) has pointed out that "podcasting and digital soundwork offer a new platform for female voice, including those not traditionally 'warm' or 'low' enough for radio", which resonates with Christine Mottram's (2016: 66) conclusion: "Finding vocal authority in podcasts is not about achieving the traditional Western aesthetic of the low, deep voice, but about sounding like a 'real' person: individually authentic". This way, independent podcasters can change the ideal for

women's voices. If more listeners are exposed to high voices, then they have the possibility of achieving the same status as low voices.

For contextualising and conceptualising independent women podcasters, we see that at least three categories of voices in radio and podcasting exist: 1) the male voice, which uses a wide set of vocal opportunities, 2) the institutional female voice, which has a narrower set of vocal opportunities at its disposal, and 3) the non-institutional (or independent), unrestricted female voice.

Having already discussed the potentials of independent podcasting for women, certain limitations should also be considered. First, limitations concern the increasingly powerful platforms—for example, Apple and Spotify—which independent podcasters must use in order to be found and listened to. A voice not listened to is not recognised as legitimate, according to Kate Lacey (2013: 166): "Without a listener, speech is nothing but noise in the ether". But platforms have the power to censor or remove podcast episodes, including norm-challenging podcasts which may be considered controversial or inappropriate. Today's platforms, more commonly, complicate the ability to remain visible to existing listeners and be discovered by new listeners (e.g., Berry, 2016; Sullivan, 2018; Swiatek, 2018) and thus hinder community building. As Wang (2021: 66) argues, the commercialisation of podcasting, in which "more professional programs" are increasingly favoured by platforms, will further marginalise women's unpaid podcast production work. Discoverability issues may force independent podcasters to spend more time on optimising their content for the infrastructures of platforms and less time on creating their podcasts (Morris, 2021: 18).

Second, limitations may concern listeners' and podcasters' expectations of what makes a "good" or "successful" podcast, for example, the opinion that personal subject matters need to be revealed (Collins, 2018), or, as the preliminary quantitative analysis outlined below indicates, that certain topics are suitable for either women and men to podcast about. Normative imperatives for women podcasters also include traditional discourses around women's voices. A pervasive critique in the media of the popular Danish independent true crime podcast Dark Country (Aurvig & Bugbee, 2018–present) seems illustrative. Despite their many listeners—or because of their mainstream breakthrough—the hosts were publicly criticised for being incompetent, ignorant, and immature, not solely because of their professions as journalists and not detectives, but also because of their high-pitched voices, informal conversational tone, lisps, and vocal fry (the use of the lowest tone of voice characterised by its creaky, breathy sound), which were perceived as inappropriate for discussing murder cases (Nielsen, 2019).

Consequently, as these political, economic, and sociocultural structures are impinging upon their possibilities for expressing themselves and building communities, independent women podcasters may become increasingly institutionalised and suppressed.

Setting the Danish terrain: Preliminary quantitative analysis

In May–June 2020, I sampled 552 independent Danish podcasts and coded these by their formats and topics (for sampling and coding procedure, see Adler Berg, 2021a). One year later, in June 2021, I made use of this previous mapping (Adler Berg, 2021a) to investigate the genders of the podcasters, which I determined by listening to the podcasts and considering

the gender pronouns the podcasters used about themselves on their social media accounts. I then divided the genders of the podcasters by the most widespread topics of the podcasts.

Questionnaire surveys conducted almost a decade ago revealed that 90 per cent of English-speaking independent podcasters worldwide, but mostly located in North America, were men producing content for a male audience (Markman, 2012; Markman & Sawyer, 2014). The Danish independent podcasting sphere is, in comparison, considerably more gender-balanced. Still, while women's and men's podcast consumption is equal (DR, 2022), more men than women are producing independent podcasts. The preliminary quantitative analysis revealed that 33 per cent of independent podcasts are produced and hosted by women (20% by one woman, 13% by more than one), 57 per cent by men (27% by one man, 30% by more than one), and the remaining 10 per cent by men and women together. The fact that only 10 per cent of the independent podcasts are hosted jointly by both genders may indicate difficulties in finding common interests to podcast about: While men podcast about external topics such as sports, film, television, and business, women are urged to podcast about themselves and their personal inner lives. As much as 37 per cent of all women podcasters podcast about mental health and personal journals, and the second most widespread topic for women, at 11 per cent, is parenting (see Adler Berg, 2021a).

Consequently, while women bloggers, YouTubers, Instagrammers, and independent podcasters have the ability to counter institutional media representations, women still engage in traditional female domains pervaded with emotionality (Ahmed, 2014). A likely explanation might be that they are formed by societal norms to talk about these topics. Reproducing traditional media's preoccupation with traditional female and traditional male topics makes them no different from, for example, broadcast television, in which programmes about family, relationships, and well-being are hosted by women and sports programmes are hosted by men (Andreassen, 2015).

Case studies: A Seat at The Table and Our Different Family

I selected two podcast cases to investigate why and how women use independent podcasting and their online communities when striving to challenge norms. Two cases seem appropriate for elucidating several aspects of the quantitative findings while still retaining sufficient space in this one article for case studies. The first case selected is *A Seat at The Table* (*ASATT*), made by Ingrid Baraka and Naima Yasin who, based on their own and guests' lived experiences, discuss issues in relation to "being Black women in Denmark" (Baraka & Yasin, 2017a–present); thus, its topic is coded as "mental health and personal journals". The topic of the second podcast case, *Our Different Family* (*ODF*), is coded as "parenting". *ODF* is made by Sophie Nielsen, who interviews guests about trying to thrive as a parent in LGBTQ+ family constellations, families struggling with diagnoses, disabilities, illnesses, and so on.

The two podcast cases are purposive (Neergaard, 2010) for five reasons: 1) they are representative of the topics that women podcast about; 2) they have high cultural impact (in terms of social media followers' numbers, *ASATT* and *ODF* have 8,020 and 6,553 followers on Instagram, respectively) (Baraka & Yasin, 2017b–present; Nielsen, 2020b–present); 3) one podcast is led by two women and the other by one woman (to investigate the importance of podcasting as an individual or collaborative practice); 4) the podcasters were unknown to

the Danish public before starting their podcasts (to reflect on the theoretical description of independent podcasting as a democratic medium with no editorial gatekeeping); and 5) they explicitly and publicly communicate that they are norm-challenging. Echoing *ASATT*'s title, the podcast's description along with several episode intros state that the podcast intends to offer "more people a seat at the table" (Baraka & Yasin, 2017a), thus giving voice to people that Baraka and Yasin find are not represented in institutional media. Likewise, *ODF*'s description and several of its episode intros announce that the podcast scrutinises what it means to be "different from most families" (Nielsen, 2020a–present). Both podcasts speak *from* and *to* minority positions, regardless of their high numbers of listeners and followers.

Source: Baraka & Yasin, 2017a–present; Nielsen, 2020a–present

Previous studies have conducted auditory and textual analyses of independent women podcasts (Copeland, 2018; Greer, 2017; Wang, 2021; Zehelein, 2019). Yet, for the purpose of understanding motivations, experiences, decisions, and emotions, semi-structured interviews are useful (Brinkmann & Kvale, 2009; Lindlof & Taylor, 2011). Thus, I invited the podcasters via e-mail, and semi-structured interviews were carried out 12 April (Baraka and Yasin) and 13 April (Nielsen) 2021 (via Zoom due to the Covid-19 pandemic). The recorded interviews lasted for 47 minutes and 65 minutes, respectively, and were based on the following questions: Why do you podcast? Which possibilities does independence offer you? Why do you podcast about the topics that you podcast about? How and why do you form online relationships with listeners? After transcribing the recorded interviews, I inductively categorised and, finally, analysed them, informed by a close listening to approximately ten episodes of each podcast (Baraka & Yasin, 2017a–present; Nielsen, 2020a–present). All interview quotes were translated from Danish to English by me.

In the following analysis, I discuss the possibilities (and the limitations) of independent podcasting in relation to why Nielsen, Baraka, and Yasin—as is the case for most independent women podcasters—podcast about mental health, personal journals, and parenting. In the second part of the section, I turn towards how they experience the significance of social media activity in relation to their podcasting practice. The analysis is structured according to the research sub-themes (the possibilities of independent podcasting, including challeng-

ing how to speak and what to speak, and the possibilities of online communities, including receiving emotional and creative support).

The possibilities of independent podcasting: Realising and reflecting about yourself through podcasting

The *ASATT* project was initially planned to be a magazine, but rather accidently transformed into a podcast. To generate ideas for the magazine without having to make detailed notes, Baraka and Yasin (along with two former podcast members) recorded a conversation amongst themselves, with little interest in sharing it with others. But as they listened to the recording afterwards, they saw the potential of making it public. *ASATT*'s origin story indicates that conversations constitute the foundation of the podcast. Four women decided to record their conversation which then became the first episode of the podcast, as Baraka explained: "*ASATT* and the podcast medium have grown symbiotically together, and I think this is our strength: that we have become native to the podcast".

Yasin and Baraka appreciate podcasting's audio-only format because, Yasin argued, audio-visual media distract audiences' attention: "Wearing a scarf, a face mask or whatever means that what you say is not listened to". Though they post pictures and videos of themselves and podcast guests on social media, podcasting liberates them from being judged by or worrying about their appearances while podcasting. Likewise, Nielsen finds podcasting more adequate for "creating dialogue" in a "natural way" than blogging or YouTubing, which she initially also considered relevant for her project. Nielsen aims to facilitate an unmediated, informal conversation in her podcast:

> I decided to podcast because I wanted to hear other people's stories. But it should be like if I had invited the guest home for a cup of coffee. The conversation has to be without limitations, letting itself unfold [between me and my] guest.

Independent podcasting's oral-aural vernacular and (fairly) unedited and unscripted nature allows for addressing a wide variety of topics and to let personal, humorous, serious stories, and laughs, affections, cries, frustrations, and anger succeed one another. This conveys a sense of intimacy and authenticity as well as trust (Jorgensen, 2021) for podcast guests and listeners. In fact, surveys of podcast listeners show that revealing personal and intimate stories strengthens the parasocial relations to podcasters (Schlütz & Hedder, 2021). For the podcasters, the conversational format provides comfort when telling their deeply emotional and personal stories and allows for new realisations and insights to emerge. As Spinelli and Dann (2019) have noticed, engaging in deep and open-ended conversations and interviews is a key motivation for podcasting. Academic and podcaster Siobhán McHugh (2007) has argued that the purpose of interviewing is to gain new perspectives and have one's awareness changed by participating. Similarly, to conversate and interview is, essentially, why Baraka, Yasin, and Nielsen podcast. In fact, Yasin explained that what makes her continue are the conversations with her fellow podcaster and podcast guests. Conversating through independent podcasting provides new perspectives on their own experiences and thoughts about challenging norms and enables the podcasters to share these insights with their listeners.

In short, Baraka, Yasin, and Nielsen seek to challenge norms by revealing their own and guests' lived experiences with navigating and confronting social norms and discussing these norm-challenging issues in a nuanced, intimate, and open-ended way. Independent podcasting as a conversational, unrestricted, and freely available medium is essential for creating new insights and realisations for themselves, guests, and listeners.

Challenging how to speak: Embracing various vocal expressions and wordings

As much as Nielsen, Baraka, and Yasin find it meaningful to conversate and interview, podcasting in most cases implies becoming familiar with listening to and editing one's own speech and interviews. Nielsen "hated it to begin with" because the interviews never turned out the way she had planned: "They become something else which may be even better than what you had in mind. But I think instinctively we women are enormously self-critical, always finding faults and flaws". For Nielsen, listening to her own voice through the act of podcasting prompts self-consciousness as well as reflections about being a woman, though, as previously mentioned, unpredictability might also be the purpose of interviewing (McHugh, 2007).

Similarly, Baraka, who has been editing the *ASATT* podcast for several years, still finds it "cringe cringe", because she thinks she sounds "very high-pitched and giggling", and Yasin, laughingly, said that she wishes she had been "media trained". Why is this so? Baraka reflected:

> Maybe we have learned that we should lower our pitch to sound calm, credible. But you can't control your voice if you have not been trained to. And why should you? I think [our voices] make our podcast easily recognisable, accessible, and intimate to listen to.

Thus, for Baraka and Yasin, "becoming native to the podcast" implies that they are no longer afraid of how they speak (i.e., their vocal expressions). They acknowledge the congenital aspects of their voices, thereby approving that vocal authority in independent podcasts is about sounding "real" and "authentic" (Copeland, 2018; Mottram, 2016). They are not trained to, nor do they intend to, lower their voices to conform to prevailing ideals of power. Challenging vocal norms is not the intention with their vocal expressions, but rather a side-product which they, eventually, must come to accept and even appreciate.

Apart from sounding high-pitched, Baraka and Yasin, in the interview as well as in several podcast episodes, verbalised that they use many English words and proverbs, and that Baraka speaks with a Jutlandic dialect (as she grew up in a minor Jutland city). Listening to the podcast reveals words from African languages and an extensive use of intellectual terminology (e.g., socialisation, racialisation, Eurocentrism, and intersectionality) combined with proverbs associated with the use of African American popular culture (e.g., they end several episodes by stating "May your fro grow and your skin glow"). The podcasters thus stage themselves as carrying and identifying with these sociocultural values: to be an English speaker, to grow up in Jutland (in which, at least during Baraka's childhood, speaking English as well as being Black was rare), to have African origins, to be intellectual, and to be inspired by and associated with African American culture.

The combination of these various vocal aspects is seldom heard in institutional media and thus nuances preexisting ideas of what it means to be a Black woman in Denmark. On the one hand, Baraka and Yasin's uniqueness may explain *ASATT*'s popularity within their listener community and, perhaps, the resulting media attention, which, then, is capable of

inspiring and influencing institutional radio and podcast production. On the other hand, comparable to the previously mentioned critiques of the *Dark Country* podcasters' voices, Baraka and Yasin are continuously confronted with how they speak. According to Yasin, people outside the *ASATT* community are repeatedly "stunned by the simple fact" that they speak Danish and find the combination of English wordings, Jutlandic dialect, intellectual terminology, and African American proverbs confusing and disproportionately concerning. Baraka clarified: "There is a complexity about how we sound. People struggle to understand that these different things can actually exist in a Black woman".

Challenging what to speak: Creating spaces for norm-challenging personal issues

ASATT and *ODF* represent the most widespread and traditional topics for women to podcast about—mental health and personal journals, and parenting, respectively—yet, their specific focuses within these broad topics are highly niche and non-traditional. Nielsen specified:

> [ODF is concerned with] how to live in a family which is not only about lunch boxes and children who can't sleep… It is about putting misunderstandings, prejudices, and barriers down, and getting some knowledge out there by talking openly about things… [because] everybody has their own ideas which are subject to prejudices.

To establish this openness, Nielsen decided that the first two episodes of *ODF* should be conversations between her and her husband, in which they disclosed their own family story and reflected on personal challenges with being parents for a child with autism spectrum disorder.

Yasin explained the motivation for starting the *ASATT* project:

> [We wanted to provide a space for listeners] who looked like us, were the same age, and talked about the same stuff we talked about with our friends. Also, we wanted to relieve some of the pressure from our Black friends, so that our White friends who want to understand [these issues] can listen to our conversations.

Baraka further explained the space their podcast provides:

> [*ASATT* is] a safe space in which we can tenderly hold each other accountable for our values and our thoughts. So, we must have some kind of experience and knowledge about what we are talking about. We must be willing to investigate and admit if we are wrong, and willing to reveal the processes and the journey we are going through.

Fox, Dowling, and Miller (2020: 300) argue that Black podcasters create "a nuanced sense of African-American trends, cultures, and lifestyles, which are now accessible to non-Black audiences". The same is true for ASATT, which non-Black listeners are welcome to listen to, but which, as Baraka emphasised, remains focused on identity from a perspective that is "not centred on whiteness". It is created for a specific community of Black listeners, by Black podcasters.

The process of crafting one's own space for personal norm-challenging issues is closely related to how Baraka and Yasin described the possibilities of independence. For Baraka, independence implies that they can "say something out loud to each other in a room where you are understood and where no one asks, 'Is it really true what you are saying?', or 'Are you not exaggerating?'" Yasin elaborated, "[Independence entails that] we are not interrupted and questioned as to whether our conversations are valid". With the aim of preserving their

independence, Baraka and Yasin have rejected several commercial opportunities. Notably, in 2019, they stopped collaborating with an established digital media outlet because, Baraka maintained, "we insist on talking about certain topics on our own terms". Building their own podcast and Instagram platforms enables them to discuss what they find important. With ASATT's increased popularity, they have been invited to participate in radio and television interviews, yet they rarely agree to do so. Yasin explained: "We don't want to discuss the N-word or whether racism exists or not. We simply don't agree with these premises, and we can make those demands on our own platforms which can be just as important as P1 [Danish Broadcasting Cooperation's talk radio station]". Thus, as academic and podcaster Dario Llinares has argued (2018), independent podcasters' freedom and control over production processes brings along a sense of status, impact, and power to compete with institutional media.

The possibilities of online listener communities

Independent podcasting as a cross-media ecosystem becomes apparent when considering how *ASATT* and *ODF* use Instagram, which the podcasters describe as the social media platform with the most followers and interactions with listeners. Consistent with what Fox, Dowling, and Miller (2020) note, reactions are solely supportive, most likely because independent podcast communities exist as "closed" groups which are difficult to search for and harass. If negative reactions occur, Yasin argued, they are intended to "make us aware of our blind spots, or the listeners just want to let out some frustrations aimed at the establishment".

Baraka and Yasin alternate between episodes with guest interviews and those consisting of conversations between themselves. Except for one monologue episode and the previously mentioned conversations between Nielsen and her husband, Nielsen is dependent on finding guests who are willing to tell their stories in the podcast. In addition, she performs all the podcast production and social media tasks alone as well. The workload of podcasting alone led to her putting the podcast on hold. On the other hand, considering that women are significantly less inclined to podcast together (the preliminary quantitative analysis shows that 13% of women podcast together in comparison to 30% of men), the flexibility of podcasting alone might appeal to women who must find the time in between the various tasks involved in running a household. Either way, as Wang (2021) suggests, production requirements of independent podcasting itself can be incompatible with family obligations, and therefore, Wang stresses, women's unpaid labour of motherhood, running a household, and childcare is the significant difference between female and male podcasters. For Nielsen, her podcast project contradicts with the labour of childcare to such a degree that—though it is not completely "mommy blogging" (Wang, 2021: 63)—it has become, at least temporarily, an Instagram "mommy blog".

In the following two sections, I discuss how Nielsen uses Instagram as not only an enhancement of, but also a replacement for, independent podcasting, and how Baraka and Yasin use the affordances of social media (primarily Instagram) to deeply engage with listeners.

Instagram as an emotional tool

When Nielsen started *ODF* in March 2020, she decided to change her personal Instagram account to a public and professional account instead of creating a new Instagram account

for the podcast. She uses it to share and interact about podcast-related content: "People value when [Instagram content] is personal, when they can follow our everyday life as a family". Motivated by followers' engagement, Baraka, who is mainly responsible for *ASATT*'s social media content, has decided not to schedule social media content in advance, "so that it does not become this factory-like Instagram with planned, generic content". The podcasters seek to make their Instagram content authentic and personal in order to create a close relationship with their listeners and followers. This "need" is enlarged by the fact that they are podcasting about norm-challenging aspects of their own or guests' mental health, personal journals, and family life, which demands a tremendous amount of emotional support. Podcast guests may provide weekly emotional support, but social media followers enable daily and immediate emotional support to deal with the loneliness of challenging prejudices and normative understandings of issues closely related to their own personal life (see also Adler Berg, 2021b).

This motivates the podcasters to spend considerable amounts of time on personal interactions with like-minded followers: comments, stories, and Q&As, but mostly direct messages (DMs). Listening to their podcasts, it is evident that they often encourage listeners to send them DMs. Additionally, posting on Instagram always prompts personal interactions, which in turn convey a deeper level of obligation and commitment. Yasin explained:

> We can't […] post something without having conversations with people. We put a lot into answering people's questions, and in addition to the ten followers we [have time to] answer, we continue to answer… 90 per cent of the DMs are extensive messages from listeners turning their inside out. So, we give them the respect they deserve.

As noted elsewhere (Adler Berg, 2021b), personal interactions may become a double-edged sword. Nielsen devotes two hours every day on Instagram in relation to her podcast because of her growing audience:

> [The more followers,] the more time it takes because people are so nice, and they comment and write messages every single day. I love that people dare to share their personal stories with me. I don't want to disappoint anyone. I want to be able to respond to all messages, but at some point, it becomes impossible […] Some days I just want to delete the account, and other days I can't do without this community and all the acquaintances that have come out of it. I felt lonely until I found out how many others are in similar family constellations.

While her podcast is on hold, Nielsen uses Instagram to continue the conversations she usually has with podcast guests: "In the podcast, we talk into the microphones. The same thing now happens on Instagram. Talking about the difficulties as well as what needs to be celebrated in my life makes people share their stories too". By breaking social media's apparent glamorous façade, Nielsen has found a community which makes her feel less alone in her daily quest of challenging norms. The process is self-perpetuating: Her followers become generous and share their own struggles with navigating norms—and this makes her share even more of her own life.

Co-creating content with community members

Baraka and Yasin frequently consider how their followers interact with new episodes, and they use this information to mould and reevaluate their content. Baraka elaborated:

> More or less unconsciously, we use it to redirect our podcast […] If topics only resonate with White listeners, then we think about why, because we really want to target Black women. It makes us evaluate whether we meet our goals and the function we have for ourselves.

Even though listeners are not editors in the traditional sense, they perform some degree of editorial gatekeeping through social media interactions. Instead of trying to reach a broader audience by platform-optimising their content (Morris, 2021), the podcasters exploit Instagram data along with the stories, comments, and, especially, DMs to identify, address, and engage specific listeners.

Furthermore, DMs regularly provide the podcasters with ideas for new episodes, guests, perspectives, and issues to discuss. As much as independent podcasts are "closed" for outsiders of the community, they can be "open" participatory spaces for insiders of the community, according to Nielsen:

> I constantly get messages from people who write that they know someone who would like to share their story [in the podcast]. Someone asked if I had considered inviting a solo mom, and I thought, yes, it makes so much sense, though I had not thought about it myself. You can feel that people believe in the project. They don't just listen to the podcast […] they come up with ideas. They can see that the podcast is so open that it allows for influence, and this gives rise to ideas for what they would like to hear about.

Yasin and Baraka likewise receive DMs from listeners who suggest podcast guests and issues for future episodes. If a listener suggests an issue relating to an upcoming episode that has already been recorded, Baraka and Yasin may use this issue for their weekly talk (17:00–18:00 every Sunday, following the release of a new podcast episode) on the voice-based social audio platform Clubhouse. Baraka provided an example of this:

> A listener wrote to us: "I am looking forward to listening to your episode [about sustainable capitalism] because how can I perform within capitalistic structures as an anti-capitalist and anti-racist?" And so, we used this dilemma for our following Clubhouse-talk.

Other times, to save time and thought, Baraka and Yasin ask Clubhouse participants to jointly discuss a listener's question that they have received beforehand in an Instagram DM. While the affordances of Instagram allow for daily interactions between podcasters and listeners, Clubhouse provides an opportunity for podcasters and listeners to get to know one another better, as Yasin explained: "We benefit from listening to people's thoughts and hopefully they also feel that they get closer to us". Baraka and Yasin do not plan any agenda before their Clubhouse talk, and this, according to Baraka, "creates a free space for listeners to give their own take on the issues we discuss. And, like podcasting, there is no video on. You can sit on the toilet while still having a deep thought". Thus, for Yasin and Baraka, social audio apps—Clubhouse, Spotify's Locker Room, Twitter Spaces, and others—provide opportunities for deeper engagement with their listeners and followers.

Conclusions

This article has addressed the possibilities of independent podcasting for women by asking the following question: Why and how do women use independent podcasting and their social media platforms to talk about mental health, personal journals, and parenting while at

the same time challenging norms? To answer this, semi-structured interviews were carried out with the hosts of two norm-challenging independent podcasts: the mental health and personal journals podcast *A Seat At The Table* and the parenting podcast *Our Different Family*. The analysis shows that the podcasters use independent podcasting to talk about their own personal, norm-challenging issues (i.e., their mental health, personal journals, and parenting) for two reasons. First, the lack of visuals provides the freedom to speak without worrying about appearances, which is significant when podcasting about personal norm-challenging issues. Second, the conversational, unrestricted medium of independent podcasting allows for creating, receiving, and distributing nuanced, in-depth insights and realisations about challenging the norms that afflict their own lives. They use podcasting to create their own spaces for issues which they find important but unrepresented by institutional media. Independence allows them to be radical in approaching and challenging the norms. This is the reason why they are reluctant to collaborate with or participate in institutional media outlets, which could eventually provide them with mainstream exposure. Their aim is not to reach a broad audience or be acknowledged by "outsiders", but to benefit their like-minded core-listeners. Who listens is much more essential to the podcasters than how many. Furthermore, by combining various wordings and acknowledging congenital aspects of their voices, they challenge gendered vocal norms in a way that is seldom possible through institutional media outlets. Finding one's voice (as understood through its dual conceptualisation) by means of independent podcasting affords the process of constructing their own identities.

While the podcast medium provides a platform from which to create and distribute unrestricted content, the affordances of social media platforms allow the podcasters to engage deeply with like-minded listeners. They use Instagram—and, in *ASATT*'s case, additionally the social audio platform Clubhouse—to build a tight participatory space and extend the sharing of experiences and strategies to navigate and challenge oppressive structures and prejudices. Interactions with listeners on social media platforms provide the podcasters with feedback, content ideas, and, last but not least, emotional support, which is essential for the podcasters to feel less alone in their norm-challenging quest. Instead of optimising their podcast content for distribution platforms to reach a broader audience and new listeners, they intensify their use of social media platforms and create presence, immediacy, and engagement among already existing listeners.

Independent podcasting constitutes an important feminist research area, as it allows marginalised voices and communities to take up their space by speaking about what they want, the way they want, and to whom they want. The stories that independent podcasters tell are made public through the podcast technology which proves suitable for raising awareness, broadening understandings, and even mobilising publics around certain issues—such as changing normative understandings of what women should say and how they should say it. The preliminary quantitative analysis presented in this article shows a gendered podcasting sphere in which women tend to podcast about traditional female domains such as mental health, personal journals, and parenting. Yet, the qualitative analysis reveals that the two podcasts within these traditional female topical categories are not necessarily reproducing norms, but are rather norm-challenging, in that independent women podcasters—as discussed elsewhere (Adler Berg, 2021b)—speak about their own lived experiences as women *in order to* challenge gendered norms. Through independent podcasting, they can build their own

"feminist world" (Ahmed, 2017) and speak freely about the profound emotional labour that comes with being a woman.

Future (quantitative) research should investigate what women and men podcast about in other countries and further explore women's reasons for podcasting about certain topics—including how independent content creators are affected by women's increasing visibility in traditional media. The quantitative data here lacks diversity, since only cisgender identities are present in the sample. Combined, the gendered topics and the lack of diversity in the sample suggest that independent podcasting is influenced by homogeneity and cultural conservatism. If the sample included larger or several geolinguistic areas, more genders would probably have been present, which would have allowed for investigating how and why a broad range of genders uses independent podcasting. Furthermore, as gender constitutes the only variable in the quantitative mapping, to code the age, race, or physique of a speaking voice would provide new insights and significantly differentiate the understanding and uses of the medium. Finally, this article has briefly touched upon how women experience their own recorded voices, and this question should be further explored in comparison with how men experience their own voices.

CHAPTER 19

The Business of DIY: Characteristics, Motives and Ideologies of Microindependent Record Labels

Robin den Drijver and Erik Hitters

Cadernos de arte e antropologia 6, no. 1 (2017): 17–35.
https://doi.org/10.4000/cadernosaa.1192.

Abstract

This paper examines micro-independent record companies, mostly set up by musicians according to the Do It Yourself (DIY) principle. They serve as distribution channels for counter-mainstream, often local, music. This paper discusses the characteristics of micro-(DIY) independents in the Netherlands and their rationale and motives in the context of persisting uncertainties in the music market. Earlier research (Hesmondhalgh 1998b, 1999, Strachan 2003, 2007) on micro-independents in the UK demonstrates their typical moral or political motivations, aiming to counter the hegemony of the capitalist mainstream music industry. The analysis is based on business information and open (qualitative) interviews with 14 companies in Netherlands. The paper shows that DIY-independents want to contribute to broadening the supply of contemporary music. By releasing indie genres and engaging in the associated social discourse, they differentiate themselves from the commercial majors. Commercial or financial success is not considered important and they adhere to collectivist ideologies. However, they do not aim to resist the dominance of the major music industry.

Keywords

DIY, micro-independents, music production, sociology of music

Introduction: Do-It-Yourself

The global market for recorded music is largely dominated by three major record labels. These majors' (Sony Music, Universal Music and Warner Music) market share is about 70 percent of the entire global music market (Leurdijk and Nieuwenhuis 2012). One common criticism of these global companies, is that they typically operate in the mainstream market consistent with a commercial, capitalist corporate ideology, with little attention paid to the creativity of the artist (Negus 1995, Hesmondhalgh 1999, Frith 2000, Strachan 2007). In addition to these majors, there are numerous small record labels, from larger independents to very small micro-independents.

This paper examines such micro-independents, often set up by artists following the Do It Yourself (DIY) principle, to serve as a distribution channel to issue their own counter-mainstream ("indie") music and that of other local bands and artists (McKay 1998, Moore 2004, Strachan 2007). By appropriating DIY and indie as emic concepts, micro-independents actively position themselves within broader classification processes in the music industry. Our research looks at the characteristics and business structure of micro-DIY independents in the Netherlands and their rationale and motives in the context of the current uncertainty of the music market. Previous research by Hesmondhalgh (1998b, 1999) on independents and Strachan (2003, 2007) on micro-independents in the United Kingdom shows that they are typically grounded in moral or political motives, aiming to counter the hegemony of the mainstream music industry. The question is whether such motivations also play a role in the Netherlands. Exploring the Dutch case will add to our understanding of micro-independent music companies, expecting that a smaller musical culture in a somewhat peripheral country as the Netherlands may offer a very different context than the sizeable and globally dominant British cultural industries.

Technological developments in recent years have opened many doors for DIY artists. They can be described as musicians who want control over the production, promotion and distribution processes of their music. Typically, these processes are kept separated from major professional record companies and the professional networks surrounding them. Such DIY-artists are characterized by the in-house production of their music. Recording is mostly done at home, in "home" or "bedroom" studio's (Hesmondhalgh 1997, Hibbett 2005), using relatively cheap, often digital recorders. Distribution and sometimes sales take place within very small business structures, with a minimum input of finance and human resources. Such companies are called micro-independents.

Usually, DIY musicians aim at forms of alternative expression, by idiosyncratic and autonomous production and distribution of their artistic products (Moore 2004, Choi 2009). Moore calls this the DIY-ethic, in which artists, musicians and participants attach great importance to the fact that music should be judged on creativity and authenticity. The DIY ethic opposes the mainstream music industry, with its emphasis on large production budgets, rich sounds, professional instruments and thoughtful "performing skills" of the artists (Moore

2004, Hibbett 2005, Choi 2009). In this context, the term mainstream refers to the mass or large scale production of popular music (Thornton 1995, Hibbett 2005).

For DIY musicians, the internet is an important medium for the distribution and promotion of their music, as it appears to offer substantial creative freedom and autonomy (Hibbett 2005, Choi 2009, Kruse 2010). Arguably, new technologies such as the internet can be used by musicians to secure creative control over their productions (Karasas 2002). Not only have they transformed traditional processes of music production and distribution, they have also contributed to the increase in the supply and consumption of different types of (popular) music (Leyshon et al. 2005, Handke 2010, Oliver 2010). Musicians today can promote and distribute their home-produced music virtually free of charge, as user-created content, separated from professional spheres to wider regional, national or international audiences (Kruse 2010, Oliver 2010). The digital home recorder is considered a crucial link, as it allows relatively cheap professional-quality productions. Furthermore, Kruse (2010: 633) suggests that digital recorders have made important contributions to the rise of the indie pop and rock music in the 1980s, as well as the recognition of lo-fi productions, classifying such music as authentic (Hibbett 2005: 56). Alternative DIY approaches to music production, promotion and distribution, are therefore considered to have eroded traditional power structures within the music industry (Hesmondhalgh 1999, Strachan 2007, Kruse 2010). Our study aims to not only shed more light on the practices of (Dutch) micro-independents, but will also contribute to the academic debate about theoretical notions of augmented possibilities for counter-mainstream music in the internet era.

Theories on DIY Independents

Most research on DIY music production and micro-independents is based on British or American cases. Strachan (2007) describes DIY micro-independents as very small record companies, established mostly by one person or a small group of friends. They release music albums on a small scale (sometimes only one or two a year) under a private label.

Small-Scale, Collectivism and Networks

The characteristic small scale of all aspects of their business operations sets these micro-independents apart from mainstream music companies. British studies show that micro-independents are generally run by only one or two individuals, who take on all organizational tasks (Ibid.). Albums are usually released by simple agreements between the label and the artists, often based on mutual trust (Banks et al. 2000, Crossley 2009). Micro-independents in the UK are typically run from home (Strachan 2003). Characteristic of these record companies is that they often work with local artists. Bands or artists are often personal acquaintances, but many labels also issue releases by their owners or employees. DIY micro-independents rely heavily on working in cooperative networks with other small cultural organizations, such as venues, distributors, record stores, recording studios, bookers and agents. In his work on local music, Crossley (2009) similarly points at strong network ties between musicians, fanzines and distributors. These networks are characterized by mutual communications, support, exchanges and recommendations. Becker (1982) and Crane (1987) suggest that such social networks create close relationships between artists and their audiences and can thus

can serve as independent distribution channels for cultural expressions. Crane (1987) claims that artists who participate in such networks also often support each other. A social network links them to other artists, stimulating aesthetic or artistic innovation. Networks can generate new artistic ideas and act as a source of information about works and activities of connected artists. British micro-independents are frequently affiliated with international DIY networks in which other small record companies participate (Hesmondhalgh 1999, Strachan 2007).

Collectivism distinguishes DIY independents from profit-oriented record labels on the hegemonic mainstream market (Hesmondhalgh 1999, Strachan 2007, Crossley 2009). They embrace an aesthetic of openness and accessibility, in which musical interests prevail over profit motives or commercial success (Strachan 2007: 252). Collectivism is based on creating or expanding a support network, in which the participating labels see each other not as competitors, but support each other where necessary. In that way micro-independents attempt to gain access to the production and distribution processes of popular music. Crossley (2009) shows how such networks of independent music production generate an autonomous dynamism and structure. This dynamism may challenge the dominance of major record labels and the resource distribution and conventions of the music industry (2009: 30). Network connections between musicians, DIY micro-independents, their audiences and other participants can confirm collective participation, autonomy, creative freedom and close social or artistic relationships. This discourse of autonomy and independence is diametrically opposed to that of the dominant and commercially oriented majors (Hibbett 2005).

Symbolic Resistance and Art/Commerce Discourses

Professionals in the mainstream music industry are often criticized for their disinterest in the quality of music (Williams 1981, Hibbett 2005, Strachan 2007). Genres unknown or less popular, are deemed unsuitable for major record labels. As a result, majors nowadays hardly release music of unknown talent (Carvalho 2008). Major labels show no interest in musicians in small niche markets, selling at most 20,000 copies (Weissman 2003). The music industry is characterized by the super star phenomenon (Rosen 1981, Hamlen 1991) which leads to huge income differences between successful and unsuccessful musicians (Cox, Felton and Chung 1995). The practice of many independents can be regarded as an expression of symbolic resistance against the capitalist discourse within the mainstream music industry. The motives of musicians to be signed by a DIY independent often find their origin in aversion against the corrupt and capitalist system of the mainstream music industry. They define their own practices by differentiating them from the commercial mainstream (Hesmondhalgh 1999, Hibbett 2005). The conscious choice for small scale is the answer of DIY independents to the commercial operations of major record companies (Rosen 1997, Strachan 2007: 248)

In Strachan's (2007: 247) opinion, the differentiation from larger mainstream record companies is central to the micro-independents legitimation (Berger and Luckmann 1966: 104). Views or conventions about aesthetics and music as an art form are regarded very important by the employees of micro-independents. Additionally, they may be considered as justification for their behavior, contrasting it to the commercial, profit-oriented record companies in the mainstream music market. Both Rosen (1997) and Strachan (2007) stress that micro-independents oppose commercial gain or other profit goals. According to them employees are aware of the low monetary gains of their ventures. For them, the creative artist

or the attention to access and the development of the artistry of musicians is central. Rosen calls this the "access aesthetic" (Rosen 1997: 3).

The contrasting ideologies about the access to and value of music as a cultural product, are referred to as art/commerce binaries (Strachan 2007). This dichotomy is central to the debate among musicians, fans and critics on how rock music's value should be assessed (Weinstein and Weinstein 1999). Those critical of the commercial production of mainstream music, often talk in terms of manufactured pop music. Manufactured here refers to artists who are "created" or "invented" by the commercial industry. Such "fabricated" acts therefore, lack any artistic value, according to the supporters of the art principle (Weinstein and Weinstein, 1999). It is believed that the priority of commercial music production is making profits, rather than artistic innovation or creativity (Hibbett 2005, Saha 2011). However, Frith (1983) indicates that commercial rock musicians in reality are no different than other entertainers. They may likewise be blamed of being in the music business for the money. This is opposed to the innovation-oriented and music-based anti-commercial DIY ethic.

Similarly, Strachan's research shows that employees of DIY independents believe that artistic creativity suffers in commercial, large scale, profit-oriented mainstream music businesses (2007). The typical small scale production of micro-independent record companies, following Hesmondhalgh (1998b), O'Connor (2008), Rosen (1997) and Strachan (2007), can be characterized as a distinctive feature of pure art products (Bourdieu 1984). In keeping with his field theory, this way of producing ensures a high degree of autonomy. Oppositely he places mass cultural production, aimed at making commercial cultural products. Bourdieu (1996) perceives popular music as commercial culture, produced and distributed to provide financial (or economic) capital. Hibbett (2005), Hesmondhalgh (2006) and Strachan (2007) however, stress that alternative, independent music production may be conceived as examples of small scale restricted cultural production. Negus (1995) also nuances this contradiction by showing that for virtually all players on the market it is difficult to draw boundaries between making "creative" or "commercial" decisions, regarding the industrial production process of popular music. He argues that creativity and commerce are always very closely related.

DIY Motives, Genres and Classifications

The motivations of DIY micro-independents to engage in music production may often be considered political or moral (Rosen 1997, Hesmondhalgh 1998b, Strachan 2007). Political and moral motivations can be seen as a way of resisting the dominant, capitalist-oriented discourse, used by the major record companies. For this reason, some independents try to transform or to democratize the system (Hesmondhalgh 1998b). They aim to promote counter-hegemonic or non-mainstream genres (Hesmondhalgh 1999, Strachan 2003, 2007). These genres are also known as "indie" genres, including punk, post-punk, indie pop, space rock, psychedelic rock, post rock, krautrock, lo-fi and many electronics genres (Strachan 2003, Hibbett 2005). A genre can be considered as a class or type of art (DiMaggio 1987). Wright (1975) believes that genres can be regarded as artistic works characterized by certain shared conventions and contents.

As indicated by Hitters and Van de Kamp (2010), the use of different types of genres by recording companies can be considered a form of classification. By releasing indie genres and engaging in the associated social discourse, independents differentiate themselves from the

commercial majors and labels. The distinction is reinforced by the fact that the latter companies hardly deal with the release of non-commercial an unprofitable music. By responding to genres outside the mainstream supply, small record companies create opportunities to enter into competition with the majors and to contribute to the diversity of contemporary music (Peterson and Berger 1975, Dowd and Roy 2010). Especially the interactive internet may play an important role, by the mostly free dissemination and promotion of music (Oliver 2010).

The previously discussed symbolic resistance, as well as alternative and collectivist business operations, can be interpreted as characteristic DIY practices to counter the commercial music industry. DIY micro independents thus oppose the power dominance of the majors. Strachan (2007) suggests that by releasing indie genres, British micro-independents try to influence music consumption. Nevertheless, despite their small-scale limited production, micro-independents often aim to be part of the public debate on musical taste. Hibbett (2005) ironically calls them the "scholars and conservators of good music" (p. 60).

Symbolic Rewards

Artists (such as musicians engaged in micro-independents) who distribute their own work themselves or through small networks, must have self-supporting abilities (Becker, 1982). Crane (1987) explains how autonomous artists know that they will never get rich by selling their art, because in the end the sales are just not enough. Therefore, in addition to their artistic work, they have normal day jobs, mostly art related.

It is considered an advantage that the autonomous self-supported artist is free to do whatever he or she wishes with the art created. Assuming an independent reward-system (Crane 1976), these artists retain control over the symbolic and financial rewards. Symbolic rewards refer to the benefits of respect or prestige and recognition of beauty or authenticity of the art product within the restricted field of art (Bourdieu 1996). Authenticity here, is considered a social construct, attaching cultural status to restricted field cultural products by setting them apart from large scale mass products (Peterson 1997).

Hesmondhalgh (2006) underscores that symbolic rewards, typical for small scale restricted cultural production, also characterize independent music production. Also Strachan (2007) suggests that the practices of DIY independents shows the relation between production on a small scale and acquiring symbolic capital. Here, personal recognition and satisfaction are generally considered as rewards or success. Bourdieu (1996), however, also sees a link between autonomous art production on a small scale and a disinterest to the economic value of art or cultural products. He emphasizes that participants in small, autonomous art fields adhere to the art-for-art's-sake principle. Bourdieu (1996) assumes that participants in autonomous art fields are rich in cultural capital, but lack economic capital, and moreover, deem that to be unimportant.

DIY artists managing a micro-independent are often fans or enthusiasts with a passion for music. Strachan (2007) maintains that their main motivation is to personally (and financially) invest in artists or bands. Commercial or financial success is regarded as unimportant. A key motivation is to be involved in the recording and release process, as it is considered "being worthwhile in itself " (2007: 255). Among micro-independents, success equals satisfaction or a certain degree of personal recognition within the network sphere. An example of recognition is positive coverage in the music press. Also airplay on a radio station, which may

then serve as promotion for the release of an album, is considered as a form of recognition (Strachan 2003).

Research Methods

In this research we map the characteristics and business structure of micro-DIY independents in the Netherlands and their rationale and motives in the light of the persistent uncertainty of the music market. As research method, we have chosen the open or qualitative (semi-structured) interview, with a focus on social behaviors, beliefs, attitudes and experiences of the respondent (Boeije 2005). Besides mapping the characteristics of these small organizations, the aim was to understand the motives and beliefs of their owners and managers. Furthermore, this research also intends to chart working practices and attitudes towards majors and the mainstream music market. It is therefore of great importance that during the interview the respondent gets ample opportunity to put forward his or her opinions and points of view (Hijmans and Wester 2006). The more elaborately the respondent can talk about a particular theme, the clearer and more complete the potential result becomes for the interviewer to interpret. This can be considered a dialogue with an informal character or a conversation with a purpose (Hijmans and Wester 2006).

Substantive and theoretical considerations, derived from preliminary or previous findings informed the selection of these micro-independents (Hijmans and Wester 2006). We thus applied theoretical or purposive sampling, assuming a consciously reflected choice of respondents. The selection of Dutch micro-independents was based on characteristics (size, music genre, release numbers etc.) derived from findings of other researchers, most prominently the work of Strachan (2003, 2007). For this research fifteen employees from a total of fourteen micro-independents were interviewed. A topic list was used in the interviews, based on the literature review, thus giving the qualitative semi-structured interview a solid foundation in theory (Braun and Clarke 2006). The interviews took place between April 22nd and May 31st of 2011. The interviews were transcribed into documents with an average size of 16 pages. The contents of these documents was subsequently arranged by themes through a process of systematic thematic coding and content analysis (Braun and Clarke 2006).

Dutch DIY Micro-Independents: Characteristics and Ideologies

The examined micro-independents in the Netherlands are small organizations, in most cases established by one or two people. During the interviews it was found that these record labels often started to release the musical productions of the founders or those of friends. The largest part (10) of the examined Dutch micro-independents is still managed by one or two staff members. A small number (4) consists of a group of three or four friends. All have indicated during the interviews that their work is driven from a love or passion for music. Most of the Dutch micro-independents are also run from home. In addition to their work for the label, most staff members also have another, often artistic, job. In Table 1 an overview of the examined micro-independents is given. It is described which employees were interviewed and what their functions are at the record label. Furthermore, the tables provide the number

of employees in the examined micro-independents, as well as the founding year and place, the genres released and the average number of releases per year.

Label name:	**Employee(s) interviewed and function(s):**	**Total # of employees**	**Founded in:**	**Genres:**	**Avg. # releases (annually)**
Subroutine Records	Koen and Nick, owners and managers	2	Groningen, 2005	Indie pop, singer-songwriter	5
Betoontoon	Lasse, co-owner	3	Rotterdam, 2008	Experimental and electronic computer-controlled music	2
Laterax Recordings	Jorg, label owner	2	Rotterdam, 2001	Electro, indie pop, singer-songwriter	4
Snowstar Records	Cedric, owner and management	2 and 1 intern	Utrecht, 2003	Folk, indie pop and singer-songwriter	4
Dying Girraffe Recordings	Ingmar, owner and distributor	1	Rotterdam, 2001	Indie pop, singer-songwriter	4
Knife Slits Water	Maarten, co-owner	2	Amsterdam, 2006	Experimental, krautrock, (Neo) psychedelic	4
Eat Concrete	Teun, owner	1	Den Bosch, 2006	Electro (mostly), indie pop, shoegaze, psychedelic rock	4
Freebird Records	Marcel, co-owner	2	Leiden, 1998	Garage, stoner rock	2
Narro Minded	Gabry, co-owner	4	The Hague, 2000	Electro, noise, post rock	6
Beep, Beep, Back Up the Truck!	Nicolai, co-owner and management	2 and 1 intern	Utrecht, 2008	Indie pop, post rock, singer-songwriter	4
Stardumb Records	Stefan, owner	1	Rotterdam, 2000	Indie pop, punk	5
WOT NXT	Marcel, co-owner	4	Leiden, 1996	Indie pop, punk, singer-songwriter (mostly)	3
Bunker Records	Guy, owner	1	The Hague, 1992	Dark techno, electro, electro funk	12
Sally Forth Records	Minco, co-owner	3	Amsterdam 2007	Hardcore, indie pop, noise	4

Table 1: Overview of the 14 Dutch micro-independents, the employees interviewed and their functions, total number of employees, year and place of foundation, genres released and the average number of releases per year.

Small Scale: Production, Indie Genres and Classification

Dutch micro-independents produce on a small scale. In most cases they release about four productions a year. These productions are issued in editions of 150 to 500 pieces. As shown

in Table 1 independents exclusively release indie genres. These can be considered as non-commercial, counter-hegemonic music styles (Hesmondhalgh 1999, Strachan 2007) beyond the mainstream supply by the major record companies. By categorizing their genres within the indie discourse, these labels consciously present their music as distinctive within the realm of popular music (Hibbett 2005). Furthermore, the table also shows that the examined micro-independents are not limited to releasing one specific genre, while indie as a genre is not limited to these micro-independents. Gabry of Narro Minded describes why:

> The funny thing is that our audience, the people who feel challenged with what we're doing, mostly listen to all these different styles of music. It's not that we serve complete different markets. They're just people who love adventurous music. And that's just how we also see ourselves. It's not odd at all; there are just people out there with broad tastes and there's just a lot of music around. That's what I think. They're just music lovers, I guess. (Gabry, Narro Minded).

Nonetheless, with their focus on indie genres, it can be assumed that the micro-independents want to distinguish themselves from the majors (Hitters and Van de Kamp 2010). The interviewed staff members expect major record companies to mainly deal with the release of commercial and uniform mainstream music, in order to maximize financial gains. It is remarkable that most interviewees find the profit motive of the majors understandable. Generally they recognize that the majors have to produce commercially profitable music in order to keep their heads afloat. In so doing, they consider mainstream culture as a completely different industry or entertainment world. They accept that other conventions apply in this industry, that relationships between record companies and artists are not the same and that

Picture 1: A typical bedroom studio. Picture taken by Robin den Drijver. Reproduced with permission.

music is approached or assessed differently by majors. Clearly, they classify themselves as different from the major industry.

Distribution, Promotion and Business Models

Dutch micro-independents are usually actively involved in the distribution and promotion of their releases, in which they often also invest financially. Most see promotion as a very important part of the launch of a release, because they feel that the music should be heard by as many as possible. Also artwork and design of the album is often part of the label's job. It is common to initially seek a break even. That means that the label first needs to recoup the investments. Potential profits can be equally divided between label and band, the so-called 50/50 deals (Strachan 2003). Despite the fact that a number of Dutch micro-independents have outsourced distribution to specialized companies, most of them prefer self-established independent channels for distribution. However, at least one company also had a distribution deal with major Sony, a practice quite common among independents in general (WIN 2016)

Remarkably, most micro-independents do not financially support the recording of an album. Thus, they distinguish themselves from the majors, who on the contrary invest substantially in the professional recording process. DIY artists usually provide a readymade album, which they themselves have recorded at home in what Hesmondhalgh (1997) calls bedroom studios, separate from the intervention of the professional (major) studio sphere (see pictures 1 and 2). According to Hesmondhalgh (1998a) this is an important characteristic of DIY musicians. Artistic freedom and the possibility for bands or artists to work autonomously, is considered important by all micro-independents. Koen of Subroutine Records comments:

> Anyway, it's important to realize that the musician's freedom has been a core principle to us from the first moment we've established. Our bands possess complete creative freedom and the rights of their music will stay theirs forever. In our opinion, this also applies to other cases like the album design. (Koen, Subroutine Records)

Similar to the British labels, these companies almost never work with official contracts. Agreements between the label and bands are often only verbally discussed and more than one release per artist is never expected. The increasingly common 360 degree deals among majors, whereby income from performances and merchandising are shared with the label (Carvalho 2008), in order to reap maximum returns from a release, are unthinkable among micro-independents. The bands arrange their own performances and obviously, their revenues remain their own. Similarly, Dutch micro-independent labels are not concerned with income from band merchandising.

The internet is widely used as a promotional tool for spreading free (or paid) mp3's, streams or albums. Compatible to Pfahl's (2001) findings, the primary objectives are enhancing awareness for certain bands or musics. Social media platforms, such as Facebook and Instagram are widely used. In addition, the free distribution of music files is used to reach out to larger audiences within niche markets. Most Dutch micro-independents also work with internet services like You-Tube, SoundCloud, Spotify and iTunes, in order to generate additional revenue, but as yet returns are minimal. Inevitably, as such services are owned by global media conglomerates, these worldwide distribution networks also tie the micro-independents to the wider mainstream music industry.

Local and International Networks and Collectivism

The interviews demonstrate that the record companies engage in partnerships with both domestic and foreign labels in various ways. These network relationships often have the purpose to distribute each other's releases. In this way micro-independents support each other in distribution and sales. Such alternative distribution structures were also visible among post-punk and indie genres investigated in the 1990s by Hesmondhalgh (1997, 1999).

In general Dutch micro-independents are embedded in local as well as international DIY networks. Characteristic of these organizations is that they assume cooperation with other small companies without aiming at commercial or financial gains. Maarten of the Knife Slits Water label explains:

> Together with other small European record labels, we participate in some kind of network. With these labels we exchange a lot of releases, like a trade market. It's like: 'I send you ten of our records and you send me ten of yours'. That's why we have this small shop and a mail order of all these European labels, but also some American. We just support each other in the distribution of our releases. After some time, you get quite a few contacts in Sweden or Germany. It's really like a network, a little scene. (Maarten, Knife Slits Water)

There are also forms of cooperation between micro-independents and local and independent record stores. In addition, staff members maintain close contacts with fanzines, distributors, bloggers and journalists. Other network connections were contacts with music venues, pro-

grammers and recording studios. Similar networks were also found among the independent scenes studied by Kruse (2010), Hesmondhalgh (1997) and Crossley (2009). Characteristic of such network relationships is that they are based on mutual support, trust, advice and exchange. Collectivism then, may be considered an important ideological characteristic of micro-independents, both in the UK and USA as well as in the Netherlands (Strachan 2007). This collectivism places the importance of music above commercial or business interests. Nevertheless, as is the case with internet distribution, such networks are in many ways connected to the proliferated music industry as a whole. Venues, recording studios, festivals, agents, promotion companies and bookers, together with the micro-independents, need to connect to the wider music industry, in order for them to reach audiences and to get their music heard. In that way, micro-independents are as much tied to, and part of the mainstream music industry from which they often vehemently distantiate themselves.

Political Motives

Dutch micro-independents show much less oppositional political dynamics than their British counterparts (Savage, 1991, Hesmondhalgh, 1999, Strachan 2003, 2007). They do not aim to challenge the majors (Savage, 1991). Nor do they want to democratize or transform the music market (Hesmondhalgh 1999, Strachan 2003, 2007). One reason for this is that they understand that they have little financial possibilities and thus can only release music on a very small scale. Subsequently, competition with the majors is regarded as unrealistic or even naive. In addition, label staff realizes that the music they release, only appeals to a small niche audience. Lasse of the Rotterdam Betontoon label argues: "It's not my mission to overthrow the majors. That would be absurd to think, because with our type of music you simply can't overthrow any major record company. Fans of Lady Gaga are definitely not going to listen to the music of Alien Drones" (Lasse, Betontoon). In addition, Dutch micro-independents release their productions often only on vinyl and cassettes, thus limiting themselves to a small niche market from the start. After all, such sound carriers only appeal to a very small and specific group of music enthusiasts.

Dutch micro-independents then, consciously operate on small-scale restricted niche markets, similar to Bourdieu's field of restricted cultural production (1996). In a way, this may be considered political as well. As Hibbett explains: "As an elite sect within a larger field, indie rock requires its own codes, i.e. cultural capital, and therefore can be used to generate and sustain myths of social or intellectual superiority" (2005: 57). Similarly, limited financial resources and an appeal to small audiences are regarded as typical for artists, organizations and participants in such autonomous art fields. Characteristic of cultural producers within autonomous art fields is that often they are rich in cultural capital, but lack economic capital (Bourdieu 1996).

Moral Motives

Although there are no overt oppositional political motives among Dutch micro-independents, most labels do aim to enhance the diversity in the supply of music, since this music would otherwise not be heard. Like their British and American colleagues, they show moral motives. The drive or even obligation to promote "other music", can be interpreted as a motive to

Picture 3. Statement from Laterax Recordings, illustrating how internet distribution provides opportunities for reaching niche markets, that majors would ignore. Image is reproduced with kind permission of Laterax Recordings.

counter the power dominance of the majors. In addition, such a motive can also be considered as symbolic resistance (Strachan 2007). Despite their small-scale production orientation, they do aim to influence the taste dominance of the mainstream music industry. It is therefore a combination of aesthetic and moral motives, aimed against the dominance of the majors in the public sphere (Ibid.). Jorg of the Laterax label makes the following comment:

> Someone working for a major label simply just wants to find a band, or let's just say, make a band. And from then on everything is under control and ready to make as much money as possible. But we think the other way around. Our releases are meant to be very cool, authentic music. From that moment we try our best to find an audience, because we think our music should be heard by everyone. Our goal is to release music that's really worth listening and where you should listen to with full attention, so that listening to that music becomes an experience itself. (Jorg, Laterax Recordings, see picture 3).

The examined micro-independents find it important to support the bands and artists as much as possible, in order to allow these musicians to grow artistically. Dutch label staff gives their bands the time and space to focus on artistic or creative development. Dutch micro-independents regularly organize label-related events, offering their bands opportunity to perform (see picture 4). These may be considered as local promotional fora, as pointed out by Hesmondhalgh (1998a).

Taste Preferences, Autonomy and Symbolic Rewards

The examined record companies only release music if the staff fully support the band's or artist's work. They explain they have to be fully dedicated, in order to promote a band, otherwise the collaboration has no chance of success. Staff will only invest time and effort in music that is very close to their personal preferences. In short, these micro-independents only

release music they fully support, which refers to the autonomous nature of these record labels and the autonomous behaviour of their staff or owners. We can also observe a Bourdieusian link between restricted autonomous small-scale music production and a disinterest in the economic value of that cultural product (Bourdieu 1996). Almost all interviewees indicated that making money was never a consideration for starting their micro-independent.

Picture 4: A label related event by Subroutine records. Image is reproduced with kind permission of Subroutine Records.

As virtually all music is readily available through free downloads, the market for recorded music is generally perceived as very insecure (De Meyer and Trappeniers 2007). Owners and staff of micro-independents acknowledge that releasing indie-genres will not generate big returns. For this reason, personal fulfillment is mostly regarded as success (see picture 5). On the other hand, they don't want to lose money doing this, as they are also very committed to their company's continued existence. Also, Dutch micro-independents get symbolic rewards by way of recognition for their artists or releases (Crane 1976, Bourdieu 1996). For them it is particularly rewarding when their artists or bands get positive reviews and that the public responds positively to these artists, as Cedric of the Snowstar label explains:

> To me it's more important that reviewers consider the Lost Bear record as an amazing album, than that they write that I released an amazing record. I'd rather stay behind the scenes, but I do feel very related to a band that is positively reviewed because we've released that particular record together. So when a band receives good reviews I'm just as happy as the band is, for the simple reason that Snowstar was responsible for releasing that record. (Cedric, Snowstar Records)

Conclusion and Discussion

Dutch DIY micro-independents have many common characteristics, which makes them clearly stand out from the major record companies that operate on the mainstream market. The research shows that micro-independents primarily release music in order contribute to broadening the provision of contemporary music. Their releases can be specified as indie-genres, or non-mainstream music styles. Releasing precisely these indie genres may be conceived as a way of classifying, of distinguishing themselves from the major record companies or the mainstream music market (DiMaggio 1987). Commercial or financial success is not considered important by micro-independents, however most of our respondents do want to break even in order to keep their companies going.

With their releases, most micro-independents have the aesthetic objective to enrich the everyday supply of music. This may be interpreted as a moral motive to oppose the dominance of the majors, a form of symbolic resistance (Strachan 2007). The drive to influence the music industry's mainstream taste is to be conceived as an interplay of aesthetic and moral motives. In that way, the examined Dutch micro-independents share many properties with similar small DIY labels in the United Kingdom and the United States. There are many similarities between the business operations, the structure and working practice of these organizations. Furthermore, the motives to start up or take part in a record label are in many ways similar. The examined independents are all embedded in both local and international network structures, often genre-specific. Also, they value forms of collectivism and profit sharing, which again distinguishes them from the majors.

However, the interviews showed that for the Dutch, political motives are less important than for their counterparts in the United Kingdom. Overt political oppositional motives were virtually not found. Dutch DIY-independents do not have a mission to combat the dominant hegemonic system of the major music industry or to democratize the music market. A key difference is that British DIY-independents more often explicitly aim to compete with, or even overthrow the majors. The size and global dominance of the British cultural industries, in contrast to the Dutch, can play a part in this. Also Hesmondhalgh (1999) described the strong aesthetic and political fervor of British indies in the punk and post-punk era, which has its roots in the—perhaps more strongly politicized—British society. This may have to do with the fact that the United Kingdom has profounder political and social divisions than the Netherlands (Russell 2010). In the British situation there may be a stronger urge to compete against dominant cultural, political and economic elites. Both Strachan (2007) as Hesmondhalgh (1997) register the mission among staff of British micro-independents to compete with the major recording industry. Dissatisfied with the capitalist and corrupt mainstream industry, they have the determination to transform and democratize the music market. A salient difference with our research results is that such goals are completely absent among the Dutch DIY-independents. On the other hand, it is not clear to what extent the political motivations are still present today among staff of British micro-independents. Both Hesmondhalgh's (1997, 1999) and Strachan's (2003, 2007) research findings are somewhat dated, making it difficult to predict whether such political motivations have decreased or maybe increased.

In terms of market shares, independents slowly but gradually gain ground in the market for recorded music, even up to 38% according to the Worldwide Independent Network (Statista 2016, WIN 2016). In the contemporary music marketplace they are well positioned to capitalize on their lean organizations, their network structures and their digital as well as non-digital distribution networks. Such an observation suggests direct competition between majors and independents. Micro-independents, however, appear to operate not so much on that shared marketplace, but on a parallel market. This parallel market logic is underscored by both the usage of distinctive non-mainstream genre classifications as well as their denial of the economy (Bourdieu 1996) as displayed by the respondents in our research. Their primary motivation is the love of music and their contribution to the diversity of taste. Rewards are mainly symbolic, voiced in terms of pride and recognition. Nevertheless, as Hesmondhalgh (2006) rightly points out we cannot fully explain alternative independent music production as a Bourdieusian subfield of restricted small-scale production. As we have shown in this contribution, micro independents are inextricably bound to the field of mass cultural production. Only due to the overall growth of musical supply, technological innovations, audiences and the access to music, have micro-independents been able to establish themselves as a viable subset of the recording industry.

Theoretically, we have contributed to a deeper understanding of practices of cultural production in a non-dominant music industry as the Netherlands. Previous research into independents is virtually all from the United Kingdom or the United States. Because these studies are done from an Anglo-Saxon perspective, there is little comparison with DIY cultures in other countries. Subsequently, the establishment of micro-independents in other countries may well be grounded in different motives. Despite the fact that there seem to be many similarities between Dutch and British micro-independents and their staff, we hope to

have shown for instance the absence of political motives among Dutch micro-independents. Moreover, we can expect the dominance of Anglo-Saxon music in the global music market to influence the position of local DIY-micro-independents in most countries. Future research may shed light on those uncharted territories. Furthermore, we may expect that differences in different countries might vary consistent with the size and influence of creative or cultural industries, its relation to politics and cultural policy, local art worlds as well as linguistic, socio-economic and cultural-economic factors.

CHAPTER 20

Intervention for Inclusivity: Gender Politics and Indie Game Development

Stephanie Fisher and Alison Harvey

Loading ... 7, no. 11 (2013): 25–40.

Abstract

In this paper, we investigate the interplay between independence as a rhetoric, principles of feminist interventionist work, and different models for creating a more inclusive industry. Through clashing understandings of the needs of aspiring game developers, indie culture can serve to reify dominant narratives of the mainstream industry, including discourses that hinder female participation therein. However, there are successful models in which we can observe other, more inclusive, modes of welcoming previously marginalized and excluded groups, which can be taken up in other contexts for diversifying local indie game development.

Author Keywords

Inclusivity, indie game design, women in games, gender, community, feminist research

Introduction

Digital games[1] culture is no longer the exclusive domain of young males. The demographic landscape of this culture is radically changing, particularly in terms of age and gender.

[1] We use the term digital games to refer to any and all digital games played online or offline, on a gaming con-

BY-NC

In 2011, the Entertainment Software Association reported that 38% of gamers in Canada were female, and almost 40% of those surveyed who were 55 years or older had played a game at least once in the previous four weeks. This reported diversification of the player base is not, however, mirrored in the games industry. A recent collective analysis of salary data from 2001–2011 reports that men still constitute 90% of the total games workforce, and have consistently outnumbered women in all fields over the last decade except in business operations and marketing (Shirinian, 2012). This unvaried developer base of digital games goes hand-in-hand with a relative lack of innovation and diversity in game representation, mechanics, and interfaces, leading to a market of largely homogenous games based on sequels and adaptations aimed at a population of heterosexual males aged 18 to 35, the de facto market of "hardcore" gamers (Fron, Fullerton, Morie & Pearce, 2007). If the industry hopes to keep their newly acquired market satisfied, and to attract potential players to digital games culture, diversifying the workforce will be crucial going forward. This recommendation to appeal to broader audiences is not intended to suggest that developers who are othered, or who represent difference, innately know or understand what these new and potential gamers want to play, but rather that including diverse perspectives in the design process may assist in disrupting this hegemony and homogeneity.

As Dyer-Witheford & de Peuter (2009) argue, "the game console has been very much part of the apparatus of 'becoming man,' and not of 'becoming woman'" (p. 18), and the context of their production plays a central role in this relationship. Because technological and computing expertise in general continues to be largely associated with the constitution of hegemonic masculinities (Connell, 2009; Corneliussen, 2012; Wajcman, 1991), it is unsurprising that there is a shortage of women working in the digital games industry. Strategic efforts to increase the number of women in the industry include creating women-only working spaces or special interest groups, awarding scholarships to female applicants to alleviate the cost of attending game design schools, and making visible the accomplishments of successful women in industry through celebration and promotion. These strategies are instrumental in making the industry appear more attractive to prospective students and supporting those already in the field, but offer little help or support for women who are just beginning a career in game design (e.g. new grads, women pursuing a second career or part-time job in games) or hobbyists. Addressing the needs of this under-served group is mainly carried out through the creation of locally organized, small-scale ventures that focus on training first-time game developers.

This paper reports on one such program: The Difference Engine Initiative (DEI). As a program that received a considerable amount of promotion and funding, the DEI is important for what it can tell us about perspectives on, strategies for, and (re)actions toward the organization and mobilization of community resources for social justice projects, especially since Toronto-based indie game developers are fiercely passionate about promoting and protecting the city's image as a model community for others in Canada and abroad to aspire to (Hawkins, 2012; Munroe, 2012). Indeed, investment in and attention to the question of inclusivity demonstrates a commitment by the indie community to address the exclusionary aspects of digital games culture that its corporate counterparts have yet to make. This declaration is consistent with how the indie community, broadly positioned as an alternative to

sole, computer, or handheld gaming device.

mainstream digital games culture and characterized by an anti-corporate sentiment, promotes itself as appropriate stomping grounds for grassroots social justice movements. Finding, creating, and enabling means of support for activist work is crucial for sustainability, and en masse, the Toronto indie community firmly plants itself in the corner of women who want to make a name in games. As the first community-directed initiative in Toronto dedicated to generating knowledge to improve the experience of female game developers, we explore the interplay between undertaking messy, complex, and contentious feminist intervention work and maintaining status as a 'model' indie games community.

DEI was a Toronto-based workshop intended to support the entry of women into the indie game community. We became involved in this initiative as invited participant-observers [2] and documented the results of the workshops (also known as incubators) using ethnographic methods such as semi-structured interviews, researcher observations, surveys, and participant journals, which were contextualized by our immersion in this community through our attendance of local presentations, showcases, networking events, and meetings of the Toronto indie game collective, the Hand Eye Society (HES). We consider the numerous community discourses around and within DEI to understand how inclusivity was envisioned, sought, and sometimes obstructed. Through a feminist analysis of how the program was conceptualized and subsequently delivered, we explore the paradox of focusing on inclusion and gender politics in the context of a set of practices that emphasize discourses of independence and meritocracy. We argue that given this underlying ideological emphasis, the indie game scene in Toronto also struggles with its aim to produce diverse and inclusive work, and it is no more egalitarian or compatible than the mainstream industry in supporting social justice projects.

Indie as Resistance

In comparison to mainstream gaming, which reflects, reinforces and (re)produces the dominant understandings of what counts as legitimate participation in video game culture (Jenson & de Castell, 2010), coming to a determination of what constitutes 'indie gaming' is a slippery task. The exploration of this shifting terrain (i.e. what is or is not indie) directly impacts questions related to inclusion, and we encourage readers to see Lipkin and Ruffino's contributions in this edition, which discusses indie games culture more broadly. For our purposes, the indie identity that we report on here is a particular, local subject-position that was discursively constructed through and by conversations with and between participants, organizers, and other Toronto-based indie community members.

A reoccurring theme that underscored many of our conversations with developers and players was the given understanding that 'indie' not only refers to an employment or career alternative to working in large gaming studios, but also implies a particular political position; one that is held in opposition to what mainstream games culture represents, sanctions, promotes, and protects. As a "hegemony of play" (cf. Fron, Fullerton, Morie & Pearce, 2007), mainstream games, in their content and production, communicate dominant values, and some indie games make use of the same modes to convey alternative or oppositional perspectives.

[2] The authors took on the role of what the organizers called 'embedded academics' and fully participated in the incubators alongside the other women, including developing and showcasing a playable game in DEI1. Stephanie was the embedded academic in DEI1 and Alison in DEI2.

For example, some indie games make very purposeful artistic decisions that are not popular or common practice in mainstream game design, such as: an amateur[3] kitschy style that evokes a homemade aesthetic, "regressive" 8-bit styles that are re-appropriated as a nostalgic celebration of early games culture, and even illustrating characters whose bodies challenge hegemonic expectations of how men and women should be represented (see Parker, this edition, for a discussion on indie game art). These examples can be understood not only as a choice to ignore mainstream art norms, but also as very intentional decisions to respond to and subvert dominant practices in game art and design, making these choices political statements that represent and offer a viable alternative to participating in mainstream practices.

The use of subversive design tactics are part of a discourse that constructs and positions indie game developers as resisting the dominant global hyper-capitalist structure of the video games design industry (Dyer-Witheford & de Peuter, 2009). Within this discourse, mainstream game publishers are portrayed as heartless, faceless corporations who are interested in profits, not people. This argument was typically qualified by referencing examples of gaming culture's normalized-yet-offensive practices that sanction sexism, racism, homophobia, and other prejudices for the sake of catering to the "hardcore gamer" and maintaining the hegemony of play (Fron, Fullerton, Morie & Pearce, 2007). This discursively constructs the Toronto indie gaming scene, including indie games, players of these games, and developers, as a productive counter-culture—a viable, alternative space where practices of contestation or resistance are encouraged and indeed a part of 'being indie'. Despite this insistence on difference through a disavowal of the mainstream, the Toronto scene is just as homogenous, characterized as "primarily populated by white dudes" (Goodyear, 2011). This lack of diversity is a major concern for several leading members of the Hand Eye Society (HES), a not-for-profit collective of projects and people working in Toronto's indie game community: "there are so many underrepresented groups—it's time to deal with that and to change that" (Woo, 2011). As part of a broader diversity initiative,[4] HES created DEI in recognition of, and as a way to begin to address, issues of gender inequality in their community.

Indie Intervention for Inclusivity

The primary purpose of DEI was to help Toronto-area women create their first digital game. The 12 participants were selected based on their responses to a competitive application process that received interest from 65 women.[5] The DEI was run twice in 2011; the first

[3] This statement does not imply that indie games are or should be considered amateur productions, or that indie game developers are amateurs in terms of their skills and/or professionalism in comparison to professionals who work in larger studios. Rather, the point here is that this art style is used as a response to the overemphasis on art realism and 3D modelling tools as representative of "better" (i.e. more expensive) games.

[4] DEI was part of TIFF Nexus, a provincially funded initiative to explore a range of emerging trends in interaction design (one of which was diversifying the field and industry by bringing in and working with marginalized groups) and foster connections between academics, industry members and enthusiasts. Additional information about the TIFF Nexus project can be accessed at http://tiffnexus.net. Please see to Harvey & Fisher (forthcoming) for further discussion of DEI participants' activities within the TIFF Nexus network.

[5] The women selected to participate in DEI were middle class, born in North America, between the ages of 20–30, of Caucasian or east-Asian descent, and had completed some form of post-secondary education. Most participants were either involved in a new media or technology-related career (e.g. freelance illustrator, graphic designer, film production, network administrator, professional blogger, etc.); however, none were working in the games industry prior to their involvement in DEI.

incubator (DEI1) in August–September, which was led by two members of HES, and the second incubator (DEI2) in November–December, which was organized and coordinated by two females who were participants in DEI1. In both incubators, the participants met once a week for three hours. These meetings were opportunities for participants to show their weekly progress, troubleshoot technical issues, provide and receive feedback, and discuss other topics related to game development. Actual game development labour (including conceptualization, concept art gathering, programming, drawing, and animating) was completed outside of these meetings. Local female mentors and role models with industry experience were invited to some of these meetings to share their perspectives and experiences on working in a male-dominated space. At the end of their incubation, participants had an additional two to three weeks to finalize their games, which were then débuted to the general public at well-promoted showcases.

Conceptualized by the HES organizers as a first step towards addressing gender inequality, DEI was intended to be an interventionist space that would make a positive difference in the lives of the participants (who were considered to be marginalized), as well as the community:

> "We will take a handful of participants with little to no game-making experience, but who are passionate about games and are interested in learning what goes into making them—these are people with ideas and the desire to make them a reality, for whom the opportunity to get into game development has either been absent or unwelcoming...It's important to note that this Initiative is not the perfect solution to all the problems of gender disparity in this industry, nor is it intended to be. We are hoping to generate some data and theories as to why there aren't more women in game development, and are hoping to learn how to make future endeavors more effective at encouraging and satisfying a more diverse group of people in this industry."
>
> Metanet (2011)

This statement demonstrates a much-needed political commitment from industry leaders to actively seek out and/or create these opportunities and openings; not only providing the means for the experience, but also co-constructing knowledge that can be shared and mobilized going forward.

Undertaking interventionist work to break down barriers is imperative to opening up a culture to the disenfranchised, but can also be potentially problematic when the existing and largely *invisible* power relations and structures that organize these relations are not explicitly recognized in the planning, implementation, or analysis of these interventions. Even the best-intentioned programs, practices, and people operate within the racist, heterosexist, patriarchal, and capitalist hegemonic orders they seek to topple. Concerns over the distribution of power within these initiatives and how this distribution impacts on the relations between those involved need to be critically considered (Frisby, Maguire & Reid, 2009; Krumer-Nevo, 2009). This requires organizers to (re)think through their assumptions and presumptions about what they are doing and the capabilities of those involved, and deliberately disrupt the practices that have worked to exclude women in the first place, because "the point of productive equity work is not to reproduce the situation, but change it." (Jenson & de Castell, 2011, p. 156). Speaking directly to these concerns, critical feminist researcher Patti Lather (1991) proposes that interventionist work must be guided by theoretical and methodological frameworks that are grounded in dialogue, reciprocity, and reflexivity in an

attempt to circumvent what she identifies as the central danger to praxis-oriented empirical work: the imposition and reification of dominant, hegemonic values.

Interventionist initiatives that are not conceptualized as mutually-educative experiences for both participants and organizers risk importing, uncritically, taken-for-granted notions and educational practices that work to restrict or limit the ways in which learners experience agency and authority in the process of knowledge construction. Programs based on educational givens assist in concealing the forms of power that naturalize inequality and mutual-exclusion between 'instructors' and 'learners' and can thus unintentionally perpetuate the issues that the program is meant to address. Indeed, some of the participants (those in the first incubator—DEI1) described aspects of the program that they felt were counterproductive to creating conditions of possibility for working towards inclusivity. There was a disconcerting disconnect between the stated goals of the program and how participants' felt upon their exit, which we argue is reflective of the organizers' reluctance to stray from 'business as usual' practices of the indie community and risk engaging in practices where the outcome was unpredictable. In the following sections, we identify and analyze moments before, during, and after DEI1, where opportunities to implement participant-driven changes were passed over in favour of staying faithful to established practices, and in effect, maintaining the status quo.

The Aspiring Female Game Developer and Her Barriers to Entry

Programs designed to educate, intervene, or assist disenfranchised populations are anchored by a representative subject who embodies particular characteristics that the program is meant to address (McDermott, 1993). More often than not, these subject-positions are constructed by program organizers and informed by personal experiences, reported trends and findings (such as media reports and scholarly articles), and sometimes stereotypes. For instance, due to the protocols of academic institutions (e.g. applications for funding and ethics approval), researchers are sometimes required to construct particular subject-positions before they actually make contact with study participants.[6] Although this practice can be viewed as problematic, in that it is an example of the powerless being labelled by a more powerful group (Freire, 2000), it is reasonable to temporarily construct a starting point subject-position, so long as agency to modify this construction is not limited to organizers and it is not used as a blanket representation for all participants beyond this starting point.

In the case of the DEI, the "aspiring female game developer" subject-position, and perceptions about the barriers that prevent her from entering the field, was constructed through the language employed in various documents, including the call for participation, the program FAQ, blog posts, and early media interviews publicizing the initiative. A discursive analysis of this initial subject-position can provide valuable insight into the underlying conceptual framework through which the HES organizers understand females' experiences and relationships within game development culture, locally and broadly. Within texts about the DEI, the aspiring female game developer was constructed as someone mystified about the game development process in general, intimidated by programming, and lacking access to tools, visible role models, or experienced people to help solve design or development problems. This construction—the

[6] An exception here is when researchers employ a participatory action research (PAR) methodology and framework, where participants are (typically) involved in the research process from the initial stages.

helpless, unknowledgeable female—is highly stereotypical and largely reflective of (working to reinforce) the hegemonic framework and guiding patriarchal discourse of digital games culture at large, which is founded on a binary and mutually exclusive understanding of gender where males are naturally proficient with technology and women are not.

This discourse extends past the sphere of digital games culture. It is the normalized ways in which people conceptualize their everyday interactions with technology (Connell, 2009; Cornelissen, 2012; Wajcman, 2007), and it is plausible that some women choose not to engage with game development because of these very reasons. However, many of the women interested in DEI *did not* identify with the organizers image of first-time female game developers. For instance, at the first pre-incubator information session for DEI, attended by over 40 women, a significant number of potential participants spoke about their enthusiasm to learn programming languages, named female game developers that they held in high esteem, suggested software and resources that they had previously tinkered with, and, overall, provided a great deal of evidence that directly challenged the imagined subject-position put forth by the HES organizers.

Participant contestation to this subject-position continued into DEI1, where the first discussion revolved around how participants enjoyed access to the very things that organizers assumed they lacked: experienced friends and colleagues (support), knowledge of game development software (tools), and females working in game-related careers who we admired and were inspired by (role models). Moreover, everyone had very clear ideas and goals about what they wanted to accomplish—for their game, but also within the larger diversity project—and what they needed to make that happen. Despite this, as the weeks went on and it became increasingly evident that the participants were neither helpless nor unknowledgable about game development, narratives about aspiring female game developers were not modified to better reflect the identities and experiences of the participants in DEI1. From a feminist intervention perspective, forgoing this opportunity to tell a very different story about female game developers is inconsistent with the goal of promoting alternative knowledges to disrupt business as usual, yet entirely consistent with maintaining existing power structures.

A closer look at the language used to describe the program can be illuminating here. Incubators, for example, are meant to create or provide the optimal conditions for a specimen to not just survive, but grow and thrive. Significantly, an expert who possesses knowledge of how to keep the specimens alive determines these perfect circumstances. Those who are subject to incubation are very much dependent on these experts, who are in full control of the incubator environment. While this description is appropriate for the operation of actual incubators (such as those used in medical contexts to assist in the care of premature offspring), this model of expert-administered care and nurturing is problematic in a social justice equity project because it positions learners as dependents and implies that they do not possess an understanding of their own ideal, optimal conditions to thrive in the environment. Adopting a stance that views knowledge as dynamic and power as fluid between everyone involved would means that *everyone's* knowledge and understanding of this issue is, and can only ever be, partial and limited. This challenges the conceptual organization of DEI1 that positions the HES organizers as the experts. Even though it did not reflect the situations of the participants, insistence on the subject-position and incubator model enabled HES organizers to maintain exclusive authority to validate what 'counts' in this culture, such as legitimate barriers to entry.

Significantly, some of the reasons DEI1 participants articulated about why they had not yet developed a game were due to barriers that were not explicitly recognized by organizers as such. Although participants pointed to time—both inopportune and a general lack of it—as the main reason, their hesitancy to create a game was also partially due to the sexism, misogyny and marginalization that they had experienced in Toronto and elsewhere as visible females engaging in public game related activities (playing games, attending conventions or socials). During a DEI1 session, one participant described how she felt awkward attending HES socials, as though she was intruding on a private invitation-only affair. She shared how the noticeable lack of other women at these events made her feel unwelcome, which prompted other participants to share similar experiences, such as how they felt that they required to bring a male escort to these events to legitimize their presence, but not their participation—in these spaces, women are immediately read as the (non-gaming) girlfriend of a male attendee instead of a person who is also interested in game design and culture.

Even though the saturation of men in the Toronto indie games community was a rationale for the creation of the DEI, organizers did not consider participants' experiences as a barrier to entry into the community. As the president of a small indie development team, and a co-founder of HES, the female organizer of DEI1 [7] offered embodied-evidence or proof that gender is not a significant enough marker of difference to prohibit entry and subsequent success in this industry. During sessions and in public interviews, she (re)articulated her view that people "only need to motivate themselves to learn and seize the opportunity" if they want to make digital games (Goodyear, 2011). Although she shared her experiences of sexism in the industry (e.g. clients only wanting to talk to her male team members and not her), she was unwilling to concur with the participants' view that harassment and general misogyny were a significant barrier to career success. Rather, she advised participants to develop a thick skin and to not take it personally. However the "it's not personal, it's business" discourse works to exclude women in two ways: (1) It effectively naturalizes the organizing patriarchal values of the culture and industry that make it difficult for women to be and feel successful, and (2) it also keeps the business world a male-domain by characterizing female responses to inequitable situations (taking it personally) as irrational, which has a long standing association with femininity, and is not valued.

The organizers' strategy to play-down the motivational power and significance of emotions/emotionality in the game development process reflects a zero-tolerance stance on what are perceived to be feminine expressions, and reinforces gaming spaces as domains for enacting traditional masculinities. Here, emotionality is viewed as potentially detrimental to achieving industry success, needing to be kept under control. From this perspective, success depends on the woman's ability to take on, or at least perform, masculine traits that are valued in a

[7] We focus on the actions of the female organizer in this paper because she played a more active leadership role in DEI1 than the male organizer, who acted as her mentor. Although they referred to each other as co-organizers, in practice the female organizer did the work of facilitating the sessions and communicating with participants and journalists. Having the female organizer lead and represent DEI1 was a strategic move to hedge the (anticipated) criticism of a male presence within a designated female-only space. The implications of this male gaze/surveillance of the DEI1 participants and the female organizer were not lost on researchers, participants and the journalists and community members who followed the activities of DEI (cf. Creighton, 2011).

business context (stoicism, toughness). Instead of recognizing how sexism is operationalized to exclude females and strategizing how to make it more inclusive, it is individuals, not the system, that are labelled as the problem and the ones that need to change. In this deficit model, accomplishment in the game development industry is premised exclusively on a meritocracy—anyone can make a name in games if they just try hard enough. In this way, systemic inequalities and oppressions are disavowed and responsibility for overcoming challenges is delegated entirely to the individual, regardless of whether they have the necessary privilege.

Participants of DEI1 felt a loss of authority in that the organizers' experiences, sentiments, and knowledge were valued over their own, which were met with critiques of female sensitivity and emotionality, as articulated by the female organizer at the Game Developers Conference:

> "The DEI was designed as a creative space where people could challenge themselves, develop their abilities and learn alongside one another in a warm, encouraging environment. But instead, [the incubator] was viewed as a support group underscored and necessitated by the reaction to an unequal social world, and where learning was secondary to the formation of bonds and relationships."
>
> Alexander (2012)

Closing down opportunities to gain an understanding grounded in other experiences about the lack of female game developers in Toronto not only goes against previously-stated intentions, but is also another example of structural inequity between organizers and participants, as well as highlights how women's experiences continue to be trivialized and their voices silenced. The absence of a dialogic or reciprocal working relationship made participants feel that they were being wrangled into subordinate positions in relation to the organizers—the inferior "aspiring female game developer" who allows emotions to get in the way of making games.

Modelling the Indie Way of Doing Things

In praxis, making a difference requires that the knowledge, culture, and conditions of those on the outside should be privileged over dominant cultural values. Those who commit to improving the lives and conditions of the excluded are critical cultural workers, and they should be the ones to struggle with the hegemonic values that are present in society and within themselves (Friere, 1970). DEI was promoted as an intervention to tackle issues of inequality and it is therefore unsurprising that participants expected that equality would be the framework guiding their incubator experience, both in terms of how they interacted with organizers to make games, as well as how they would work to create social change, as partners.

Organizers of DEI1 presented themselves as equals by creating games alongside participants; however this did little to erase the clear hierarchical relation between them. DEI1 was conceptualized as a traditional model for teaching and learning, where novices learn from experts and the "exchange" of knowledge and ideas works as a unidirectional transmission.[8] As previously mentioned, employing a top-down model in a community education initiative implies that experts fully understand the issue at hand and know how to fix it. Indeed, before they had met participants to ask what they needed, the organizers had already outlined a full curriculum for the program based on what they believed participants needed to become

[8] To be clear, our criticism of this model is focused on how it (again) relegates participants into a subordinate position, not the pedagogy per se.

empowered. When the solution to perceived needs is an administered response, learners are viewed as consumers of a predefined pedagogy, effectively "rendered passive, positioned as the recipients of predefined knowledge and services rather than as agents involved in interpreting their needs and shaping their life conditions" (Fraser, 1989, p. 174; McDermott, 1993). The implementation of such a model demonstrates that contrary to the motivation of DEI and the intentions of the organizers, in practice, these incubators served to re-entrench an authoritarian environment that limited the agency of the participants through the persistent interpellation of a fixed and limited subject-position.

The adherence to a predefined model was a source of tension between organizers and the participants of DEI1. We would like to note that the DEI1 program is a carbon copy of the Artsy Games Incubator (AGI), an HES program encouraging artists to extend their practice to games development. Significantly, the AGI did not have a social justice agenda, nor was it a female- only space. Yet organizers did not modify the AGI program for use in DEI1—everything, from curriculum to delivery, remained untouched and was imported wholesale. This one size fits all approach to teaching game design—no matter who the participants are—ironically demonstrates an insensitivity to individual differences, as well as HES organizers' commitment to not disrupt established practices. When participants suggested alternative ways of doing things, these ideas were rejected because they challenged "how things are done." For instance, participants wanted to use Twitter to communicate with each other in lieu of email or the DEI blog hosted on the HES page, both which were found to be unsuitable for their needs. The participants' knowledge and frequent use of Twitter made it an ideal tool to facilitate a peer-mentoring educational environment, where they could make requests for help and also provide assistance to each other quickly and easily. Twitter was, however, a technology used by participants, but not the organizers. Organizers did not stop participants from using Twitter as the primary mode of communication, but they also did not encourage it, nor did they make an effort to use it themselves. If participants wanted help from organizers, they would have to approach them through the channels that the organizers themselves were comfortable with.

We argue that this tension around the use of Twitter is less about the tool itself, and more about what it represents and enables: direct peer-to-peer support and assistance disrupts the hierarchical structure that the incubator operated on. Organizers were not uncomfortable with learning a new tool, but with how it modified the way things were done. Indeed, in their pre-DEI written description of "support," for example, the contributions of local mentors and HES organizers are mentioned, but not peer-to-peer help networks: "we will be bringing in local mentors as well as providing lots of advice, tips, answers to questions, and support for the game makers" (Metanet, 2011).

A more significant example relates to the unveiling of the DEI1 games. To promote female visibility at the event, participants requested that they be able to stand on stage with the organizers and introduce the games personally. Independent game development was a potential full-time career option for some of the women and it was very important to them that they be known and recognized as individuals, and not lumped together and introduced en masse, or as indistinguishable from each other. This request was rejected on two grounds—(1) organizers insisted that the game should, and would, "speak for itself" and for you, and (2) the majority of the game-playing public does not know or care about the person behind the game

anyways. The use of two normative (and contradicting) discourses as a rationale to reject this modest request to increase female visibility (an issue they knew and experienced first hand at HES events) was troubling for participants, as it seemed counterproductive to the objective of doing things differently. This oddity was later bolstered when participants learned that the (mostly male) participants of the AGI were allowed to talk about their games at their social, and that the guest speaker of the night would be showcasing her work-in-progress game to the audience. When confronted about this double-standard at the DEI1 post-mortem, the organizers admitted that their decision was made out of concern for participants' reception within the community, as the high level of publicity and media attention on DEI was apparently producing a negative backlash from some male indie game developers as preferential treatment. The organizers wanted to simultaneously "protect" participants as well as appease community members who were upset at the special attention and perceived hand outs that these women were receiving. Such a response to the expressed desires of the participants is exemplar of both the paternalism of the top-down incubator model, as well as the contradicting discourses that circulated within the incubator, as protectionist measures do not align with the organizer's injunction to develop a thick skin.

These examples of tension are representative of the ways in which unequal power dynamics produced a schism between participants and organizers even though everyone involved was ostensibly working towards the same goal. Participants were expected to follow through with the program, but not make any changes to it or question the status quo of how things get done in this community of practice. As the weeks went on, participants became bolder in pursuing what they knew they needed and decided as a group to create their own conditions for empowerment, including making radical changes to the organization of DEI2 (which two DEI1 participants facilitated), and forming the basis for a community group focused on addressing the many barriers to entry and multiple potential types of aspiring female game developers, as discussed in more detail below.

DEI1 could be characterized as an expert-centered learning experience that sought to groom these female game developers for entry within the community in a way that was undisruptive to the existing power structures. It is important to note, however, that these tensions and conflicts had a productive outcome of creating conditions for group cohesion, which then led to the restructuring of the second incubator. In response to the authoritarian environment of DEI1, the facilitators of DEI2 took a collaborative approach in the conceptualization and execution of the second iteration, leading to a more democratic forum where organizers did not make assumptions of participants' capabilities, needs, or preferences. For example, instead of limiting participants to using object-oriented game development tools, DEI2 organizers offered a range of tools for all skill-levels for participants to consult, with the prerogative to also use tools that were not on the list or beyond the expertise of the organizers. While DEI1 participants only used two tools (Stencyl and Game Maker), DEI2 participants each used a different tool, ranging from Adventure Game Studio to Flash to Unity, and were much more experimental in terms of content and mode (see for example *The Immoral Ms. Conduct*, a game about young women's' experiences in prison played on YouTube, cf. Poplar, 2012). DEI2 participants were also fully involved in the planning of their showcase, which did not feature a guest speaker and focused completely on the participants and their accomplishments during the incubator.

Understanding the underlying causes for the friction in the first sessions enabled the leaders of DEI2 to foster a participant-centered environment that was inclusive, open to feedback, and subject to participant-driven change. Unsurprisingly, the DEI2 participants reported a greater level of satisfaction with their experiences. Significantly, the topic of gender-based discrimination and exclusion was one that emerged less frequently in DEI2, and we suggest that this may be because inclusion was intentionally built into the structure of this incubator as opposed to simply providing motivation.

Challenging Indie Ideology

These divergent methods of organizing DEI1 and DEI2 demonstrate how the use of particular dominant discourses can serve to maintain an exclusionary field of practice, whether it is in mainstream games culture or the indie games scene. In our conversations and observations, what was most pervasive and disconcerting was the sentiment that we are past the point where gender matters because we have achieved equality, and our success is solely premised on a meritocracy wherein individuals have the unhindered freedom to do and be all that they want. This perspective was articulated by one of the two organizers during her presentation "Why I Hate Women in Games Initiatives" at the 2012 Game Developers Conference on her DEI1 experience. When considering this disavowal of women-focused projects like the DEI, we can understand her hesitation to support the participants in ways they wanted as partly a product of her own personal experience taking up the female game developer subject-position; nobody helped her, she always felt like she needed to have a thick skin to deal with this environment, and she (as well as the very few other women in the industry) found success. However, this "if I can do it, you can do it too" attitude is problematic because it elides the important differences between her experience as a woman in indie game design and others who have faced other forms of intersectional oppression. The organizer's use of personal experience as evidence that women can succeed "without handouts" reproduces given ideological systems and does not allow us to see difference as constituted relationally (Scott, 1991). What is missing is recognition of other intersections with gaming culture (including, but not limited to, race, class, sex, age, orientation, and ability) that can constrain, as well as enable, what is considered to be legitimate access to and participation within gaming culture. Within the discourse of meritocracy—which is prevalent in the post-feminist, neoliberal sensibility that emphasizes the empowerment available through choice without addressing how political and cultural influences limit our choices—present-day women are autonomous agents that face none of the previous power imbalances (Gill, 2007). Here, women have recourse to free choice, and to succeed, the strategy is typically to become more like a man. This is in no way an inclusive strategy, as it charges those who wish to participate with fitting into a mould rather than questioning such a mould in the first place.

In this way, the indie culture that purports to be in opposition to the practices of the mainstream games industry mirrors some of the keys ways of excluding women from participation. The DEI was meant to introduce difference into Toronto's homogeneous indie game scene, and yet when difference was enacted or suggested, it was bypassed by HES organizers in favour of maintaining a construction of first-time female game developers that created minimal disruption to the status quo both within the incubator and in the com-

munity. Difference abounded in DEI: between participants, between participants and the 'aspiring developer' construction, between participants' and organizers' ideas of what was needed to feel empowered, and more than can be listed in this short paper. We do not doubt the sincerity of the organizers' intentions to diversify their community; however, we think it is important to recognize that the "add women and stir" approach we observed in DEI1 is not interventionist work that can make significant gains for women in the long run.

In many ways, the rhetoric of meritocracy reflects and indeed reifies the post-feminist and neoliberal context of digital games culture at large, where the increase of women players arguably diversifies the player population but the underlying framework continues to cast female participation as innately subordinate or inferior to their male counterparts (Harvey, 2011; Jenson, Fisher & de Castell, 2011). The numbers indicating broader participation in games culture are by no means an adequate signifier of cultural change.

New Girl in Town

Reluctance to deviate from sanctioned, normalized practices—whether it be the theories and methods we use, or the roles we play—can snuff out opportunities to experiment with different or new praxes that might improve the lives of those on the margins (Freire, 2000; Jenson & de Castell, 2011). Dominant ideas are not adequate to reverse the reproduction of the forms of exclusion that characterized the culture. A more appropriate starting point is critical dialogue and a profound respect for the disadvantaged and their knowledge. As adult women who were all too familiar with experiences and practices that cast them as always already inferior in the larger games community, it was disheartening to re-experience it in an initiative that was meant to introduce difference and change. We cannot ignore, however, the ways in which DEI laid the groundwork for more sustained and inclusive models of participation, and provided opportunities for women in Toronto to get into indie game development.

Despite the challenges, DEI had an extremely positive impact on the community, both in making women's game design and activist work visible. Furthermore, it directly shaped the revamp of the second incubator, and addressed how the community could accommodate demand for women-only workshops and spaces (i.e. how to serve the other women who attended the preliminary information session or applied to participate). Reflecting on their experiences in DEI1, participants and allies were more eager than ever to work towards fostering a more inclusive indie game development community in Toronto. This prompted several participants from both incubators to create a central group for women who did not necessarily have ties to other groups within the HES collective, and/or found independent representation intimidating. The work is currently being carried out by Dames Making Games Toronto (DMG), which acts as a welcoming committee to women new to the local game development community, and provides ongoing support to women who already work in the industry. As a work-in-progress feminist intervention space, DMG is committed to supporting women game developers and their allies through hosting casual socials, presentations and networking opportunities, training workshops and jams, and providing online support and outreach (for more about DMG, visit http://dmg.to and see Westecott, this edition).

The differences between the one-off, top-down incubator and the creation of a self-organized hub for female-identified developers can be understood in the important distinction

between emphasizing the individual woman who wants to break into a community of practice with established norms and the creation of a community that strives to be safe, welcoming, and inclusive of many different types of experiences. In the former, shaping participants into the indie identity as an already-constituted subject-position is prioritized, while in the latter, building a community with a shared goal of pushing back against exclusionary norms to foster the kind of environment that allows for many different identities to take up game design is the desired outcome.

DMG supports the growth of an emergent community by addressing needs that were not being met by the existing infrastructures around indie game design, and indeed challenges the solo auteur vision of the indie designer in general by emphasizing the important role of colleagues, collaborators and support groups for those seeking to engage in independent game design (Guevara-Villalobos, 2011). Independence refers not to the emancipated individualism celebrated in the rhetoric of neoliberalism but to self-supported and self-motivated labour that is often lonely, incredibly challenging, and rarely lucrative. Community can provide instrumental resources, as well as provide the support that was so denigrated within DEI1 when the organizers dismissed the importance of sharing experiences of sexism and exclusion as important to the production process, further advising participants to combat feelings of exclusion and inferiority by turning a blind eye towards elements and practices of a sexist culture.

While one can potentially seek out and receive assurance elsewhere, marginalized groups often face a different set of challenges in hegemonic spaces that are not often understood by those in privileged positions. Building a community committed to exploring and addressing these issues is vitally important to addressing barriers. For some, strong, supportive relationships can be as fundamental to the game development process as a computer, and while DEI participants took advantage of the networking opportunities and developed relationships with others in the larger Toronto indie scene, it did not replace the security and reassurance provided by the cohort of others in a similar position.

Conclusion

Being indie in no way translates to being inclusive. Rather, a great deal of the values and meanings associated with going indie actually reify the structural inequalities of the mainstream industry through the valuation of a supposed meritocracy that not only denies persistent systemic exclusion but celebrates in its own way the precarious labour conditions of digital games production. The process of becoming an indie developer in DEI1 was not a disruption, but an expansion, where those in power maintained their roles and status while the foundation upon which they stood grew through the expansion of the number of indie game developers, small studio start-ups, and transmedia engagements with game mechanics *within* the current frameworks and practices of production. Inducting more women into this 'model community' without questioning the dominant narratives of the system that excluded them was the identified solution, but participants pushed back, turning their efforts towards community-building activities that circumvented the legitimization of particular practices, objects, language, knowledges and subject-positions related to 'being indie'. By embracing rather than resisting the dynamism and variation of needs within, the members of DMG are

instrumental in rewriting what being indie in Toronto might look like and committed to actively creating opportunities and openings for difference to be engineered.

CHAPTER 21

From Art House to Your House: The Distribution of Quality Cinema on Home Video

Daniel Herbert

Canadian Journal of Film Studies 20, no. 2 (2011): 2–18.
https://doi.org/10.3138/cjfs.20.2.2.

Résumé

Cet article defend l'idée que certains distributeurs de vidéo maison ont joué un rôle important pour donner forme au déplacement historique du « cinéma de qualité » des salles de cinéma au contexte domestique. II examine plus particulierement la compagnie Kino International, Facets Multimedia et Zeitgeist Film pour comprendre de façon plus compléte comment se créent et circulent les notions de valeur et de qualité dans le domaine de la vidéo maison. Alors que Kino International offre une sélection éclectique de films étrangers et de classiques du cinéma muet et que Facets Multimedia se spécialise dans la production internationale, le documentaire et les film pour enfants, Zeitgeist se concentre plutôt sur le documentaire et les films d'une poignée d'auteurs choisis. En dépit des différences apparentes, chaque compagnie élargie, raffine et complexifie Jes critères constitutifs de la vidéo maison de qualité en se fondant et en redéployant les notions d'exclusivité, d'exotisme, d'intellectualisme et d'activisme social. En défendant cette idée et en faisant aussi allusion à de nouveaux services comme le site de distribution par transit de données Mubi, cet article fait valoir l'idée que la "distribution" est un moment déterminant où la valeur économique et culturelle du produit se façonnent.

Rights reserved by the author.

If we take it that "film" is a particular technology for the capture and presentation of moving images, and that "cinema" more broadly describes the social arrangements through which moving images are produced, circulated, and consumed,[1] then over the last several decades cinema has not "died" but rather proliferated and transformed.[2] Specifically, celluloid-rendered images and theatrical viewing practices have been ostensibly displaced by waves of different video technologies and the domestic consumption of media in general. In this transfer from one techno-social arrangement to another, the features that constitute "quality cinema" and "film art" have been contested and rearranged, although not upended entirely. As Charles Acland has indicated, media technologies do not simply disappear when new ones appear, nor do all the practices by which these technologies are used.[3] His point suggests the continual need to investigate the creation, exchange, and use of cinematic wealth and value in the face of technological change; in this case, to understand how distinction operates in the realm of home video.

Home video distributors have played a critical role in shaping the historical shift of "quality cinema" from theatrical to domestic contexts. As James Kendrick and Barbara Klinger have discussed, the most prominent among them is The Criterion Collection, which has created a canon of cinema based on exclusivity and eclecticism.[4] In addition to their highly selective catalogue, Criterion has also distinguished itself by providing rich "bonus" materials, such as commentaries by film artists and scholars as well as supplemental essays; further, the company typically promises to release only the best digital transfers of their movies. Yet, it is important to note that Criterion has not been the only player in this arena and the senses of "quality" they have cultivated comprise only one part of the larger distribution of attitudes toward home video.[5] This essay examines Kino International, Facets Multimedia, Zeitgeist Films, and Mubi (formerly The Auteurs), a streaming media website,[6] in order to more fully understand the creation and dispersal of notions of value and "quality" in the home video arena. Whereas Kino International provides an eclectic mix of foreign films and silent film

[1] This differentiation derives from Christian Metz, *Langage et Cinema, Nouvelle edition augmentee d'une postface* (Paris: Editions Albatros, 19TT), 7. I am particularly inspired by David James's use of this formulation in *Allegories of Cinema: American Film in the Sixties* (Princeton, NJ: Princeton University Press, 1989), 5–6.

[2] Anne Friedberg, "The End of Cinema: Multimedia and Technological Change," in *Reinventing Film Studies*, ed. Christine Gledhill and Linda Williams (New York: Oxford University Press, 2000), 438–452.

[3] Charles R. Acland, "Introduction: Residual Media," in *Residual Media*, ed. Charles R. Acland (Minneapolis: University of Minnesota Press, 2007), xv.

[4] James Kendrick, "What is the Criterion?: The Criterion Collection as an Archive of Film as Culture," *Journal of Film and Video* 53.2–3 (Summer/Fall 2001): 125. In her assertion that the Criterion Collection was influential in connoting a "high art" quality to certain DVD releases, Klinger has written that Criterion helped create "the perception that the digital era in theatrical cinema has finally found its aesthetic equivalent on the domestic front in DVD." Barbara Klinger, *Beyond the Multiplex: Cinema, New Technologies, and the Home* (Berkeley: University of California Press, 2006), 61.

[5] Where Kendrick focuses on Criterion's peculiar selectivity as a means by which archival practices and values have been transferred and democratized to some degree, Klinger focuses on the production of "collectability" as a quality of DVD cinema that is subsequently taken up by domestic media consumers. She highlights how the transfer of cinephilia into domestic movie consumption has been paired with technophilia. Ibid., 56 and 75.

[6] The Auteurs changed its name to Mubi on 13 May 2010. Anne Thompson, "The Auteurs is Now Mubi," Indiewire.com, 13 May 2010, http://blogs.indiewire.com/thompsononhollywood/2010/05/13/the_auteurs_is_now_mubi (accessed 14 July 2010).

classics, and Facets specializes in international, documentary, and children's films, Zeitgeist focuses on documentaries and a handful of select auteurs. Despite these apparent differences, however, all expand, refine, and complicate "quality" home video by drawing upon and redeploying qualities of exclusivity, exoticism, intellectualism, and social activism.

Additionally, these companies have used these techniques to contend with changes in the technological and cultural conditions pertaining to them. Some of these companies were able to distinguish themselves from the chaos that characterized the early days of home video distribution. In this way, what seems marginal and even elite served an important economic function. Further, despite the slipperiness of each company's identity, the relative stability of each firm's mission assisted them in creating and maintaining additional business endeavors, including theatrical distribution and exhibition. Perhaps most importantly, these companies were instrumental in converting highly refined notions of cinematic quality from one industrial/cultural arrangement to another, from theatrical to domestic distribution and exhibition.[7] This supposedly stable situation is itself characterized by turmoil and change, as seen presently by the growth of rent-by mail, video-on-demand (VOD), and internet streaming distribution systems. Thus each company faces new challenges and challengers, such as the Mubi website, that they are meeting according to their own logics, which are themselves extensions of their past actions.

In examining the operational logics of these companies, I wish to indicate the importance of distribution by extending the implications of the term. In the majority of media industry studies, "distribution" primarily refers to that sector of the industry that orchestrates and accomplishes the movement of commodities from producers to consumers. Indeed, in its industrially dominant form, it is the bottleneck through which the mass of productions must pass in order to reach their potentially vast audiences.[8] In critical political economic theory, however, "distribution" can refer to the general dispersal of wealth in a society.[9] These two meanings of distribution—the process by which specific commodities circulate as well as the social allocation of wealth—are best understood when set in relation with one another. In this sense, distribution is a determinant moment when the economic *and* cultural value of a commodity is produced. Conceptualizing distribution in this way is particularly important for understanding cultural commodities, as their value is so closely tied to the formation of ideas, beliefs, and social identities. Thus, assessing how such commodities accrue cultural value requires analysis of the ways in which the forms of their exchange bear upon their relative value in general.

Early Distinctions

Joshua Greenberg has argued that early video distributors "invented" home video, as companies like Magnetic Video were the first to conceive of using magnetic tape to play Hol-

[7] A similar argument regarding The Criterion Collection is made by Klinger, 60.

[8] This fact led Nicholas Garnham to identify distribution as the most important element to understanding the political economy of the media industries. Nicholas Garnham, *Capitalism and Communication: Global Culture and the Economics of Information*, ed. Fred Inglis (London: SAGE Publications, 1990), 161–162.

[9] As Marx wrote, "in production the members of society appropriate (create, shape) the products of nature in accord with human needs; distribution determines the proportion in which the individual shares in the product." Karl Marx, *The Grundisse* (London: Penguin Books, 1993), 88–89.

lywood films.[10] Analogously, Facets and Kino invented the idea of art cinema for domestic consumption; founded after these companies, Zeitgeist followed suit and navigated both the traditional and home theater markets. In large part, they accomplished this by distinguishing themselves from a range of alternatives. Frederick Wasser and Greenberg have described how, in its beginnings, home video distribution was neglected by the Hollywood studios, thus allowing a number of independent companies to enter the emerging field.[11] Many early independent distributors gained their foothold by releasing "side-stream" content, including workout tapes and children's programming.[12] Simultaneous with these numerous startups that specialized in non-Hollywood material, there was also a confusing number of mergers and acquisitions, and a proliferation of sub-labels within labels.[13] Although the Hollywood studios did open their own in-house video divisions by the beginning of the 1980s, their efforts were varied and tentative. They largely served as defensive responses to the prolific number of independent video distributors and music distributors who entered the video market.[14] Only in some cases did Hollywood studios work in-house to get their content via magnetic tape to retailers, thereby allowing for a space for independent video distribution, and even sub-distributors, or "middle middle men."[15] Thus video differed from theatrical distribution structurally, and fairly quickly in its growth it adopted a model based on the music business, where studios worked through wholesalers to bring their product to retailers.[16] These early years, from about 1977 to 1982, represent a moment of turmoil, change, and growth.

Eventually, however, the Hollywood studios gained control of the market.[17] Through the 1980s, they increasingly tried to homogenize the video market with a two-tiered pricing scheme aimed to promote the newest releases.[18] Their consolidation was augmented through the late 1990s through the general application of revenue-sharing practices on the part of corporate video chains and independent stores that used Rentrak as their distributor. These services allowed stores to guarantee that new releases would be available on "opening" weekends. As these endeavors prioritized "new releases" and "hit films," the home video rental market was rendered increasingly Hollywood-centric.

[17] Wasser, 183–184; McDonald, 123.

[18] Wasser, 131–135.

It is amidst and in contradistinction to these conditions that Kino International and Facets Multimedia defined themselves, gaining economic viability and cultural prestige, and even economic viability through cultural prestige. They offered comparatively "better" titles than Hollywood releases, meaning more selective, less tied to Hollywood release schedules, and displaying an affection for the "classic" and the "artful." In this business approach, Kino and Facets also distinguished themselves from the bulk of other independent distributors at the time, who more often than not catered in public domain titles, horror films, or cheap action films, a fact that rendered the very phrase "direct-to-video" a signifier of second-rate content that still lingers today.[19] Just as they distributed movies, they distributed an idea about movies, and about what counts as quality cinema and quality home media.

Kino recently released a "complete" version of Metropolis in theaters and on home video, blurring the lines between "art house" and your house. (Photo credit: Kino International)

Founded in New York in 1976, Kino distributed silent and "classic" American films to the art house theaters of the time. They released respected foreign films as well, as they were licensed to release Janus Collection titles in theaters. Donald Krim bought the fledgling company in 1977. After earning a law degree, Krim worked in the "non-theatrical" department of United Artists, which handled film rentals to college campuses and similar non-traditional venues.[20] This provided experience in getting films to audiences, in marketing

[19] This was not and is not universally true, as seen for instance with the "Original Video (OV)" and "V-cinema" industries in Japan. Mark Schilling. *Contemporary Japanese Film* (New York: Weatherhill, 1999), 29.

[20] Eugene Hernandez, "Positioned for the Digital Future, Lorber and Krim Still Favor the Big Screen," *Indiewire.com*, 9 December 2009, http://www.indiewire.com/artic/e/positioned_for_the_digita/Juture_krim_lorber_stil/Javor_the_big_screen (accessed 11 July 2010).

non-conventional theatrical releases, and in understanding the audiences who had a taste for such fare. Kino's focus was cinema that was thought to be "classic" rather than old, films that had earned prestige previously through awards or critical acknowledgment, such as films by Charlie Chaplin and Alfred Hitchcock. By the time Kino started its home video distribution division in 1987, they were already associated with quality cinema, "quality" here meaning American films from the past that remained historically important or aesthetically impressive, and foreign films both classic and new.

Facets Multimedia had similarly humble but distinguished beginnings. The company was founded in 1975 by Milos Stehlik and Nicole Dreiske as a film exhibition center in Chicago, which focused on international and American art cinema, non-Hollywood children's films, and experimental live performance.[21] By the early 1980s, however, the operation expanded to include an adjacent video rental store that specialized in "art house" fare as well as the distribution of art cinema titles on video. Stehlik set Facets, like Kino, apart within the field of media distribution at the time by treating movies on video as, in his terms, "cinema." Also like Kino, Facets began in the days before the VCR became a viable option for media consumption, and so worked within a frame of reference for "quality" cinema that derived from the celluloid and theater based context. Both companies thus upheld the notion that cinema is made for artistic rather than simply commercial or entertainment purposes, and displaced this notion from celluloid and the art house theater onto magnetic tape and the VCR. Their vision was to provide for the art house in your house.

Although newer and smaller than these other two companies, Zeitgeist Films has operated in an analogous manner and carved a comparable cultural space for itself. The company was formed in 1988 in New York, when, according to a producer there, the art house market remained viable, even if it was small and facing serious challenges. Unlike Kino and Facets, Zeitgeist still thinks of itself primarily as a theatrical release company, with home video being a necessary but adjacent element of their operations. One producer at Zeitgeist acknowledges the company's mission and stature by saying it does "boutique on a budget." They typically only release about six movies in theaters each year. Nevertheless, as they eventually distribute all their theatrical releases on home video, as well as a handful of titles for which they do not handle theatrical release, they remain an important name in the specialty video market.

Qualities of Quality and Techniques of Taste

Cultural distinction does not guarantee success. The owners and operators of Kino, Facets, and Zeitgeist had experience in the art house theatrical market. Their intervention was in attempting to bring this conception to a new technol ogy and into a new social pattern of use. In order to succeed, there needed to be a coordination among these distributors with a larger public, a set of retailers and customers who were amenable to conceiving of home video in similar terms. This suggests an alignment among social fields in which cultural goods accrue particular values; Pierre Bourdieu's work on social fields, taste, and cultural stratification is instructive on this point. "Taste," he famously wrote, "is a practical mastery of *distributions*

[21] Milos Stehlik quoted in Jason Guerassio, "Facets Multi Media," *Independent Film and Video Monthly* 26.6 (July/August 2003): 25.

which make it possible to sense or intuit what is likely (or unlikely) to befall... an individual occupying a given position in social space" (emphasis added).[22]

He elaborated how such taste values, or "dispositions," operate in the world of cultural production and circulation, and two elements of this seem particularly germane in the context of specialty home video distribution. First, he differentiates between "large-scale" and "restricted" production.[23] Where large-scale production "submits to the laws of competition for the conquest of the largest possible market, the field of restricted production tends to develop its own criteria for the evaluation of its products."[24] Second, this process of production and of the production of value resonates with a larger social sphere. For both the commercial and art minded cultural producer, he writes, the "ultimate and often indefinable principle behind his [sic] choices finds itself continually strengthened and confirmed by his perception of the selective choices of authors and by the representations authors, critics, the public and other publishers have of his function within the division of intellectual labor."[25] The specialty distributors discussed here have behaved analogously to the publishers of "classic" literature described by Bourdieu, by having actively fostered exclusivity, cosmopolitanism, intellectualism, and social activism. These characteristics resonate with elite and academic conceptions of film-as-art. Although these qualities of "quality" often overlap, they are identifiable in specific, concrete techniques undertaken by these distributors. Further, they used their accrued cultural capital to move from one technology to another and from one social use of media to another. In this respect, they have not just coordinated with a social formation, but altered it.

What Bourdieu calls "restricted production" aligns most readily with the quality of *exclusivity.*[26] The Criterion Collection has developed this strategy quite remarkably, as they only have around 500 film titles under their banner, but it is practiced by Kino International and Facets as well. Kino distributes a broad range of titles, including silent classics (the films of Buster Keaton), American independent cinema (*Daughters of the Dust*, Julie Dash, 1994), and "The Best of World Cinema" (*Himalaya*, Eric Valli, 2000). This breadth could appear to convey a sense of inclusiveness rather than exclusivity. Facets would also appear to be anything but restrictive at first glance, as they handle the distribution of over 70,000 titles. However, in both cases, the companies reveal rather strict parameters on what they release, namely movies that are outside the contemporary mainstream and that have pretensions of refinement. Although circumscribed by economic necessity, each company selects and promotes a rarified cinema.

In the case of Kino, this exclusivity is in part derived from their strong relationship with film archives and preservationist institutions. Specifically, Kino has been able to "branch out," in the words of one company employee, into American independent and contemporary world cinema because they have such a solid base in silent film classics from across the

[24] Ibid., 115.

[25] Ibid., 134.

[26] Exclusivity is not unique to "high quality" cultural production in the contemporary period. Low-brow video distributors, such as Something Weird Video, regularly make similar claims to exclusivity. Jeffrey Sconce has discussed the use of high-brow strategies by low brow cultural producers in ""Trashing' the Academy: Taste, Excess, and an Emerging Politics of Cinematic Style," *Screen* 36.4 (Winter 1995): 371–393.

world. Although they lost access to the Janus Collection films to the Criterion Collection, Kino behaves similarly to Criterion by relying upon a stable base of classics that can be sold and resold on a regular basis, such as *Battleship Potemkin* (Sergei Eisenstein, 1925) or the box-set *The Movies Begin*, which features a vast number of films representing all manner of early cinema. In the latter case, as well as with such collections as *Edison: The Invention of the Movies*, Kino's ongoing good relations with the Motion Picture Collection at George Eastman House is vital. The company has worked with this archive and others, including the Museum of Modern Art in New York, in order to obtain high-quality prints of films that have been previously consecrated. As Kino has successfully promoted these titles in the home video market, representing their interests and those of their institutional affiliates, these institutions then help Kino with subsequent projects, creating a virtuous circle of status and quality.

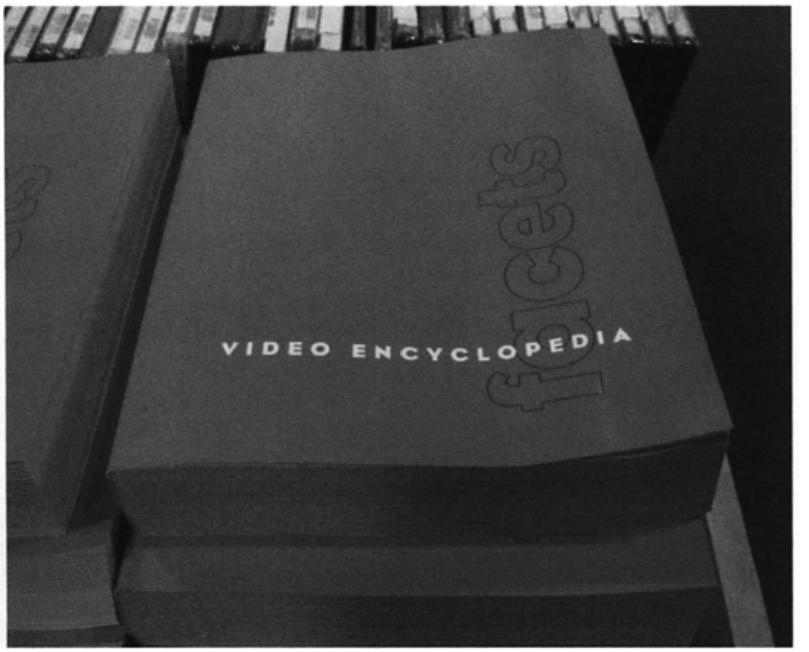
Another way that these companies maintain a sense of exclusivity is through their access to international cinema at film festivals and the distribution markets that occur there; moreover, this process conflates the sense of exclusivity with that of *cosmopolitanism*. Kino International regularly sends representatives to the festivals at Rotterdam, Toronto, Cannes, and Sundance, and Zeitgeist like wise sends scouts to these festivals and others that cater in international art cinema, such as Berlin. Certainly, this is not a surprising practice on their part, as the markets at international film festivals have served as crucial links between the production and consumption of world cinema for many years. The point is that by entering these markets and engaging in these social arenas, these companies position themselves in competition with larger distributors, such as the specialty divisions of the major Hollywood studios, which often focus on theatrical distribution. Even more importantly, participation in these festival markets aligns these video distributors with a stratum of cinema culture where select films gain early approval and cultural consecration. This puts Kino and Zeitgeist in a privileged position to internalize and subsequently disseminate the values regarding cinema fostered at these festivals.

Facets combines exclusivity with cosmopolitanism in a different manner. It should be noted that Facets does not in fact distribute the 70,000 titles they have access to; the majority of these titles are actually distributed by other companies, including Kino and Zeitgeist among others, and Facets serves as the wholesaler that brings these commodities to market. In terms of the titles they distribute themselves, Stehlik says that Facets takes a "curatorial" approach, seeking out and filling holes in the home video landscape. In practice, this can mean a single film title that is not available, but more often it means films produced in certain areas of the world that are under-represented in the North American market. Stehlik opposes this to what he calls the "clearinghouse" models adopted by Amazon and Netflix. As of today, he has said, "Facets Video hosts three exclusive video lines: Accent Cinema, a world cinema label that has particular strengths in Europe; Cinemateca, a Spanish world cinema label that features films from Spain and Latin America; the Facets Video label, a world cinema label that has particular strengths in Middle Europe, the Middle East, and American independents." Stehlik has said that they acquire "between twelve to eighteen films annually for exclusive release on the Facets label; [and] another twenty for exclusive distribution, and four to five thousand new titles every year for nonexclusive distribution." Whereas Kino offers "The Best in World Cinema," (although they demonstrate a particular strength in Russian cinema), and whereas Criterion provides a highly restrictive selection of "A-list" foreign films, Facets

has carved a niche within niche home video by distributing films from areas that are more under-represented than other more recognized national cinemas. Stehlik has publicly emphasized Facets's exclusivity, stating, "it is very difficult [for Facets] to distribute independent features that aim at a broad, middle-brow audience and which emulate Hollywood films or television. There are other distributors that are perfectly capable of moving these films into the marketplace."[27]

Whether dealing with their own titles or those that they wholesale for other distributors, Facets has been instrumental in distributing exclusive, cosmopolitan, and generally *intellectual* notions of cinema through their catalogue. Indeed, one can find that the ingenious organization of many specialty video stores actually conforms to categories instituted in the Facets catalogue, which generally follows accepted typologies of national cinemas and auteurs. For many years a print publication, the catalogue is now only online; they issued their last paper catalogue in 2007. Although the catalogue is accessed differently as a result, the logics about "cinematic quality" initiated in the print catalogue have maintained in the transfer to the digital format. As opposed to mainstream distributors and wholesalers such as Ingram Entertainment Inc., Video Products Distributors, Inc. (VPD), or Rentrak, which uphold a "new release" mentality that is reflected in the volume of New Release shelf-space in corporate chain stores, Facets's catalogue is quite particular in its categorization. As just one example, within the "European Cinema" division of the online catalogue, one finds a plethora of subdivisions, organized either by recognized directors, such as Tony Gatlif or Agnes Varda, or by country, such as Irish cinema or Norwegian Cinema.[28] This highly refined partitioning of cinema accords with the impulse toward taxonomization found in scholarly approaches toward film and other visual arts. Further, it helps to inform retailers and, eventually, video store browsers who must navigate (perhaps with the assistance of a clerk) these categories in order to find a specific title.

Somewhat similarly, Zeitgeist upholds a film-as-art notion of home video through their work with a small but specific selection of renowned world cinema auteurs. Two of the most notable are Atom Egoyan, particularly his early features, and Guy Maddin, with whom Zeitgeist apparently has an exclusive relationship due to longstanding positive interactions. This auteurism is quite personal in some cases. Because Zeitgeist simply does not have much money to devote to the production of extra features, they rely on the filmmakers themselves for "bonus" material. On the one hand, this renders their relationship with select directors intimate, but on the other hand, and as a consequence, the intellectual and creative singularity of these directors is reinforced by their involvement in the DVD production and marketing processes.



James Kendrick argues that The Criterion Collection constitutes a video archive of "important" films, and is able to consecrate its selected released as important films,[29] thus prompting consumers to evaluate the merits of *The Seventh Seal* (Ingmar Bergman, 1957) in relation to *Armageddon* (Michael Bay, 1998) and the *Beastie Boys Video Anthology* (various, 2000). What is the criterion, indeed? Alternatively, Kino, Facets, and Zeitgeist leave little question as to why

[29] Kendrick, 125.

their films hold value, particularly intellectual value. Kino does not constitute an archive, but rather provides access, for a price, to existing film archives and their ongoing efforts at film preservation and restoration. Facets is not precisely an archive either, except perhaps at their rental location in Chicago, but rather is a disseminator of conceptual categories by which to organize the otherwise unruly mass of non-Hollywood cinema. And although Derek Jarman may not command the same recognition as, say, Akira Kurosawa, Zeitgeist's adherence to an auteurist approach to their titles demonstrates a general faith in film-as-art (hence the need for a film artist) and a pseudo-academic impulse to categorize films according to a preconceived

The Facets Video Encyclopedia not only provides capsule reviews of innumerable films, it also functions as a catalogue for these titles, listing their price. The Encyclopedia is organized mainly by nation and director.

shared sensibility. Most blatantly, perhaps, Zeitgeist reveals an intellectualist approach to home video through their release of documentaries about contemporary philosophers and social theorists, including their films *Derrida* (Kirby Dick and Amy Ziering Kofman, 2002) and *Zizek!* (Astra Taylor, 2005).

The intellectualism disseminated by these companies is also internal to them as a general working philosophy and institutional objective. Many if not most of the producers and other employees at Kino and Zeitgeist have degrees in Film and/or Media Studies, and in personal interviews these subjects will cite this educational history as important to their current work. Milos Stehlik of Facets proclaims overtly that media education should be a mandatory element of pub lic education and should begin quite early in children's curricula. The emphasis on children's media at Facets, a genre that the company has promoted almost since its beginnings through the Chicago International Children's Film Festival, testifies to the company's sense of media as *enrichment* rather than entertainment. Indeed, in 1996 they released the *Facets*

Non-Violent, Non-Sexist Children's Video Guide.[30] This title presents a category of opposition more than of affiliation.[31] They also offer film appreciation classes at their Cinematheque on a regular basis, including such courses as "Cinema and Surveillance" and "Odd Couples: The Buddy Comedies of Billy Wilder." Facets's position is seen even more clearly in their status as a "non-profit, 501*(C)*3 organization, and a leading national media arts organization... [and their] mission is to preserve, present, distribute, and educate about film."[32] Their status as a cultural, educational institution has been recognized by the National Endowment for the Arts, the Illinois Arts Council, the John D. and Catherine T. MacArthur Foundation, the Chicago Community Trust, and the Academy of Motion Picture Arts and Sciences, all of whom support Facets with funding. The website for the National Film Registry provides a link to Facets below the question, "How do I obtain DVDs or videos of National Film Registry titles?"[33]

The intellectual pedigree embodied within these companies coordinates with and flows outward through their sales to educational institutions. As Stehlik recalls, the video transition of the 1980s devastated the market for 16mm film rentals, which teachers at both high school and university levels used regularly. Consequently, he states, many educators relied on Facets's video releases; apparently, they recognized and affirmed the sense of intellectual value Facets saw in these movies. In the case of Kino, it is their strength in silent cinema that makes them particularly valuable to universities with film history courses. One Kino employee states that the company's silent film packages, for instance, are "tailor made for college classes"; one thinks immediately not only of the Edison shorts or *The Movies Begin*, but also about Kino's releases of such film history standards as *Intolerance* (D.W. Griffith, 1916), *Metropolis* (Fritz Lang, 1927), or *The Thief of Bagdad* (Raoul Walsh, 1924).

This academic affinity suggests the creation and sustaining of a virtuous "circle of belief,"[34] if not an outright homology, among different social fields. Specifically, the value of cinematic art developed in cinematheques coordinates with that cultivated in academic settings, film festivals, and among cinephilic video storeowners. Kino, Facets, and Zeitgeist harmonized with these social fields and helped to deliver the sense of cinema developed there into the video store, into the home, and even back into the classroom. The social function of these companies in fact constitutes a soical activism. Facets's protectionist approach toward children's media has already been noted. Zeitgeist, alternatively, demonstrates a vaguely left-leaning but vehemently anti-corporate, anti-big-media agenda through their release of select documentary films, a disposition that accords with their own position vis a vis the mass media. Titles such as *The Corporation* (Mark Achbar, Jennifer Abbott, and Joel Bakan, 2003), *Manufacturing Consent: Noam Chomsky and the Media* (Mark Achbar and Peter Wintonick, 1992), *A Place Called Chiapas* (Nettie Wild, 1998), and *Trouble the Water* (Tia Lessin and Carl Deal, 2008) all attest to Zeitgeist's strategic commercialization of activist media production.

Even more than externalizing and projecting a particular political agenda, these companies demonstrate activism within the social field of independent media that they inhabit and sustain. In addition to the formal education that many employees at these companies attained, a large number of them have also circulated within a larger "indie" media sphere where cinephilia itself was a functioning ideology. During or after getting their college degrees, a number of these employees worked at independent video stores. As with many current and former video store workers, they remark upon the social interactions occurring at the video store as important elements of this position, making it more than just a job but closer to a vocation. One producer "admitted" to being a film buff, "guilty as charged."[35] Another distribution employee asserted that working at an independent specialty video store was vital to engendering a sense of cinematic breadth and eclecticism as *collective* values. "People who worked [there]," he stated, "felt very passionately about films and that was the place to be to be around people who felt similarly."[36] The strength of this harmonization is demonstrated particularly well by the fact that the primary sales representative for one of the companies was once the buyer at one of the largest and most respected independent video stores in the country. Here, a perfect reversal of roles reflects the interchangeability of the attitudes shared by each position.

This shared sensibility of media quality-for the sake of quality-regularly guides the choices and activities of these companies, making it a *de facto* mission and operating logic. It can be formalized, as in the case of Facets's status as a non-profit arts organization. "You have to build your own infrastructure," says Stehlik, "if you want to do something in mainstream culture."[37] More often, how ever, this sense of activism is informal and internalized. Given the financial constraints put upon both Kino and Zeitgeist, they cannot afford conventional market research or intense promotion of their product. Instead, they must gamble on the possibility that their clients and customers share their taste. At Kino, this can mean trying to repeat the success of one of their "hits," such as with their continuing line of avant-garde films from the pre-WWII period. Zeitgeist similarly has to do a bit of guesswork in predicting what will work for the company, but this guesswork is offset by past successes as well as the cultural capital that gets embodied by the individual employees and institutionalized through their decisions and actions. Although generally distributing documentaries, select auteur films, and independent art cinema, it is often chance and a producer's taste that guides the selection of film titles at Zeitgeist. In the words of one pro ducer there, who formerly worked at Criterion, one simply has to "believe" in the movies that they choose; they must feel a passion for them, or else the uphill battle against the economic limitations of niche cinema would be overwhelming. As Zeitgeist has no formal market research tools, they claim to generally "know" their market, basing their assumptions on past successes. Here, the "circle of belief" functions as a taste-based business model. Their faith in art cinema goes hand in hand with a faith that this is a disposition that they share with their customers. They trust that they will have customers because they are the kind of people who would be their customers.

The Future: Where Art...Art?

Kino, Facets, and Zeitgeist thus contended with the challenges of the changing home video landscape over the last twenty-five years. Each has managed to succeed in creating an identity for themselves, which in turn helped them create bridges from art house theaters to domestic media consumption and then from VHS to DVD. But media distribution is undergoing yet another transformation. In a recent *Los Angeles Times* article, the head of Home Entertainment at Sony Pictures acknowledged that DVD sales were declining rapidly, that Redbox was causing industry confusion, that Blu-ray was likely never to have the same impact as DVD, and that digital downloading showed "nice growth."[38] Six years after Chris Anderson discussed the development of the "long tail," by which digital and semi-digital distribution systems facilitated the proliferation and economic feasibility of niche media, there has indeed been a proliferation of new means for the dissemination and consumption of moving images.[39] This has caused as much experimentation as was seen in the early days of home video, as the Hollywood studios and other major content providers assess new techno logical possibilities, such as internet streaming and VOD, and economic models, such as subscription-based access to content. On the one hand, not all of these transformations are positive for the majors. As one Home Entertainment execu tive for a major Hollywood studio stated, "from my perspective, the deals that the Hollywood studios have cut with Netflix on their streaming model I think are some of the single worst business decisions that the studios have ever made in the industry of home entertainment," due to the fact that it keeps people from going out and spending money on new releases.[40] On the other hand, given their established position within the media business as well as their economic power, it does seem inevitable that the major players in media distribution, including the Hollywood studios, Ingram, and VPD, will continue to navigate and shape the way content flows across screens, from Hulu to streaming Netflix, to Pay Per View, to YouTube.

But what does this mean for the eclectic boutique art-cinema distributors like those discussed above? Content-wise, these companies have been part of the "long tail" before such a thing was identified. Facets, in fact, instituted a "long tail" model for bringing their product to market in the days before digital technology, as they have provided a rent-by-mail system through their rental location since 1983. In this way, they served a more geographically dispersed clientele than simply the renters in Chicago, getting art cinema on VHS and DVD to customers without a specialty video store in their vicinity. But these companies are confronting new technological changes as well. Like the Criterion Collection, all three are now making ventures into the Blu-ray DVD market, despite the additional costs and somewhat marginal benefits of this technological change. In this, they are betting on the fact that their established brand identities, which signify cinematic quality, will coordinate with a new industry standard that promises technological quality. And like previous ventures, they release Blu-ray editions based on their DVD track record; Kino is offering films by Buster Keaton (*The General*, 1936,

[38] Ben Fritz, "Sony Pictures' David Bishop: In the Thick of Home Entertainment's Evolution," Los Angeles Times, 18 February 2010, http://articles.latimes.com/2010/feb/18/business/la-fi-ct-facetime18-2010feb1B (accessed 2 May 2010).

[39] Chris Anderson, "The Long Tail," *Wired*, October 2004, http://www.wired.com/wired/archive/12.10/tail.html (accessed 2 May 2010).

[40] Personal interview with anonymous Hollywood executive, 18 March 2010.

and *Steamboat Bill, Jr.*, 1928) and Wong Kar-Wai (*Fallen Angels*, 1995), while Facets is offering a more limited number of titles, taking a "wait and see" approach to new media technologies.

But the real elephant in the room of home video distribution is VOD and internet streaming, and all three of these companies are cautious, even hesitant, in their approaches toward these delivery systems. One possible model for new media art cinema can be seen in the website called Mubi, which was originally called "The Auteurs" in an interesting gesture toward quality. On this website, one can stream any number of both classic art house films as well as more contemporary prestige pictures. The company was formed in 2007 with funding from Goldman Sachs, and it was conceived as an online outlet for "under distributed films." More importantly, the goal was to overcome time-space barriers for people who like art cinema, so that one could watch "*In the Mood For Love* in a cafe in Tokyo on your laptop," for instance.[41] Although the original intent of Mubi was to make such movies available for free, the vast majority of their offerings cost around $3. Unlike other distribution models, including some online firms, Mubi does not ask for any minimum from the rights holders in payment for the service of putting the movie online, and they split the revenue fifty-fifty with the rights holder of any film that gets streamed. Notably, Mubi partnered early on with The Criterion Collection, allowing them to distribute a selection of Criterion films. Criterion even allows the website to stream six of their films for free each month. Kino International has also partnered with Mubi, so one can stream a number of their films as well. These partnerships aim to expand the technological bounds of quality cinema by drawing upon existing cultural wealth, and this could simultaneously consecrate the Mubi website itself as a new site for the production of cultural wealth.

In terms of a practical cultural logic, Mubi exists in the realm of the long tail, but in a significantly different way than something like Netflix. In their own terms, Mubi takes a "strategic approach" by being very selective about titles and only offering a restricted number. Accordingly, Mubi, like Criterion or Zeitgeist, aims to create a sense of value out of exclusivity. This endeavor is tricky on the internet, of course. One worker at Mubi even admits that, in use, the website serves as a tool of discovery rather than a tool of viewing for most visitors; people go there to pre-shop for their DVDs. But, through the social networking and chat forum features on the Mubi website, they also allow for interactions around media that are not immediately reduced to commercial transactions. In this way, the website distributes both movies as well as a discourse around them; given their infrastructure, Mubi may indeed indicate how notions of restricted, exclusive, and prestigious forms of media wealth could circulate more widely. If we are to believe the techno-utopian hype, art cinema—from the art house to your house—will soon be everywhere and nowhere in particular.

Thus we find another instance of the transfer and transformation of quality cinema from one techno-social formation to another, and with it another moment of danger for the cultural industries. Mubi, like Facets, Kino, and Zeitgeist before them, demonstrates how, in the realm of cultural production, the distribution of wealth necessarily intertwines with distribution as a process of exchange and commodity circulation. Although in classical Marxist critical political economy the circulation of capital has as its objective the realization of surplus value, the apparent generation of money from money, "circulation" in the cultural

[41] "About," *Mubi.com*, http://mubi.com/about (accessed 12 August 2010).

realm necessarily involves *ideas* of value, values about value. And these values are not stationary either; the circulation of cultural commodities does not merely put into motion money and objects, but also competencies, tastes, and practices of use. These all must circulate as well. For their part, Kino, Facets, and Zeitgeist all distributed quality as a quality and helped cinephiles feel at home at home.

Acknowledgements

This essay would not have been possible without the help and input of a number of people. My research assistant Jacob Mendel inspired the essay and conducted most of the interviews for it; his research was supported by funding through the Undergraduate Research Opportunity Program at the University of Michigan. Likewise, Peter Alilunas conducted interviews and research that was vital; his research assistance was supported by a Spring/Summer Research Grant through the Horace H. Rackham School of Graduate Studies at the University of Michigan. Manishita Dass, Sheila Murphy, and Aswin Punathambekar read multiple versions of this essay and gave great suggestions. Finally, I wish to thank the many interview subjects working in the media industry, both named and anonymous, who were generous with their time and insights.

CHAPTER 22

SoundCloud and Bandcamp as Alternative Music Platforms

David Hesmondhalgh, Ellis Jones, and Andreas Rauh

Social Media + Society 5, no. 4 (2019): 2056305119883429.
https://doi.org/10.1177/2056305119883429.

Abstract

We examine two "producer-oriented" audio distribution platforms, SoundCloud and Bandcamp, which have been important repositories for the hopes of musicians, commentators, and audiences that digital technologies and cultural platforms might promote democratization of the cultural industries, and we compare their achievements and limitations in this respect. We show that the emancipatory elements enshrined in SoundCloud's bottom-up abundance are compromised by two elements that underpin the platform: the problematic "culture of connectivity" of the social media systems to which it must remain integrally linked and the systems of intellectual property that the firm has been increasingly compelled to enforce. By contrast, it seems that Bandcamp has been relatively stable in financial terms while being at odds with some key aspects of "platformization," and we explore the possibility that some of the platform's apparent success may derive from how its key features makes it attractive to indie musicians and fans drawn to an independent ethos. Nevertheless, we argue that even while in some respects Bandcamp acts more effectively as a cultural alternative than does SoundCloud, Bandcamp is also congruent economically and discursively with how platforms capitalize on the activity of self-managing, self-auditing, specialist, worker-users.

Context and Approach

In this article, we examine two music platforms that over the past decade have been important repositories for the hopes of musicians, commentators, and audiences that digital technologies might achieve democratization of the cultural industries: SoundCloud and Bandcamp.

The significance of these platforms can only be established by placing them in the context of the broader development of platforms in the world of recorded music. Recorded music was the first major cultural industry to be transformed by online platforms. The practices and working lives of many musicians, not just established names, have been fundamentally altered by the rise of music streaming and social media (Baym, 2018; Haynes & Marshall, 2018). The use of music streaming services by consumers has grown rapidly in recent years, and all serious analysts now see them as central to the economics of the recorded music industry over the coming years. A small group of specialist music streaming services has become dominant, notably Apple Music, Spotify, and in the vast Chinese market, those offered by Tencent. The attraction of such services is the instant availability for consumers of huge catalogs of professionally produced music, either for free, with adverts interrupting the music, or for a monthly subscription fee, which as well as avoiding adverts, allows offline consumption of tracks saved to devices such as laptops and mobile phones. The services provide access to many thousands of playlists, based on artists, genres, and moods, some produced by algorithm and some by professional editors (they also allow for the creation and sharing of playlists by users). These platforms are the formalized inheritors of the well-funded but "extra-legal" (Nordstrom, 2007) peer-to-peer "pirate" services that sprung up in the first Internet boom of the late 1990s and early 2000s; most famously Napster, eventually closed down as a result of legal action by the "major" music business corporations (Sinnreich, 2014). Some such services or platforms persist but most digital consumption of music worldwide now takes place via the "mainstream" streaming services, in negotiated partnership with rights owners (mainly the majors).

However, there is another set of streaming services or audio distribution platforms which serve a somewhat different purpose, allowing free and easy uploading and labeling of digital files containing music, and seeking to provide a means by which musicians can find audiences without necessarily working alongside major and independent recording and publishing companies. They might therefore be characterized as "producer-oriented" platforms, as opposed to the "consumer-oriented" mainstream platforms. We use the term "producer-oriented" to refer to the fact that, compared with streaming services such as Spotify, they are designed in such a way as to encourage producers of music to upload content though they are also accessed widely by people interested in music who are not musicians, and have no ambition to act as producers. [1]

[1] It is easy for amateur and semi-professional musicians to use YouTube to upload their music. YouTube, because of its extraordinary multiplicity, does not fit easily into our categories of "consumer-oriented" and "producer-oriented" music streaming services.

The first major example of a "legal" producer-oriented web-based service that served as a means to connect musicians and other music producers with music audiences was Myspace, though it was also widely used for social networking among non-musicians. Myspace, established in 2003, rapidly declined in popularity and use as a social network after 2008, displaced largely by Facebook. Although Facebook continues to be widely used by musicians to share music and information, SoundCloud, launched from Berlin in 2008, and Bandcamp, launched in California also in 2008, have been much more significant as channels for musicians to reach audiences in the new musical ecosystem. Arguably, these sites represent the main way in which the hopes of digital optimists regarding new relations of musical production and consumption are embedded in the rapidly emerging "platformized" cultural world.

We begin by analyzing SoundCloud's efforts to create a "bottom up" platform devoted to sharing and connecting through music. We show how certain aspects of the service's interface appeal to electronic dance music and hip-hop musicians and their audiences because, whether consciously or not, they reflect commonplace practices and values in those genres. We also show that the sense of a demotic and interactive abundance that underpins the service is doubly compromised: first, because of the problematic "culture of connectivity" and data-mining that underpin social media and other platforms with social-media features, and second, because it must manage conflicts of interest between its users and rightsholders. SoundCloud, we explain, has failed to find stable ways of monetizing the rich mix of musics that make the site so attractive to its users. Seeking to respond to this failure, it has been forced to accept terms and conditions from the established mainstream music industries that seriously damage its claims to be distinct from, and alternative to, the mainstream consumer-oriented streaming platforms, particularly regarding the enforcement of intellectual property.

Bandcamp provides a revealing comparison. While it is not completely clear how well or badly Bandcamp performs in economic terms (see below), there have been no reports of financial difficulties. This seeming success may partly be explained by the facts that it operates with a small number of staff and does not need to make licensing agreements with key rightsholders to encourage use. Another possible factor, we suggest, is that its (partial) resistance to "platform" characteristics makes it attractive to musicians drawn to an "alternative" or independent ethos. Bandcamp, in other words, may be a successful alternative platform partly because, in significant respects, it is less like a platform than other key music services. Nevertheless, in some interesting ways, it is also congruent economically and discursively with how platforms capitalize on the activity of self-managing, self-auditing, specialist, worker-users.

To make the above arguments, we analyze the distinctive technological, political-economic, and business forms of these two platforms. Like other analysts of cultural platforms, we seek to draw upon insights from software studies, political economy of culture, and business studies (cf. Nieborg & Poell, 2018). However, our approach to the issue of the platformization of cultural production is distinctive. First, although we scrutinize the degree to which these platforms are influenced by understandings and practices associated with Big Tech, our focus on "alternative" sites such as SoundCloud and Bandcamp means extending the political-economic and socio-technical analysis of cultural platforms beyond those of the GAFAM oligopoly that dominates so much public and academic commentary on platforms and

platformization.[2] Second, we analyze how audio distribution platforms such as SoundCloud are associated with the "alternative" and "independent" cultures that have been so important to popular music over many decades. "Alternative" is a term widely used to refer to forms of culture, and forms of cultural production, that stand outside, or in opposition to, some kind of "mainstream," especially those associated with business corporations or the state (*Downing, 2000*), and that therefore in some way differ from, or challenge, conventional norms. In some cases, this involves nonprofit and cooperative forms of governance, in some it involves petty capitalism (*Mutibwa, 2015*). The notion of the musical "alternative" is strongly tied to "independent" or noncorporate and nonstate cultural institutions, especially record labels, distributors, and shops, and with a special focus on achieving greater degrees of collective autonomy and control for groupings of musicians, audiences, and others (*see Hesmondhalgh & Meier, 2015; Kruse, 2003*). Focusing on alterity and independence therefore requires attention to aesthetic, textual, and cultural values and practices, as well as to political economy, business practices, and software affordances. To assist with this analytical task, we also draw upon interviews conducted with musicians from various genres.

Such a focus on alterity and independence also demands consideration of the musical genre formations that are essential to understanding the meanings of music in modern societies (Brackett, 2016; Lena, 2012). We show how and why "producer-oriented" audio distribution platforms become associated with particular musical genres—Bandcamp with certain kinds of "indie" music, and SoundCloud with electronic dance music and certain subgenres of hip hop. This in turn allows us to place analysis of such platforms in the context of longer histories of efforts to create genre-based alternative business models for the production and circulation of culture in the name of democratization (Hesmondhalgh, 1998), thus deepening the historical field, and avoiding an emergent tendency in research and scholarship to see the onset of platforms as a totally new beginning for the cultural industries.

SoundCloud

The original aim of SoundCloud was to provide, in the words of its founders, "something that would enable artists to share and connect through music" (Ljung, 2017). It grew quickly in 2010 and 2011 to become the main way in which amateur and semi-professional musicians share music with potential audiences. SoundCloud is available and used across much of the world (Allington, Dueck, & Jordanous, 2015) and has a "highly shareable, highly social" (Mulligan, 2017) user interface, which easily links to mainstream social media such as Facebook, Twitter, Instagram, and Snapchat. It incorporates many of the hallmark features of social media platforms, allowing for the following of other users, the reposting of tracks posted by other users (akin to Twitter retweets or Facebook sharing of posts), and the liking of tracks. As with social media, metrics are clearly and visibly displayed (e.g., number of followers, plays, likes, reposts), fostering user interaction, but often involving competitiveness and hierarchies of

[2] The widely used acronym GAFAM refers to five large tech corporations with massive global reach: Google, Apple, Facebook, Amazon, and Microsoft. Three of these firms (Google, Apple, and Amazon) own and operate popular consumer-oriented (as opposed to producer-oriented—see above) music platforms. Other popular and well-funded services such as Spotify and Deezer are not run by these major tech corporations, and so are "independent" in this (limited) respect, but they are likely to be vulnerable to takeover by the bigger companies.

users. Registered users of SoundCloud can upload audio content up to a limit of 2 hours for free, more if they pay subscription fees, and unlimited for "premium" subscribers.

For professional musicians, SoundCloud provides a sense of "a direct connection with fans unlike standard streaming services" (Mulligan, 2017). For emerging musicians aspiring to greater success, it offers "a global platform for reaching fans with no intermediary" (Mulligan, 2017). Like YouTube, SoundCloud engages millions of users who have no ambition to achieve professional success as content creators. But also like YouTube, the appeal of SoundCloud has been stimulated by stories of the platform's role in enabling ordinary users to achieve success and fame.[3] Still, the platform's ability to pave the way for success is often misunderstood, misrepresented, and mythologized. Perhaps the most widely cited case of a rise to musical fame via SoundCloud (e.g., Sisario, 2014) is the New Zealand artist Lorde, unknown when she posted her track "Royals" in October 2012, and an international superstar just a year later. Similar stories later surrounded the emergence of Billie Eilish as a global star (Duboff, 2019). As with stories about YouTube celebrity and Myspace stardom, the truth is often more complex. In fact, as Haynes and Marshall (2018, p. 1979) point out, Lorde had signed with Universal, the world's largest record label, 3 years before "self-releasing" "Royals" (see also Bertoni, 2013). What is more, even on producer-oriented cultural platforms, only a small number of users post their own music—around just 3% to 4% of consumers post music and/ or video to SoundCloud or YouTube according to one source (Mulligan, 2017). Nevertheless, as a result of its mix of amateur, professional, and semi-professional content, SoundCloud has an extraordinarily large and diverse catalog of music and other sound files, over 170 million tracks by 2017 (Lovejoy, 2017), far more than the roughly 40 million tracks available on Spotify (Nicolaou, 2018). In the words of one enthusiast, "it's music interaction and discovery distilled to its purest form, home to just as many famous artists as ones that will be soon" (Horn, 2014).

SoundCloud includes music, speech, and sound across many different genres, but it is particularly well known for electronic dance music (EDM), and hip hop (Allington et al., 2015; Caramanica, 2017). Some key values associated with EDM, and to a certain extent hip hop, are incorporated into SoundCloud's design and interface.[4] In particular, SoundCloud enshrines a sense of vernacular abundance which appeals to musicians and fans drawn to those genres. Core audiences of EDM and hip hop (including amateur and semi-professional musicians) have historically placed great value on the genres' ability to produce and sustain an ever-changing abundance of grassroots creativity. In the case of EDM, this has led to a relative emphasis on anonymity, manifested in the frequent use of multiple aliases by producers, and the downplaying of performers' visual images (Hesmondhalgh, 1998). The abundance

[3] Some commentators and users see much stronger parallels between SoundCloud and the video-sharing site Vimeo, than between SoundCloud and YouTube, on the basis that Vimeo does not carry adverts, allows for better audiovisual quality, and arguably contributes to a stronger sense of community among creators and users. When SoundCloud reorganized in 2017 in the wake of new investment, its new CEO and other senior executives came from Vimeo. The aim appeared to be to focus on monetizing the attachment of creators to the site, as Vimeo successfully had. See Kirn (2017).

[4] Some commentators have used the term "SoundCloud rap" to describe hip hop disseminated on SoundCloud and characterized by "lo-fi" and "distorted DIY production" (Scheinberg, 2017). At the time of writing, such tracks are by far the most popular form of music on SoundCloud. In this article, we focus more on electronic dance music (EDM), partly for reasons of space, and partly because some of the research on which this article is based was focused on that genre (Rauh, 2018).

has partly been made possible by use of low-cost digital technologies, including "bedroom" production on laptops, often based on sampling, remixing, mashups, and so on (see Rauh,

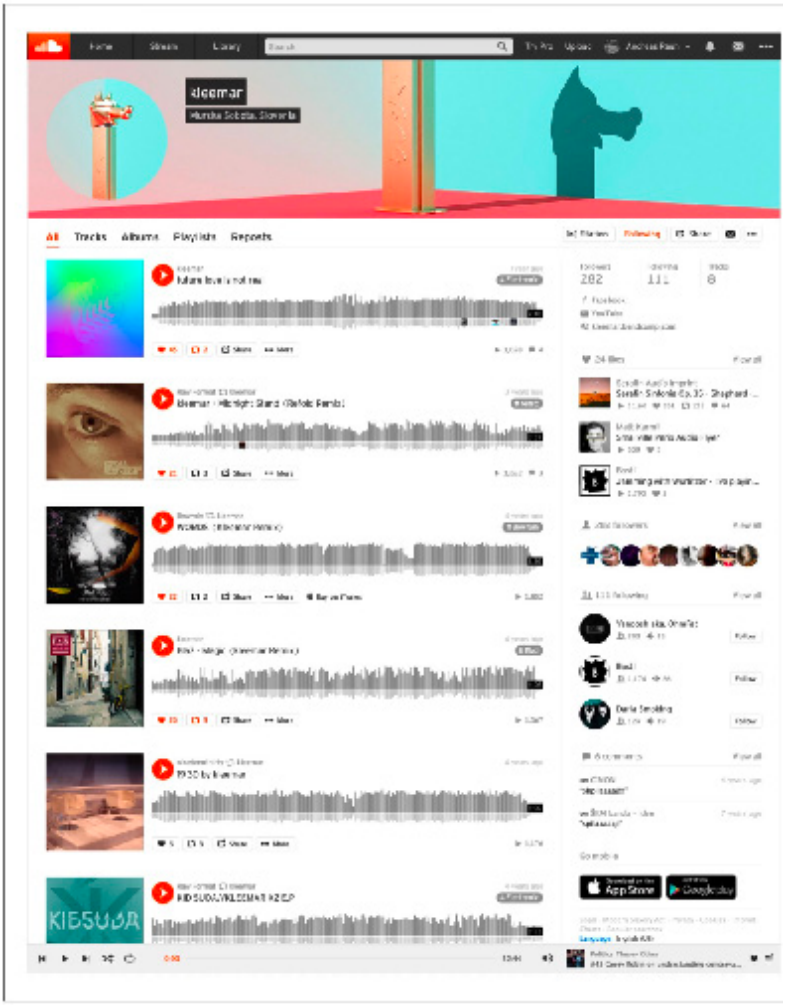

Figure 1. Detail from a profile page from SoundCloud, showing the lack of emphasis given to performer identity. (Screenshot of https://soundcloud.com/kleemar, accessed 24 April 2019, used with permission.)

2018).[5] Compared with other genres, such as jazz, rock, and indie, there is comparatively less focus on stable canons of revered historical figures, and great value is placed on the dynamism and ephemerality of the music and associated forms of sociality (Straw, 1991).

The de-emphasizing of performer identity is apparent in SoundCloud's design, in particular the visual prominence of music represented as a waveform (see Figure 1), but also in the way that amateur and semi-professional musicians are, at least in terms of presentation, given nominally equal billing with established and emerging professionals. As Figure 1 shows, musicians' profiles coexist in the same digital space. The waveform draws from practices in digital music (re)production, and in SoundCloud reflects conventions adopted by EDM and

[5] EDM and hip hop of course have star systems based on celebrity musicians and DJs, but this feature of the cultural industries is in constant tension with the high value placed on anonymity (Hesmondhalgh, 1998).

hip-hop communities. In those genre worlds, DJs have long relied on visual references to cue and mix tracks, latterly as waveforms displayed on the screens of digital turntables and laptops. Using audio software (digital audio workstations [DAWs] and virtual studio technology [VSTs]), music producers create tracks by manipulating loops and other audio content displayed as waveforms in the screens of computers. Moreover, the waveform symbolizes an engagement with computer-based music technologies, and such symbolism in itself is attractive to the technology-oriented users who are often drawn to EDM and hip-hop—musicians in these genres are "deeply invested in technology" (Farrugia & Swiss, 2005, p. 30) and dance music cultures were early adopters of online platforms for music distribution (Allington et al., 2015; Mjos, 2013). These musicians are largely enthusiastic, and at times utopian about new technologies, though critical dystopian views are also apparent.

Importantly, the waveform in SoundCloud is also a primary focus of social interaction because the platform allows registered users to post comments directly on it. These comments are timestamped, and are often used to convey information about sections in a track (or DJ mix) that have important meanings in EDM culture, such as *the drop* (when the bass line and kick drum (re-)enter the mix following an anticipatory build) (see Figure 2) or *the hook* in hip hop. In this way, SoundCloud embodies into its design distinctive forms of genre-specific interactivity, by allowing users to post comments on particular moments in tracks uploaded by amateur and professional musicians. Listeners can also interact with each other through the comments posted along the waveform. For amateurs and beginners, this interaction is often a valuable source of feedback (whether encouraging or discouraging; Rauh, 2018), and

Figure 2. Detail from a profile page from SoundCloud, showing the waveform and timestamped comments. (Screenshot of https://soundcloud.com/tahira/raca-tahira-rework, accessed 10th December 2018).

for professional musicians and their fans, it can enable a greater sense of "mediated intimacy" (Baym, 2018) and community, in ways not dissimilar to threads of discussion on a musician's Twitter feed.

In these various ways, SoundCloud involves a much greater sense of vernacular interactivity and reciprocity than the mainstream consumer-oriented platforms such as Spotify and Apple Music, and there are strong echoes of the hectic and tumultuous diversity of the peer-to-peer sites that have long been popular among EDM, hip hop, and other audiences, but that have become increasingly marginal as digital music has become integrated in consumer-oriented platforms.

However, SoundCloud's demotic, interactive, and apparently democratic abundance is compromised. Even as it seeks to convey an aura of peer-to-peer multiplicity, underpinning the platform's interactivity is social media's problematic "culture of connectivity," involving "a continuous pressure—both from peers and from technologies—to expand through competition and gain power through strategic alliances" (van Dijck, 2013, p. 21). That culture of connectivity also includes monitoring users' behavior and gathering data about music consumption, potentially available to third parties via Application Programming Interfaces (APIs); and, like other platforms based on "user-generated content," their business model depends on what can be characterized as the "free" or unpaid labor of users.[6] SoundCloud's rhetoric of sharing and connecting through music remains embedded in the political economy and culture of digital networks under capitalism, and various contradictions result from it.

This is clear when considering SoundCloud's history, and the platform's struggles to build a business model based on UGC and social media interaction. As is typical for a tech company seeking to establish itself as the main provider of a certain kind of service, SoundCloud has sustained considerable losses in the hope of achieving very large profits later, once it has established itself as the dominant platform within its particular market by matching high numbers of providers (and their content) with high numbers of users (and data about consumption practices; see below for more discussion of this multisided aspect of platforms). But the platform has proven unable to monetize the vast amounts of freely given content, which is largely obscure and/or unauthorized, thus leaving it at a disadvantage in a market dominated by consumer-oriented platforms such as Spotify and Apple Music. SoundCloud's capacity to earn revenue from the sales of targeted advertising is also limited because the platform does not have demographic (meta)data information associated with individual user behavior (Allington et al., 2015).

The problems facing SoundCloud demonstrate the continuing difficulties that capitalist businesses face in generating revenue from music-related online activity, even as they transform the ways in which music is distributed and consumed (Hesmondhalgh & Meier, 2018). By 2014, SoundCloud had "raised more than $100 million in venture financing from blue-chip investors" (Sisario, 2014) claiming 175 million regular users and valued itself at as much as US$700 million, as firms such as Twitter and Spotify showed interest in purchasing the company. In spite of its rather dubious claims to attract such high numbers of users, however, SoundCloud's revenues were "miniscule" up to 2014, and were derived almost entirely from "the fees it charges some of its most active providers" for storage space and data analysis (Sisario, 2014). For this reason, in 2014, SoundCloud began to sign deals with major music publishers, distributors, and artists so that they could attract advertising, and in 2016 began to offer a consumer-oriented subscription service along the lines of those run by

[6] There is no space to discuss the concept of "free" or unpaid labor here. See Hesmondhalgh (2015), for discussion of problems concerning the concept, including its relations to ideas of exploitation.

Spotify, Apple, and Tidal, entitling subscribers to advert-free music as well as offline access. It also sought and obtained further investment from its backers, but by 2017 SoundCloud was in serious trouble, making considerable losses, and attracting only 100,000 new consumer subscriptions. It laid off hundreds of workers in 2017, closing its San Francisco and London offices and, under a new Chief Executive, abandoned its efforts to compete with the major subscription platforms, and refocused towards catering to content producers, on the basis of selling "tools" (mainly data on user behavior and extra storage) to musicians for between US$70 and US$100 per year (Nicolaou, 2018). SoundCloud then seemed to recover, raising yet more investment in anticipation of a bid from a bigger rival such as Spotify (Nicolaou, 2018). Yet there is still skepticism from music industry commentators about its efforts to "reposition itself as a creator- first community" (Deahl & Patel, 2018). SoundCloud's future remains uncertain (Sanchez, 2018).

As a result of these developments, while SoundCloud maintains a reputation as a place where musicians—perhaps especially hip-hop musicians (Caramanica, 2017)—can go from obscurity to success and fame, thereby presenting itself as a "bottom up" challenge to the music industry, it has not been able to bypass the systems of intellectual property that underpin the music industries, and this has come to constrain its appeal to independent musicians. This is evident in SoundCloud's changing policies on "takedown" notices. For years, the company did little to police copyright infringements, claiming that as a platform it was protected by the US Digital Millennium Copyright Act of 1998, notably the "safe harbour" principle which determines that online intermediaries (whether "platforms" or Internet service providers) cannot be held responsible for user-generated content that infringes copyright.[7] However, as SoundCloud struck deals with major recorded-music companies (Universal, Warner, and Sony), it was compelled to take a far stricter stance with regard to unauthorized use of copyrighted material. It increased the number of takedown notices it issued and increased deletion of profiles of recurring offenders. To make matters worse, its content ID algorithm often seems to be inaccurate, leading to unjustified takedowns. While users can appeal, the process is opaque, increasing levels of anxiety and uncertainty among musicians (Rauh, 2018). This scenario places some users at great risk of having their profiles deleted, as is evident in the case of DJs who upload mixes and sets featuring unauthorized third-party content. Many DJs have migrated to other producer-oriented platforms (Rauh, 2018), such as Mixcloud, partly because the latter service is not so enthusiastic in enforcing takedown notices (O'Hear, 2018).

SoundCloud, then, faces a major problem: its most valuable asset is uploaded content made by those the company refers to as *core creators*, yet it must reinforce stricter copyright enforcement policies, because of its lack of power vis-a-vis the major record companies. In this respect, it is in a much more vulnerable position than YouTube, which, backed by its mighty Alphabet parent company, can approach infringement issues from a more powerful position. Having said all this, in SoundCloud's favor is the need of the recorded-music companies for a variety of online outlets for licensed music, so that outside China and India the mainstream consumer-oriented streaming services do not form into an oligopoly, or even a duopoly run by, say, Apple and Spotify, as is highly feasible. Moreover, the music industries as a whole rely on a constant influx of new talent and cultural products, and SoundCloud offers

[7] A similar principle was incorporated into European law in the form of Article 14 of the E-Commerce Directive of 2000.

a relatively inexpensive environment where musicians can experiment musically (which in EDM and hip hop rely on sampling and remixing) and build up followers and fans. Yet, current copyright enforcement policies on SoundCloud work against the common view among many EDM and hip-hop musicians of "fair use"; that is, as long as the authorship of sampled material is acknowledged and no negative impacts are incurred to the original artist (loss of revenue or reputation damage), there is a valid case for using copyrighted material without authorization. A different view prevails in the mainstream music industries, one with which SoundCloud is now forced to comply.

SoundCloud, then, is a remarkable cultural phenomenon, but its struggles suggest limits to hopes that a producer-oriented platform of this kind might be the basis of any significant democratization of musical production and consumption. Bandcamp provides an interesting comparison, precisely because its relative success seems to be based on ways in which it foregoes features of "platforms," at least in some understandings of that term.

Bandcamp

Bandcamp is a music sales website founded in 2008 by Ethan Diamond and Shawn Grunberger, developers with a successful track record in Silicon Valley (their webmail service Oddpost was bought by Yahoo! in 2004 for a reported US$30 million). While it launched in the same period as Facebook and Twitter, and comparable music-oriented platforms such as SoundCloud and Spotify, it has not grown at the rate of these former peers, and nor has it changed so substantially. It has also not taken the leap into market flotation enacted by these other larger platforms (SoundCloud being an exception at present, though not for the want of trying). Bandcamp received venture capital funding in 2010, from Brad Garlinghouse and True Ventures, but such financing does not seem to have substantially impinged on a stable business model that has been "profitable since 2012" (Bandcamp, n.d.-a). Although it has of late made some concessions to the rise of streaming (purchased releases can now be streamed through the Bandcamp mobile app), it is distinct from other major music platforms in that it primarily offers artists a digital storefront for sales of digital files, physical releases, and merchandise.

It is this distinctiveness we examine here, in the context of platformization. Bandcamp does define itself, in corporate filings to the State of California, as a "music platform" (Bandcamp, 2013), but in its more public-facing discourse, as well as through its interface and its business model, it operates in ways that seem deliberately counter to the approach of dominant music streaming services. This makes it an intriguing case of a potentially "alternative" music platform.

Economically speaking, Bandcamp is at odds with a key aspect of "platformization," namely, that it "brings about a shift from single- and two-sided markets to complex multi-sided markets" (Nieborg & Poell, 2018, p. 428). Whether Bandcamp is one-sided or two-sided is a difficult question—economists generally agree that "sidedness" is a matter of "degrees" rather than an either/or distinction (see Filistrucchi, 2010, pp. 4–5)—but what is more pertinent is that its status as a "transaction platform" (as opposed to a "non-transaction platform") means that, across however many sides, Bandcamp is operating within one *single market system*: that of digital and physical music commodities.[8] It does not meaningfully engage in the "stacking"

[8] The key distinction here concerns the "neutrality" of the price structure; that is, the irrelevance of whether it

of markets so commonly associated with platforms. (The fact that Bandcamp offers musicians and consumers distinct "products" is not relevant here.[9])

Going by the quite specific technical definitions offered in some strands of "platform studies" (Bogost & Montfort, 2009), Bandcamp would fail to constitute a platform on the basis that it is neither programmable nor modular. Most notably, its API offerings are minimal, allowing users to access their own sales data and merchandise orders, but offering no real opportunities to work "with" the data (e.g., by connecting audience metrics to other datasets). Gillespie (2017) argues that it is "too late" to base the definition of "platform" on these technological criteria (i.e., the public understanding of the term has moved on), but it is notable that in its use of this basic, "level 1" API (Andreessen, 2007), Bandcamp strongly resembles older iterations of content distribution sites. And going by Gillespie's rather more socio-cultural definition, Bandcamp still lacks some degree of "platform-ness"; its recommendations system seems to be entirely editorial rather than algorithmic, and the site lacks the "culture of connectivity" that van Dijck (2013) notes is a hallmark of social media. It also has no advertising of any sort, and while this does not directly relate to its status as a platform—there are plenty of online platforms that operate without ads (see Scholz, 2016)—it does put Bandcamp in sharp contrast to the dominant online music (and media) streaming services, and also to the contemporary Internet as a whole.

In economic, technological, and socio-cultural terms, then, Bandcamp perhaps offers something akin to a "quasi-platform"; a static, Web 2.0-esque distribution service whose functionality has been rapidly outflanked by its former cohorts. And yet, as it enters its second decade, Bandcamp must be considered a relative success among a field littered with might-have-beens—if not quite a tech "unicorn," then at least a very sturdy workhorse (at the time of writing, Bandcamp mediates music sales totalling around US$7 million per month, 10%–15% of which goes directly to the site). Why has Bandcamp not gone the way of, say, Myspace, a music-focused site whose decline has been attributed to the lack of an expansive API (Helmond, 2015, p. 7)—essentially, a failure to "platformize"?

The answer is partly that Bandcamp offers capacities that hold specific value to the indie music practitioners who form its core user-base, and that these capacities relate directly to its "quasi-platform" status. A significant consequence of the lack of connectivity mentioned above is that artist pages are discrete entities—lacking, for instance, the autoplay function of SoundCloud that takes listeners from one artist to the next when a track is over. Releases on Bandcamp seem more fully "situated" than on streaming services, allowing for the creation of the "excess of symbolic meaning" that Barry Shank (1994) has argued is a key characteristic of local music scenes, such as the one he studied in Austin, Texas, in the 1980s (p. 122). One interviewed practitioner suggested that "it feels like when you go on a Bandcamp page, you can concentrate on what it is more. If it's a release, an album or EP or whatever, it feels more

is the buyer or seller who pays the platform. This is sometimes referred to as "pass through," since one side of the market is able to pass through its interaction costs to the other side (Filistrucchi, Geradin, van Damme, & Affeldt, 2014, p. 299). Rochet and Tirole draw on the example that "for a given level of VAT, it does not matter who, of the merchant and the consumer, is charged for it" (p. 648). Bandcamp's per-transaction fee is this kind of "neutral" exchange, and is quite distinct from a platform having to set a price structure that works for, say, advertisers, rightsholders, and consumers who do not directly transact with one another.

[9] To use Filistrucchi et al.'s (2014) example, a rental agency dealing with landlords and tenants operates in a single market, despite the fact that the products offered to each side are different: "a landlord trying to rent a flat would not usually be interested in visiting flats that are up for rental" (p. 303).

conceptually there, in the closest way possible I think to a physical release." One band observed that SoundCloud was for "viral streaming of individual tracks," whereas "with Bandcamp it's more like you make your own little space on the Internet"; another argued that "if Bandcamp is the full thing, the twelve-inch [album], then SoundCloud is the seven-inch [single]."[10] There are links to rock discourses of value here—the album as the nourishing meal, the single as calorific snack (Keightley, 2001, 2004)—but also to indie-specific values of materiality (physical productivity as the valorized "doing" in "do it yourself"), and insularity (the "do-it-yourself" [DIY] scene as something to be shielded and protected; see earlier citations, and Jones, 2018). It makes sense, then, that practitioners value how Bandcamp allows users their "own little space," rather than chasing the ephemeral (and quite uncontrollable) popularity of virality.

This emphasis on space also intersects with a specific notion of time. Because Bandcamp pages are relatively standalone, there is less fear that releases here will be cast adrift amid an unceasing flow of content. This offers an alternative to the hurried chronology of the "News Feed"—what Kaun and Stiernstedt (2014) call "Facebook time"—and this sense of relative permanence also extends to the overall site design. Bandcamp has a relatively stable and limited set of features, unlike Facebook's reactive approach in which rugs are frequently pulled from beneath users' feet as various components of the platform are redesigned, repurposed, or removed entirely (Bratton, 2015, p. 194). Here, there are notable connections with indie and punk practitioners' historical emphasis on "documentation" as a key aspect of their work (Azerrad, 2001, p. 132); the phrase "making a record" neatly carries this connotation of cultural output as archival work (or "record-keeping"). Bandcamp is a place where recordings feel like they will stick around, contributing to a historical lineage of self-made cultural artifacts—very different from the ephemerality and newness enshrined in SoundCloud, a focus on innovation congruent with some core values of EDM and hip hop.

Nieborg and Poell (2018) argue that platformization has brought about the "contingent" cultural commodity, defined as "malleable, modular in design, and informed by datafied user feedback, open to constant revision and recirculation" (p. 2). Popular music is certainly not immune to these processes—prominent examples include the iterative "albums" of Kanye West and Frank Ocean (Greene, 2016), or the rise of highly data-driven Spotify playlists both algorithmic and editorial (see Bonini & Gandini, this issue). But there are numerous reasons why the kind of "contingency" observed in the news and video game industries might be less readily adopted in music, including popular music's particularly strong emphasis on "authentic" expression (Frith, 1987/2007, p. 136). That larger issue of authenticity is beyond the scope of this article, but at the genre-specific level at least, it is clear that a malleable cultural commodity is ideologically incongruent with indie's emphasis on materiality, permanence, and insularity, and that Bandcamp provides these qualities to a substantially greater extent.

Bandcamp's limited utilization of data may be to some extent a matter of resources (i.e., their small staff may make certain kinds of data work infeasible), but it is at least partly a deliberate choice to offer a non-platformized aesthetic; Bandcamp advisor Andrew Dubber (2013) has used the phrase "behavioural skeuomorphism" to characterize the platform's conscious efforts to make the platform's interface look and feel like an old-fashioned, record-shop experience for consumers. Bandcamp's skeuomorphism also extends to a specific approach to metrics.

[10] The interview material utilized here is drawn from ethnographic research focused on the do-it-yourself (DIY) indie-punk scene in Leeds, conducted during 2015–2018 (see Jones, 2018).

While a few now-conventional metrics of a kind associated with social media platforms are available to Bandcamp page owners (plays, sales, and "buzz," with additional location details available to paying "Pro" subscribers), there is no public metric that is directly equivalent to "likes" or "followers." Perhaps the most important measurement on the site—the number of people who have purchased a release—is not given publicly in numerical form, but is instead represented pictorially, in the form of a collection of avatars of "fans" who have supported the artist (see Figure 3).

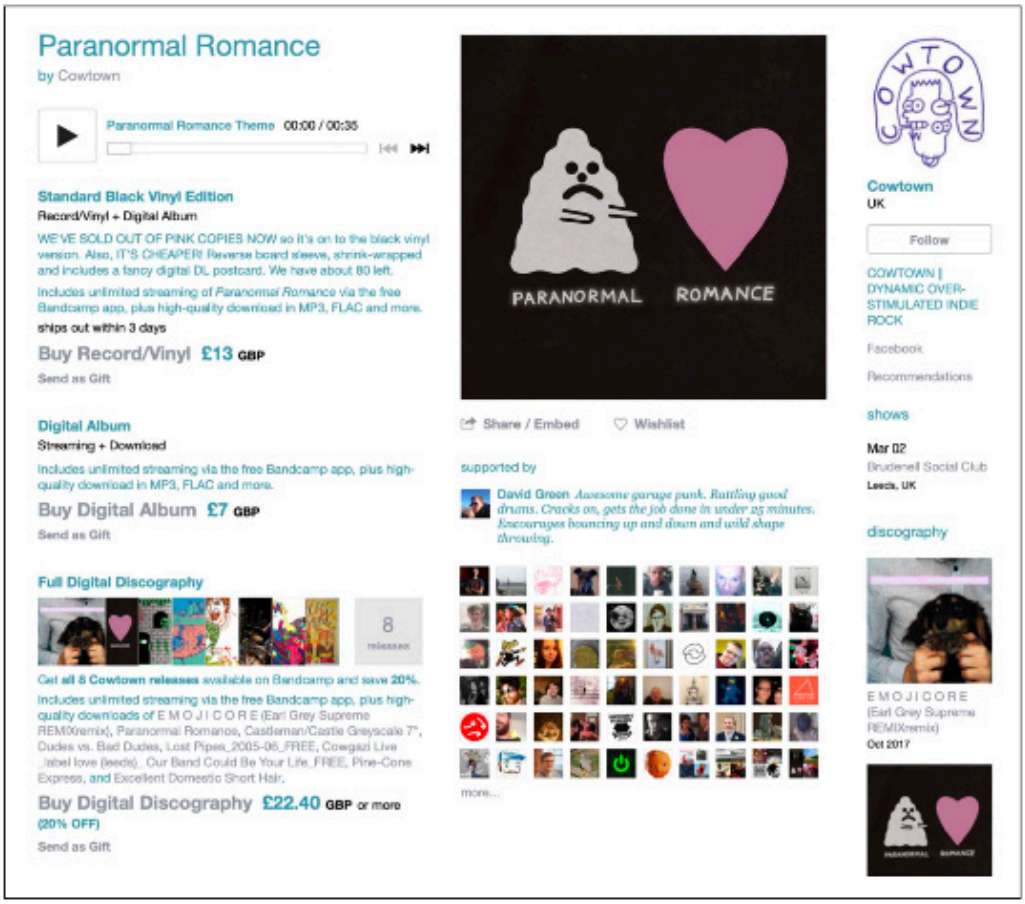

Figure 3. Detail from an Artist page on Bandcamp, showing a crowd of "fans," and any qualitative feedback left by them, beneath the album art. (Screenshot of http://cowtown.bandcamp.com, accessed 17th December 2018.)

Again, this approach is consistent with the ethical and aesthetic sensibilities of the indie musicians who populate the platform. These practitioners report finding conventional metrics at best "vaguely interesting" or "irrelevant," and at worst a source of anxiety and unwelcome comparison with other, bigger acts. The irrelevance of metrics here relates to the specific structure of small indie scenes (highly focused on the local), and also a not-for-profit ethos, which combine here to mean that the numbers are simply not that valuable (Jones, 2018). There is a strong desire to "translate" metrics back (*a la* Bolin & Andersson Schwarz, 2015),

to see their audience not as the instrumentalized connective "edges" of a social network, but as individuals with which to form communicative bonds. On Facebook Pages this means "clicking through" past their total number of likes to find meaningful relations to the local, material practice that still constitutes the primary "site" of their scene: "that's quite nice to be like, hey, I remember I saw that person last night, they've now come and found us [. . .] I like getting new Likes because you can relate it to those moments." Bandcamp's pictorial representation of fans—the opposite of the "faceless" numbers on mainstream platforms—makes it easier to locate meaning, creating a crowd scene out of individually discernible users, and thereby emphasizing the direct, intimate connection that indie musicians tend to valorize (Nguyen, 2012). This is not to say that feelings of competitiveness and status-seeking are eradicated—it isn't hard to approximately "add up" the number of avatars on display—but there is a clear affinity between Bandcamp and indie music here.

Bandcamp has, like SoundCloud, made some effort to bring the recorded music industry on-board, but this has been aimed primarily at larger indie labels, and therefore does not interfere with core platform dynamics in the same way as SoundCloud's contentious implementation of "content ID." The Bandcamp "Labels" tool, for example, which allows for an overview of multiple artist accounts, is utilized by large indies such as Merge and Sub Pop but is also organizationally beneficial for smaller scale "bedroom" labels. The platform's most recent "expansions," if they can be labeled as such, have included opening a bricks-and- mortar record store in Oakland, California, and collaborating with a record manufacturer to offer a "vinyl pressing service" to artists. These developments may hint toward aspirations of vertical integration, but the "old-school" focus on vinyl and record shops also emphasizes their positioning as music intermediaries rather than technologists, and this operates in tandem with their discursive emphasis on what we might call a "music ecology"—of which they declare the "streaming giants" to be the enemy (Bandcamp, 2018). Bandcamp argues that, "[s]ince we only make money when artists make a lot more money, our interests remain aligned with those of the community we serve" (Bandcamp, n.d.-a).

Such an approach perhaps points to the limited scope of current perspectives on platforms from economics. The starting assumption of the two-sided market theory is that platforms connect actors from different markets who have no interest in each others' welfare (Rochet & Tirole, 2006, p. 646). Newspapers connect audiences and advertisers but, to use Filistrucchi's (2010) neat example, "it would surprise the news agent if you also asked, in addition to the price of the newspaper, the price of an advertising slot in the newspaper" (p. 4). In this framing, the cross-side network effects generated by platforms are a kind of accidental fallout of individuals acting out of self-interest. Bandcamp's business model is less about generating sufficient critical mass to generate such "accidental" effects, and more about making the case for a moral economy in which consumers *deliberately* treat musicians' livelihoods as their own concern.

There are some significant ways, then, in which Bandcamp might justifiably be understood as an "alternative" to the platformization of culture—although, as we will now show, the relationship is somewhat more complex. And the platform's discourse emphasizes this alterity by, for example, positioning their relative reticence to utilize data as an ideological stance, rather than a matter of insufficient resources, as in this introductory section on a Bandcamp "Help" page concerning download pricing:

> Please take what we're about to tell you with a grain of salt. Part of what makes Bandcamp *Bandcamp* is that you, not some corporate behemoth, set your own pricing. And that's really as it should be, since the most effective price just isn't the same for every artist, and you know your fans better than anyone. That said, we have the advantage of a metric crap-ton of data, and that data tells us a few things: [. . .]. (Bandcamp, n.d.-b)

The informal and self-aware tone taken here by Bandcamp (e.g., the semi-ironic description of the platform as a "corporate behemoth") seemingly anticipates some degree of skepticism from their "alternative"-minded artists, and seeks to negotiate between practitioners' localized, qualitative understanding ("you know your fans") and the kinds of analysis in which platforms specialize (built on "a metric crap-ton of data"). Arguably, this "in-between" position reflects an ideological compromise of the platform that does not seek to be a platform. But, at the same time, this kind of hands-off liberalism is a fundamental platform logic, which reflects that fact that platforms have nothing invested in any single sellers' success or failure. In these ambivalent negotiations with and presentations of data, then, Bandcamp remains compatible with a kind of anti-managerial autonomy valued by indie practitioners.

While this compatibility is partially a consequence of Bandcamp's specific status as an alternative, advert-free quasi-platform, it also demonstrates a quite striking congruity between indie music ethics and platform logics. The aforementioned emphasis on autonomy is one crucial overlap—platforms, unlike labels, won't change your image, or force you back into the studio to record a more commercial track—but there is further affinity in platforms' and indie practitioners' shared interest in bypassing traditional cultural gatekeepers, and in encouraging participation from amateurs (the "anyone can do it" ethos of punk, which on platforms is sometimes considered in terms of the "prosumer"). Where once indie and DIY had a fairly stable and unambiguous antagonist, then, in the shape of major record labels (and their stranglehold on access to TV, radio, and the music press), the newly dominant platforms are regarded far more ambivalently.

This ambivalence means that tensions between platforms and indie (and its sense of itself as valuably alternative) are likely to be subtle, often arising in the form of potentially pernicious elisions between the two sets of ideologies at play. For instance, to return to the Bandcamp "Help" page quoted above, what is being sought is not a rejection of datafication in general, but the "most effective price." Similarly, the reason they give for encouraging "pay what you want" is not premised on this being a more egalitarian approach but on the data-supported assertion that people will, on average, end up paying more. The specific ethical frameworks of indie here are not adhered to for their own sake, but because they work as a specific form of granularity to be instrumentalized for the maximum return. In this context, Bandcamp's assertion that "you know best" is perhaps the very essence of what is unique to platform economics: the autonomous activity of a legion of self-managing, self-auditing, specialist, workers, mediated by a host platform that capitalizes upon the effect this individualized labor has in perpetuating and accelerating an internal, multisided market.

As this section has outlined, one key concern of indie musicians in the platform age is that their distinctive sense of alterity might be rendered *indistinct* amidst a torrent of content from newly platform-enabled creators. Bandcamp mitigates this concern particularly well, by anachronistically ensuring that musical content and its context constitute its "raw material" (Srnicek, 2017, pp. 54–58), and not data. Nonetheless even this indie-minded quasi-platform

puts forward, economically and discursively, an amended conception of the musical alternative, as slippery concepts such as autonomy, participation, and self-sufficiency—having arguably always existed on a normative knife-edge—are put to work in new, complex ways. Yet here too there is continuity, for the industry surrounding indie has always been involved in negotiations and compromises with the major-led industry "mainstream" that acts rhetorically and discursively as an ideological pole to be resisted.

Conclusion

Mainstream consumer-oriented streaming services such as Spotify and Apple Music are undoubtedly the principal means by which the challenge to the recorded music industry once afforded by digital technologies has been contained. The status of music as property, threatened by the early "pirate" sites' enabling of radical sharing, has now been restored and in recent years the revenues of the global recorded music industry have substantially recovered—though not to the levels achieved at the turn of the century. Revenues now increasingly derive from advertising and subscriptions, rather than the sales of ownable individual items such as "singles" or "albums" that once sustained the late twentieth-century industry. Within this new system, producer-oriented sites such as Bandcamp and SoundCloud represent the residues of the hopes for a democratization of cultural production and consumption that were so widely heard in the first decade of the twenty-first century. In many respects, these producer-oriented platforms have become the principal site for "alternative" music, in the way that independent, alternative record companies and record shops once were (Kruse, 2003). Against excessively pessimistic accounts, we have indicated how some aspects of the sites represent positive values and emancipatory aspirations. However, we have also shown how, like older forms of alternative cultural production and distribution, these services are compromised and problematic, in ways that demonstrate contradictions in the political economy and culture of digital media. We showed, for example, the ways in which SoundCloud offers accessible self-publishing and music abundance, but struggles to be sustainable. Meanwhile, Bandcamp seeks to act as an "alternative" platform but finds relative stability partly via (often unacknowledged) congruences between platform ideologies on the one hand and values of its indie and DIY admirers on the other.

Declaration of Conflicting Interests

CHAPTER 23

Indie or Mainstream? Tensions and Nuances between the Alternative and the Mainstream in Indie Games

Ólivier Pérez-Latorre

Anàlisi 54 (2016): 15–30. https://doi.org/10.7238/a.v0i54.2818.

Abstract

The commercial emergence of "indie games" since 2008 represents a fundamental challenge for contemporary game studies. As we still do not have a clear definition of the indie game, its popularity and commercial success have made the conceptualization of this type of game even more complex. Far from being a pure videogame model, completely separated from the mainstream sphere, indie games often involve hybridizations and ambiguities between the alternative and the mainstream. Thus this article aims to problematize the neat conceptualizations of indie games as an opposing "genre" to mainstream games by exploring the many tensions and nuances between the alternative and mainstream dimensions that can be identified within indie game production, culture and design. The first part of the article focuses on the production and distribution issues, as well as on the cultural construction and artistic legitimation of indie games. The article then posits a design-centered analytical approach to indie games inspired by Kellner (1995) and based on "procedural rhetorics" (Bogost, 2006; Flanagan and Nissenbaum, 2014). This approach is used to look at commercially successful

CC BY

indie games, which we consider to be an especially suitable object of study for exploring and understanding contemporary culture through the frictions between hegemonic culture and counter-culture, progressivism and conservatism, capitalism and anti-capitalism, as well as the way we conceive these notions.

Keywords

indie game, design, culture, ideology, mainstream

Resumen

¿Indie o mainstream? Tensiones y matices entre lo alternativo y lo mainstream *en los* indie games

La emergencia de los *indie games* como producto comercial desde el año 2008 supone un reto fundamental para los estudios contemporáneos del videojuego. Cuando todavía carecemos de una clara definición del *indie game*, su popularidad y comercialidad hacen que la conceptualización de este tipo de videojuego resulte más compleja si cabe. Lejos de constituir un modelo de videojuego «puro», completamente separado de la esfera *mainstream*, los *indie games* a menudo presentan hibridaciones y ambigüedades entre lo alternativo y lo *mainstream.* En este sentido, este artículo pretende problematizar la conceptualización nítida de los *indie games* como un género opuesto a los videojuegos *mainstream*, a través de una exploración de las múltiples tensiones y matices entre lo alternativo y lo *mainstream* que pueden ser identificadas en los procesos de producción, la cultura y el diseño de los videojuegos *indie*. La primera parte del artículo se centra en aspectos de producción y distribución, así como en la construcción cultural y la legitimación artística del *indie game*. A continuación, se desarrolla un análisis del diseño de *indie games* inspirado en Kellner (1995) y basado en la retórica procedural (Bogost, 2006; Flanagan y Nissenbaum, 2014). Este análisis se aplica a *indie games* con éxito comercial, considerándolos un objeto de estudio particularmente interesante para explorar y entender la cultura contemporánea a través de las fricciones entre cultura hegemónica y contracultura, progresismo y conservadurismo, capitalismo y anticapitalismo, y el modo en que estas nociones son concebidas.

Palabras clave

indie game, diseño, cultura, ideología, mainstream

Introduction

The origins of independently produced videogames or "indie games" go back (at least) to the 80s, with young fans powering the British videogame industry by creating videogames in their bedrooms (Donovan, 2010, p. 111–138). But indie games have never been as popular as they are now since 2008, after the international success of games like *Braid* (J. Blow, 2008), *Castle Crashers* (The Behemoth, 2008) and *World of Goo* (2D Boy, 2008). These videogames and many other indie games that followed in their wake (eg Limbo [Playdead, 2010], Minecraft [Mojang, 2011], Journey [Thatgamecompany, 2012], etc.) achieved great sales

success and critical acclaim. Online distribution platforms of large companies such as Steam (Valve Corporation) have now on their virtual shelves a specific space for the indie "genre".

As we still do not yet have a clear definition of the indie game, its popularity and commercial success have made the conceptualization of this type of game even more complex.

In this context, this article has two objectives. Firstly, it aims to problematize any neat conceptual distinction between "indie games" and "mainstream games", exploring the many tensions and nuances between the two categories that can be identified within indie game culture.

A reference from film studies that is particularly close to this approach is Indiewood, USA: "where Hollywood meets independent cinema", by Geoff King (2009), which is an exploration of the "area in which Hollywood and the independent sector merge or overlap" (2009, p. 1). As King explains, with an argument that is also worth applying to "indiewood games": "films produced and distributed in this domain have attracted a mixture of praise and controversy. From one perspective, they offer an attractive blend of creativity and commerce, a source of some of the more innovative and interesting work produced in close proximity to the commercial mainstream. From another, this is an area of duplicity and compromise, in which the 'true' heritage of the independent sector is sold out, betrayed and/or co-opted into an offshoot of Hollywood" (2009, p. 1).

As a complementary objective, this article proposes an analysis of the design characteristics of popular indie games that have had remarkable sales success in recent years, based on the premise that they are an especially suitable object of study for exploring the ideological debates and disputes characteristic of our time, the tensions between mainstream culture and alternative culture, and between conservatism and progressivism (Kellner, 1995; Cassar, 2013).

The next two sections deal with the production and distribution issues, as well as with the cultural construction and artistic legitimation of indie games. The last section focuses on the aforementioned analytical contribution, oriented towards indie game design.

Indie or mainstream?
Tensions and nuances in the production/distribution dimension

The rules of the Independent Games Festival (the largest annual gathering of the indie game sector, inspired by the Sundance Film Festival) state that videogames that want to be presented at this festival need to meet two conditions: (a) to have been produced by an independent developer, and (b) to have been created with an "indie spirit" (DeJong, 2013, p. 16).

Neither of these conditions are easy to objectify, as we shall see, but they do show that the indie game phenomenon is multifaceted in nature involving production and distribution processes as well as a cultural dimension and a certain design approach, regarding the so-called "indie spirit".

As for the first aspect, the indie game is partly defined by differentiating it from the hegemonic production and distribution dynamics of the videogame industry. Mainstream commercial videogames are published by major "publishers", eg Electronic Arts or Activision/Blizzard, which are usually associated with a capitalist ethos: the pursuit of economic benefits over artistic or cultural purposes (Lipkin, 2013, p. 9). Commercial videogames are also often developed by large teams with budgets that can reach hundreds of millions of dollars.

Discourses on indie games connect with traits that are quite the opposite of the above: "independent games are (said to be) usually made without the help of a publisher, have a limited budget (...), but are also groundbreaking and beyond what is proposed by the mainstream industry (...)" (Ruffino, 2013, p. 111).

The new online distribution channels play a crucial role here: they provide opportunities to access a wide audience and market games without having a publisher, either through direct ways (eg the author's personal webpage) or through the online distribution platforms of companies such as Microsoft (Xbox Live), Sony (PlayStation Network) and Valve Corporation (Steam).

This "bypassing" of the physical sales outlets makes it possible for low- budget videogames, which are intended to have low market prices, to be profitable for their creators, or at least allow them to cover their investment.

Other features that are usually associated with indie games are the use of low-cost technological tools (Flash, Java, open source software, etc.), and the use of social networks for crowdfunding through platforms like Kickstarter or Indiegogo (Lipkin, 2013, p. 12, 20).

However, some authors have questioned the "indieness" of the production and distribution forms of the most representative games of the indie phenomenon in recent years (Martin and Deuze, 2009; DeJong, 2013).

To begin with, De Jong states that "most of the games that people nowadays think of as indie (…), like *Super Meat Boy*, *Flower* and *Braid* (…), were distributed via platforms that are owned by major publishers; they only gained such commercial success because they were successfully marketed and branded as indie games on these platforms" (DeJong, 2013, p. 16).

Moreover, a supposed "indie game" like *Journey* (Thatgamecompany, 2012) was developed by a fairly large team of 14 people and published by Sony Computer Entertainment, with a budget of "multiple millions of dollars" (according to its creative director, Jenova Chen, [1] which puts in question its "indie" condition.

Martin and Deuze (2009) argue that the concept of "independence" is extremely complex to analyze in the contemporary videogame, and that the relationships between the indie and the mainstream, rather than corresponding to a polarized confrontation, present many gray areas, including negotiations and agreements between developers and publishers with very specific factors in each project, and even symbiotic relationships based on common interests.

In this sense, these authors stress the importance of the intellectual property in the power relationships established between creators and publishers (Martin and Deuze, 2009, p. 282). They also highlight the growing interest of big companies in publishing "indie" games, and even establishing their own publishing brand of indie style titles, for example the case of Capcom's *Clover* (2009, p. 284–285), as well as the appearance of small publishers that specialize in publishing indie projects, such as Nicalis.

Artistic legitimation and ideological tensions in the cultural construction of indie games

Beyond a series of tangible features related to production and distribution processes and economic aspects, the indie game phenomenon is also (and perhaps above all) a cultural construction.

A central issue in this respect is the construction of the cultural identity of the indie game authors (Martin and Deuze, 2009, p. 280). In fact, the "politique des auteurs" of the French/European cinema, which once was a fundamental hallmark of independent films compared to Hollywood cinema, now resonates with the indie game phenomenon. One manifestation of this is the emphasis placed on the author's name in the paratexts and display screens of indie games—for example, the message "made by Notch" at the beginning of *Minecraft* (Mojang, 2011).

Parker (2013, p. 45–47) points out that before the strong artistic legitimacy that many indie games authors now enjoy, a number of preconditions needed to appear in the cultural ecosystem of videogames. The first thing that was necessary was the emergence of a series of "prestigious works" in the mainstream area by authors who were exalted by critics and the public as "artists"; eg cult videogames like Ico (Team Ico, 2001) and Shadow of the Colossus (Team Ico, 2005) by Fumito Ueda. The progressive incorporation of game studies in the academic world was also slowly preparing the ground for the emergence/growth of the indie game phenomenon, with its authors strongly aligned with artistic and aesthetic aspirations, as well as, in many cases, with the idea of videogame creation as a political/ideological act.

Martin and Deuze (2009, p. 278–279) also point out that technological factors, such as the new digital distribution channels and the rise of videogames for mobile devices, were also relevant preconditions for facilitating the emergence of individual authorship, as well as new opportunities for small development teams.

In the favorable context defined by these preconditions, the discourses of the indie games creators and other cultural agents (critics, the media, academia, fans, festivals such as The Indie Games Festival and Indie Cade) have gradually formed a certain sociocultural profile of the indie games author, which has now spread throughout the collective imagination.

This profile is marked from the outset by the aspiration of "creative freedom". The indie authors postulate the creation of videogames as an act of personal expression, where the author should feel emotionally and ideologically very much implicated in the project. Naturally, this contrasts with the vision of the mainstream game as a commercial product orientated towards "superficial" entertainment, as well as with the idea of the working conditions of the large companies in the industry constraining the freedom and creativity of their workers (Lipkin, 2013, p. 11, 14; Westecott, 2013, p. 79–83; DeJong, 2012, p. 20).

This is closely linked to indie authors (and the fans of indie games) having a strong hostility towards the mainstream videogame (DeJong, 2012, p. 22; Ruffino, 2013, p. 110–111; Parker, 2013, p. 54). A paradigmatic example of this is the following statement by Tommy Refenes, coauthor of Super Meat Boy, in the documentary Indie Game: The Movie (Swirsky and Pajot, 2012).

> "... I'm not going to go work at Electronic Arts or Epic. That sounds horrible, that sounds like Hell to me. So if it comes out and people don't like it, and people hate it, and it has a Metacritic score of

> like 20, and everyone thinks it's awful... It doesn't really make a difference (...) We tried to make it as fun and as accessible as possible. [However,] if people want to buy *Modern Warfare* or *Halo: Reach* that's fine, because I think those games are shit. If that's what people want, then they don't want my games, because I don't make shit games."

This rejection of mainstream video games is deeply connected with a certain ethic and/or style in the way the creation of video games is understood and carried out by indie game authors. They usually appeal to "do-it-yourself" creative philosophies (Lipkin, 2013, p. 11, 15; Westecott, 2013, p. 80–84, Parker, 2013, p. 46), the idea of "small but good" (Indie Game Magazine, in Lipkin, 2013, p. 14), and the defense of low cost technological tools, combined with an ideal of democratizing access to videogame development (Anthropy, 2012; Westecott, 2013, p. 81).

Behind all this lies a significant ideological component: anti-establishment attitudes, associated with anti-capitalism, criticisms of neoliberalism, the desire to shed light on society's "blind spots" (eg, socially weak groups, stereotyped or under-represented in the mass media and in the videogame market), etc.

Moreover, note that statements such as those made by Tommy Refenes, cited above, are also linked to a certain sense of cultural/artistic superiority of the authors and fans of indie games with respect to mainstream videogames. These discourses often allude to the indie creators and the games themselves being more "authentic", having a higher aesthetic and experiential value beyond videogames as mere entertainment. In this sense, the issues addressed in indie games and the way they are treated are often suggested to be more "mature" or "transcendent" than in the common videogame: indie games often deal with universal and existential themes, such as love or death, focusing on them abstractly and/or with dense symbolisms throughout the game (Martin and Deuze, 2009, p. 289; Parker, 2013, p. 48).

At the same time, a significant element in the "strategy" of artistic legitimacy of the indie game is a certain cultural appropriation of experimentalism with the "game design". The personal expression of the author through game mechanics and other elements of the game design is regarded as the "essence" of the art of creating videogames (cfr.: "procedural rhetoric", Bogost, 2006), which is opposed to videogame blockbusters, in the sense that their design often relies heavily on cinematic narrative. This leads to the idea that the mainstream or blockbuster videogame has less artistic "purity" than indie games (Parker, 2013, p. 54–55; Martin and Deuze, 2009, p. 280–281). In any case, it is interesting to note how, from a contextual limitation (having major film narratives in videogames implies a considerable increase in the budget), there emerges a legitimizing discourse on the cultural level, which enhances the artistic status of the indie game and its authors (Simon, 2013).

In the end, all of this connects with the social hierarchies of taste (Bourdieu, 1988): indie games are, in a way, a new cultural area through which some videogame fans can obtain a culturally "distinguished" position, separating themselves from the tastes of the majority.

Regarding the cultural vehicles for spreading indie game culture and the construction of the cultural identity of the authors, we need to highlight "The Rise of the Videogame Zinesters", the theory/manifesto by Anna Anthropy (2012)—a cult book among indie game fans that, explicitly or implicitly, deals with many of the arguments legitimizing the indie game reviewed here.

Lipkin (2013, p. 20) underlines the activism of many indie game authors in social networks; for example, the fact that all members of the Mojang team (*Minecraft*) have an active Twitter account, or the popular personal blog of Edmund McMillen, creator of *Super Meat Boy* (2008).

In connection with this, the important role of indie game fan communities, such as Indiegames.com, Indie Statik and TIG Source, for the construction and cultural legitimation of indie games and their creators should not be forgotten. These communities show a remarkable collaborative spirit, with young people who aspire to one day become indie authors becoming involved in peer-to-peer teaching dynamics (Martin and Deuze, 2009, p. 290; DeJong, 2012, p. 19). Furthermore, these communities are often proactively involved in the development of certain indie projects from the beginning (collaborating in tests, providing reviews and recommendations for authors, etc.), and even sometimes contributing to the financing of these projects through crowdfunding.

Meanwhile, Parker *(2013, p. 50–55)* stresses the role of the specialized press and game scholars for understanding the rise of indie games and their cultural legitimacy in recent years. As an example, he refers to a short article by the scholar Ian Bogost on the indie game *Passage* (Jason Rohrer, 2011), a small videogame without a budget and with very limited graphics. In his blog, Bogost exalted *Passage* as a fundamental example of the expressive possibilities of videogames (focused on the game design, the "procedural rhetoric"), as well as to "talk" about important issues (love, death, loss) and provoking deep thoughts and emotions in the user. Later, other specialized academics and journalists would continue this laudatory discourse. Currently, *Passage* is a cult indie game and Jason Rohrer, who was an amateur when he made the game, has become a professional videogame creator with notable prestige in the indie community.

Finally, it is interesting to conclude this section with a reflection on *Indie Game: The Movie*, the documentary that premiered at the Sundance Film Festival and which narrates the personal experience of several indie authors (mainly Jonathan Blow-*Braid*, Edmund McMillen and Tommy Refenes-*Super Meat Boy*, and Phil Fish-*Fez*). The documentary presents these young videogame creators to a large extent as romantic heroes, lone, talented creators facing a giant industry, who sacrifice their personal lives to pursue a childhood/adolescent dream and an artistic ideal. For its narrative quality and "hook", this documentary has been instrumental in mobilizing affects toward the indie game as a cultural phenomenon and to its heroes, those young videogame creators.

However, there are certain complexities and ideological frictions behind this "heroic" portrayal of indie games creators. Indeed, in a context in which contemporary capitalism has become associated with the ideal of the neoliberal subject, it is certainly complicated to attribute a counter-cultural label to "indie" creators who actually fit the profile of the lone entrepreneur (Ruffino, 2013, p. 116–119).

According to Nikolas Rose *(1998, 1999)*, the concept of the neoliberal subject is based on the idea of autonomous individualism: a subject who is responsible for themselves to find work and which corresponds to the ideal of becoming an "entrepreneur" of themselves. Thus the neoliberal subject is associated with values such as meritocracy, constant appeals to talent and hard work, and the ability to adapt to an increasingly unstable job environment, which requires workers to be constantly updating and reinventing themselves and have a highly competitive attitude. All this, implicitly refers to the figure of a "hero" with great adaptive

capacity and autonomy, whose very existence would call into question the necessity for the welfare state and the public administration's strong involvement in the employment and social fields.

It is not difficult to identify many of the key features of the neoliberal subject in the discursive construction of the indie games authors in Indie Game: The Movie and in other texts. In this sense, it is inevitable that we ask ourselves whether the "heroes" of the indie game phenomenon really are counter-cultural heroes, or rather a complex and to a great extent contradictory mixture between it and the neoliberal subject, namely the entrepreneurial hero.

Indie or mainstream? A game design analysis

The implicit tensions, ambiguities and contradictions between the alternative and the mainstream in indie games that we identified in the previous sections; both in production/distribution and in the cultural dimension, must also occur at the design level.

In this sense, Sudmann *(2012)* stated that, contrary to what the indie games author's and fan's hostility towards the mainstream seems to imply, there is not a radical denial or rejection of the forms and design traits of mainstream videogames in indie games (see also: DeJong, 2012, p. 18, 22).

Moreover, the growing consolidation and popularization of a certain "indie style" in the last few years has brought about the phenomenon known as co- optation: the emulation of indie game design style in videogames that have not been developed under real indie production and distribution conditions. For example, Lipkin *(2013, p. 16)* cites the case of *DeathSpank* (Hothead, 2010), a videogame by the renowned author Ron Gilbert and promoted by the big publisher Electronic Arts, which the critics, including Indie Games Magazine, adopted as "indie" (see also Martin and Deuze, 2009, p. 290).

In the reverse sense, Lipkin (2013, p. 18) points out that "with the increasing technical and graphic improvements of games that are being independently developed and produced, such as *Legends of Grimrock* or *Amnesia: the Dark Descent*, it is becoming harder to evaluate a game's 'indieness' by its appearance".

In fact, sometimes authors deliberately mix indie elements with mainstream elements as a design strategy to make the game more appealing to a wider audience. In this regard, the following statements (which seem to reveal a certain degree of guilty feelings) by Edmund McMillen in the magazine Eurogamer (6-29-2012) are significant:

> "*Super Meat Boy* is the closest thing to selling out that I've ever done, but it's not. But it is safe. It's very, very safe, and I knew it was safe going in, and I was playing it safe because I was risking so much (…) I don't want to risk my whole f***ing career and my future on something that is uncertain (…) I'm not comfortable risking [programming and good friend] Tommy [Refenes'], my future and my wife and everybody else."

In any case, as researchers, instead of "worrying" about the high ideological complexity of the indie game phenomenon and its apparent contradictions and ambiguities, we can take advantage of it, as we suggested at the beginning, by adopting the indie game as a very suitable object of study to explore the ideological debates and disputes which are characteristic

of our time, the tensions between mainstream culture and alternative culture, and between conservatism and progressivism.

Along this line, we propose an analysis of the design characteristics of popular indie games in recent years, including their sales and critical success. Indie games that are particularly likely to reflect the tensions between the alternative and the mainstream will be focused on in this article.

The analysis is based on D. Kellner's "double hermeneutics" (1995), which is an analytical approach to media culture texts that, instead of looking for a unique and hypercoherent discourse or "message", focuses on exploring latent ideological tensions between conservatism and progressivism, such as the reinforcement of certain stereotypes and the transgression of others, formal conventions vs. formal innovations, etc. These latent ideological tensions, which the analyst of media culture works must unravel, can be addressed either within a particular, individual text or across a coherent set of several texts (see also Cassar, 2013).

On the formal level, the analysis is informed by game design theory and procedural rhetorics and the theory of game design as an expressive medium (Salen and Zimmerman, 2004; Adams, 2010; Bogost, 2006; Frasca, 2009; Flanagan and Nissenbaum, 2014).

As a way of presenting the results of the analysis, we define five indie-mainstream tensions that characterize the design of the popular indie game in recent years.

Expressive singularity + popular genres

Many popular indie games are characterized by a dense symbolism of the game design in the representation of characters, worlds and underlying themes, in line with procedural rhetoric theory (Bogost, 2006; Frasca, 2009).

A paradigmatic case in this respect is *Braid* (J. Blow, 2008). As the game goes on, the story of Tim progressively unfolds: he lost his love because of a mistake that is never clearly explained in the game, and now he lives obsessed with the past, tied down by regret. The most interesting point is that in *Braid* the "core mechanic" (Salen and Zimmerman, 2004, p. 316; see also Sicart, 2008) is deeply linked to these background questions: it is a mechanic of backwards time, a "rewind" at the touch of a finger. Thus, from a metaphorical perspective, the ludic experience of the player becomes interwoven with Tim's mental and emotional state: the experience of living obsessed with the past, not being able to stop thinking about what you would do if you could go back in time…, which the player must do to solve all the puzzles in the game.

As in *Braid*, an interest in exploring the representation and "simulation" of psychological states through the gameplay design can also be found in other indie games, such as *Amnesia: the Dark Descent* (Frictional Games, 2010) and *The Binding of Isaac* (McMillen and Himsl, 2011):

Amnesia: the Dark Descent, which was inspired by H. P. Lovecraft's stories, portrays the thin line between sanity and madness. The player/character must continuously deal with the dilemma of keeping hidden from monsters by remaining in the shadows but then progressively lose his sanity, or moving through the lit up areas but then be more exposed to monsters. Beyond a simple tactical dilemma that brings more interest to the gameplay, this constant tension between sanity and madness cyclically evokes an essential theme in Lovecraft's literature and it does so in a way that is only possible for the video-ludic medium.

Regarding *The Binding of Isaac*, the vast basement where Isaac goes to try to run away from his evil mother was designed according to the "rogue-like" formula: a random articulation of "dungeons" that generates a new basement for every game. However, in this case the rogue-like system is neither a simple "retro" reference nor just a way to enhance "replayability" (Bogost *et al*., 2005, p. 63–64): this chaotic form of the gameworld symbolically connects with the theme of madness in the game's narrative, since Isaac is actually a kid suffering from parental maltreatment, victim of an unbalanced mother.

In the end, one of the main characteristics of mainstream indie games is the expressive singularity and coherence of the game design in relation to essential aspects of the content, such as the main character's psychology, their relationship with the represented world and certain underlying themes.

Nevertheless, this artistic ambition, closely related to the notion of procedural rhetoric (Bogost, 2006) is usually accompanied by a "mainstream" wrapping: on the macro-structural level, many indie games rely openly on popular commercial genres and gameplay models: for example, the platform genre (*Super Meat Boy [Team Meat, 2010], Cave Story+* [Studio Pixel, 2011], *Braid*), the first-person shooter (*Amnesia: the Dark Descent*), or the "hack-and- slash" combined with roleplaying game elements (*Bastion* [Supergiant Games, 2011]), etc.

Thus, probably one of the keys to the success of "mainstream-indie" games relies on their combination of a very expressive ludic design regarding specific aspects with a global playability framework ("wrapping") with popular tinges based on well-known commercial genres.

Essentialism or casual gaming?

Indie games such as *Super Meat Boy, Fez* (Polytron, 2012), *Limbo* (Playdead, 2010) and *Journey* (Thatgamecompany, 2012) could be associated, in one way or another, to the approach of minimalist game design (Nealen *et al*., 2011).

Thus, one of the pleasures behind the gameplay experiences in *Super Meat Boy* and *Journey* is just learning to "tame" the avatar, mastering the control of his particular ways of moving: *Meat Boy's* jumps with long suspensions and strange acrobatics and the fascinating "dance" through semi-flight over the dunes by the avatar of Journey, seeking impulse points around the ruins.

Besides, *Fez* sets out a slow-paced and contemplative exploration experience, through many island-worlds that hide countless little treasures, hieroglyphs and secret passages, and where meticulous observation and patience (including going back to a certain place at a different time in order to check if something has changed) become fundamental actions in order to understand the game and be able to progress. In the words of the author himself, Phil Fish, *Fez* is a videogame where the player must learn to appreciate the significance of "stop and smell the flowers" (NowGamer, 6-21-2011).

In a similar fashion, Limbo's puzzles usually reward the player's sensitivity: a detailed observation, paying attention to a little noise caused by something that fell down behind them, carefully measuring every step in order to get as close as you can to a winged insect without scaring it… Attention to little details, delicacy, patience.

Undoubtedly, the search for essentialism and simplicity in many *(but not all)* indie games contrasts with the big audiovisual spectacles of blockbuster videogames. Nevertheless, again in this respect we can find an alternative + mainstream "circle squaring": essentiality and

simplicity allow them, at the same time, to get closer to the "casual gaming" formula, which is a model of commercial success in recent years (Juul, 2010; Martin and Deuze, 2009, p. 284). Significant evidence in this respect is the fact that *Braid* obtained the "Casual Game of the Year" award from the Academy of Interactive Arts & Sciences in 2009.

Innovation + conventions and commercial trends

Indie games such as *Braid* and *Fez* base their proposal on very particular and innovative game mechanics: the backwards time mechanic with several variations in Blow's game, and the 2D-3D shifting mechanic in *Fez.*

Moreover, the originality and innovation of many indie games frequently come from the omission or transgression of design canons of mainstream videogames.

At first sight, in indie games such as *Journey, Limbo* and *Minecraft* (Mojang, 2011) there is no point system and "economic" management elements such as HUDs (head-up displays) are non-existent, scarce or very subtle. Moreover, in games such as *Minecraft* and *Journey* there is not even a clear objective for the player/character.

Although in Edmund McMillen's games there are usually point systems and clear objectives, other typical aspects of mainstream videogames become subverted, such as the "reward system" (Salen and Zimmerman, 2004, p. 345–350): what in a blockbuster would usually be a scene where the player/character gets a reward after having completed a level, in McMillen's games that scene has an ironic or anticlimactic tone. In *Super Meat Boy* it's a compilation of all the player's failures in that given level (it shows dozens of Meat Boys crashing against walls, falling into the void, etc., through a visual fusion that invites the player to laugh at their own clumsiness), and in *The Binding of Isaac* it's a short video showing relatives and friends humiliating poor Isaac.

Nevertheless, popular indie games also tend to incorporate classic principles of game design and trends of commercial successes.

Without going any further, in *Journey* there is a subtle "leveling up" system related to the avatar's evolution: by collecting magical clothing it is possible to make the avatar's cape longer, which allows him to perform longer lasting jumps and flights. (However, this is neither necessary nor relevant at all to going forward in the game).

Other prototypic traits of commercial videogames are also present in many indie games, as we have seen previously: for instance, basic elements of platform and puzzle genres, and certain elements of "casual gaming".

Nostalgia and criticism of industry's successes

Nostalgia for the 8- and 16-bit eras of gaming stands out as a particularly relevant trait of indie game design style, according to several researchers (Martin and Deuze, 2009, p. 291; DeJong, 2012, p. 18; Lipkin, 2013, p. 10, 15–18).

In this vein, *Super Meat Boy i*s better understood if it is connected with Super Mario Bros (Nintendo, 1985) (McMillen made the platforms to be "enemies" instead of "allies"), *The Binding of Isaac* can't be fully appreciated without remembering *The Legend of Zelda* (Nintendo, 1986) (it is actually a deconstruction of type-dungeons of *Zelda*, submitted to random permutations), and *Cave Story+* and *Fez* can't be fully analyzed without relating them to the

labyrinthine exploration and the "backtracking" of *Metroid* (Nintendo, 1986) and *Castlevania* (Konami, 1997).

It is evident that authors such as Edmund McMillen, Phil Fish and Daisuke Amaya ("Pixel") are "fans" of the old classics of Nintendo, Konami, etc., to which they pay tribute in their games. Nevertheless, this nostalgic component is closely interwoven with a strong criticism of the contemporary videogames industry and current big-budget mainstream videogames, as we saw before.

Anti-capitalist fun or cultural distinction?

Indie games may have design traits in tune with consumer society values and capitalism, such as progression understood in quantifiable terms, accumulation of resources, challenges related to great conquests of territory, etc. (eg, *Super Meat Boy, Bastion, Cave Story+).*

However, a lot of design traits with an anti-capitalist orientation can also be found among them: many indie games don't allow the "race" to achieve higher and higher levels of the player/character *(Super Meat Boy, Limbo, Fez*), prevent the player from collecting objects *(Journey)*, promote the management of scarce resources *(Amnesia: the Dark Descent, FTL* [Subset Games, 2012], and so forth.

Moreover, in some of them all references to the notions of "victory" and "defeat" are eliminated. In certain cases "victory" isn't even possible *(Minecraft)* and in others the concepts of "failure" and "defeat" become diluted: in Journey and Fez it is practically impossible for the player to "fail" and, in any case, it is not penalized.

In line with this, Jenova Chen has been openly critical of what he calls an excessive leaning towards "task-solving culture" in videogame design (Gamasutra, 5-18-2012): that is, understanding fun as something inherent to efficient problem solving. Therefore, he decided not to give a clear objective to the player in *Journey*, or even intermediate goals or a point system. In this sense, more than either a competitive game or a problem-solving game, *Journey* brings just an aesthetic experience to the player.

In addition, some indie games seem to have a certain "the weak against the system" poetic. Thus, in *Amnesia: the Dark Descent* (Frictional Games, 2010) the design of the player/character follows a principle of lack of empowerment: Daniel, the main character, comes up against illusory and supernatural monsters but there are no weapons in the castle where the story takes place, so when they appear the only thing he can do is run away. In this vein, avatars such as Meat Boy and the kid of *Limbo* die at just one touch, they are extremely fragile. These characters do not have a "health bar", which usually allow the strikes to be "cushioned", thus for them every hit, every mistake, becomes a lethal strike, a lethal mistake.

Moreover, in games like *Super Meat Boy, Limbo, Fez* and *Amnesia* there is no possibility of evolution regarding the character's action abilities: the avatar begins with only the abilities of walking, running and jumping *(not much more)* and these remain their only ones for the whole game.

All of these aspects together point to a sort of gameplay design that we could call "counter-fun" or "anti-capitalist fun", an entertainment proposal characterized by depriving the videogame of common videogame design elements potentially linked to capitalist values, consumerism, or to the maximization of efficiency and benefits, as well as by counteracting the fantasies of power common in mainstream videogames.

Nevertheless, from a very different point of view, the notion of "counter-fun" could recall the theory of taste as a cultural distinction by P. Bourdieu. In *Distinction: A Social Critique of the Judgment of Taste*, Bourdieu suggests that one of the distinction strategies of "high culture" consumers is to show a certain capability of appreciating "pleasure deprived from pleasure" in cultural works and experiences (1988, p. 501), something supposedly suitable only for refined tastes.

> "…In the negation of inferior, coarse, venal, servile—in a word natural—pleasure (…) there lies a claim to superiority on the part of those who are able to content themselves with sublimated, refined, selfless, disinterested, distinguished pleasures forever out of reach of the uninitiated" (Bourdieu, 1988, p. 501)

That is, the "counter-fun" of indie games probably has also a certain element of cultural seduction, as it entails a sort of invitation to feel part of a "high culture" community.

Final considerations

Through this study we have seen that the cultural dynamic behind indie games doesn't follow a monolithic logic of opposition or dissociation from the mainstream videogame, but a much more complex relationship, sometimes including strategic articulations of the alternative and the commercial.

In fact, popular indie games and "mainstream-indie" games are nowadays an indispensable reference for the industry in terms of how innovation, artistic status and commercial success can be integrated. Moreover, as G. King pointed out (regarding "indiewood" cinema), culturally they represent a very controversial area, "an area of duplicity and compromise, in which the 'true' heritage of the independent sector is sold out, betrayed and/or co-opted into an offshoot of Hollywood [the videogame industry]" (2009, p. 1).

As for the original contribution of this paper, we have proposed a design- centered analytical approach to indie games, inspired by Kellner (1995) and Cassar (2013) and mixed with "procedural rhetorics" (Bogost, 2006; Flanagan and Nissenbaum, 2014), whereby indie games (indie game design) can be understood as a cultural phenomenon that reflects ideological tensions of our time, frictions between hegemonic culture and counter-culture, progressivism and conservatism, capitalism and anti-capitalism, and the way we conceive these notions.

CHAPTER 24

Making Media Together: Experiences of Aboriginal Participation within Co-Creative Remote Media Production Teams

Laura McDowell

Journal of Alternative & Community Media 3, no. 1 (2018): 33-48. https://doi.org/10.1386/joacm_00038_1.

Abstract

This article outlines the findings of a research project that examined how participation can be understood, and subsequently improved, within collaborative, co-creative media practices. As a case study, the research project looked at Pintubi Anmatjere Warlpiri Media and Communications (PAW Media), a remote Indigenous media organisation (RIMO) based in Yuendumu in Australia's Northern Territory. By means of 13 in-depth interviews, grounded in participant observation, the project examined how Aboriginal participation was motivated, enabled and limited from the perspectives of Aboriginal and non-Aboriginal collaborators. The study revealed practices of Aboriginal participation at PAW Media that were highly valued by participants; nonetheless, limits to participation were noted and two conflicting views regarding improved practice expressed. Non-Aboriginal facilitators supported a transition towards greater Aboriginal autonomy over production, involving a handover of tasks and responsibility to their local Aboriginal counterparts; however, most Aboriginal media pro-

BY-NC-ND

ducers indicated that their participation was currently better served within a refined version of the existing co-creative structure.

Keywords

Aboriginal producers, co-creative, cross-cultural, Indigenous media, participation, production, remote, teams, Warlpiri, Yuendumu

Introduction

It is another hot summer afternoon in the remote Central Australian community of Yuendumu, 300 kilometres north-west of Alice Springs. Inside one of the studios at the local Indigenous media organisation, a few young men sit together making props for an upcoming film project. They discuss the footy, laugh about YouTube clips they have seen and share ideas for the film's storyline. Their conversation drifts between English and the local language, Warlpiri. Two of the media workers are Aboriginal, from the local community, and the other is a 'whitefella' facilitator. In neighbouring rooms, other small, cross-cultural teams work together to produce local video, radio and music projects. The organisation for which they work is called Pintubi Anmatjere Warlpiri Media and Communications, or PAW Media. It is one of eight remote Indigenous media organisations (RIMOs) in Australia.

The production model at PAW Media can be described as an example of 'co-creative media', involving collaborative relationships between professional producer/facilitators and community media workers to produce storytelling projects (Rennie, 2013: 21). Co-creative media practices can be found in various forms across Aboriginal and Torres Strait Islander community, arts, disability and educational sectors in Australia (Woodrow et al., 2015: 150–1). Co-creative media gives people from marginalised and disadvantaged groups the opportunity to participate in media and storytelling production through collaboration with a facilitator. This key collaborative relationship between participant and facilitator, and the way participation is motivated, conceptualised, enabled and limited within it, is the focus of the research project discussed in this article.

As a case study through which to explore co-creative media, my research examines lived experiences of participation within cross-cultural, collaborative media production teams working at PAW Media. By focusing on a case study within the context of remote Indigenous media production, the research offers insights into a model of co-creative media that has been operating in various forms for more than 30 years. By means of 13 in-depth interviews with Aboriginal and non-Aboriginal collaborators, grounded in participant observation, the study describes the current practices of participation at PAW Media. It also uncovers how an ideal form of participation in media is conceptualised, and documents recommendations to help reach that ideal. Through this process, I propose a framework for evaluating participation in co-creative media practices that can be applied both within and outside the remote Indigenous media sector.

To date, academic research into co-creative media has focused on theorising, mapping and describing the concept, and its position within the broader field of participatory media, storytelling and research (Spurgeon et al., 2009; Woodrow et al., 2015). Literature on co-creative media offers the key insight that participation in participatory media is often something that

is actively facilitated, rather than an organic occurrence in response to a new technology (Rennie, 2013: 23). However—perhaps because it is a relatively new area of study—the literature is limited in its accounts of how participation is facilitated, experienced and limited, and the power dynamics at play within the central participant-facilitator relationship. For people in marginalised communities, including remote Aboriginal communities, the ability to participate in media can be empowering (IRCA, 2010: 6–7). Without first understanding how participation is conceptualised and experienced by those performing it, though, we are limited in our capacity to evaluate and improve co-creative media as a participatory practice.

Theoretical framework

Participation

Most scholarship positions participation within the context of Western democratic ideals (Arnstein, 1969; Carpentier, 2011; Pretty, 1995; White, 1996). Here, types of participation are assessed within two binaries. High participation features acts of maximal control, with individuals and communities being able to significantly influence the socio-political structures in which they exist, and thus hold those in power to account. Meanwhile, low participation features activities with negligible power redistribution. Participation is here differentiated from concepts such as interaction or access (Carpentier, 2012). With the community media sector increasingly needing to demonstrate its social impact, this maximalist view of participation is a valuable concept to incorporate within evaluative and analytical frameworks (Dreher, 2017: 14).

A notable and commonly cited academic model for evaluating participation is Arnstein's ladder of citizen participation, details of which were first published in 1969. Eight categories are proposed, ranked as rungs on a ladder, ascending from least to most reflective of empowering participation (Arnstein, 1969: 217). Ascending from the bottom, the categories are: manipulation, therapy, informing, consultation, placation, partnership, delegated power and citizen control (1969: 217). Only the top three categories of citizen control, delegated power and partnership are described as being reflective of citizen power, while the remaining categories are classed as tokenism or non-participation (1969: 217).

There are some limitations to Arnstein's ladder and similar participation evaluation frameworks. They do not allow for the dynamic, non-linear and evolving nature of participation (Potter, 2014: 44). The models fail to shed light on who participates, and the activities in which they participate (Cornwall, 2008: 275–6), or to consider the right not to participate (Potter, 2014: 44). Further, the Western democratic ideals underpinning the models may exclude other ways in which participation can be valued in alternate cultural and political contexts.

In attempting to find a way of thinking about participation that is useful within the non-Western setting of my research, I will try two approaches. First, in keeping with key literature on critical participation, I recognise participation as synonymous with power; however, given the non-Western setting of this research, it is possible—even likely—that Aboriginal study participants perceive participation in different terms than those valued in the models. Therefore, though I reference Arnstein's ladder in my research findings, I will also preference an evaluative approach that considers participation more subjectively. How

it is understood and valued should be dependent on the perceptions and lived experiences of participants, as shaped by their political and cultural contexts. This approach to participation reflects Couldry's (2010) theorising on the notion of voice. Couldry points to the necessity of understanding voice in terms of how it is valued by subjects whose voices are, or are not, reflected in social, cultural and political institutions. In my research, only by first finding out how PAW Media's production staff experience and perceive Aboriginal participation have I been able to make context-specific recommendations to support that participation.

Participatory and co-creative media

The term 'participatory media' describes bottom-up, inclusive, process-driven approaches to media production, and represents an alternative to top-down, outcome-driven orthodox media structures (Spurgeon et al., 2009: 276). Participatory media allow people who would otherwise only be media consumers to also be media producers (Rennie, 2013: 23). Huesca (2008: 191) lists three components of participatory media production: (1) access to communication resources; (2) participation in key aspects of production; and (3) collective ownership and policy-making.

However, literature on participatory media often fails to critique the organisational and social structures enabling, shaping and potentially restricting participation (Spurgeon et al., 2009: 276). Participatory media frameworks can be too technologically determinist, assuming that practices spring up organically when new media technologies arrive (2009: 276). In reality, participation is often the result of planned and intentional processes involving professional facilitators and organisations (2009: 276).

Challenging the assumption that participation in media is always an organic, participant-led process, the term 'co-creative media' is used to describe a type of participatory media (Rennie, 2013: 23). The co-creative model assumes that many people interested in being involved with participatory media projects are unable or unwilling to take part in every aspect of production. Here, facilitators can fill in these gaps, allowing participants to participate in the capacity of their choosing (Spurgeon et al., 2009: 280). In this sense, a co-creative approach is a way of configuring participation in relation to the technical and industrial process of media production.

Ideally, co-creative media projects allow for the 'best of both worlds'. They bring people with unique perspectives and non-mainstream stories together with professional media producers and facilitators. However, the reality of negotiating the constantly evolving roles and power dynamics at play between the two parties can be complex. According to Rennie (2013: 24), drawing attention to the role of professional facilitators within participatory media should not undermine the authenticity of participation; rather, the co-creative model acknowledges that facilitated relationships often exist within the production process, and could have positive and/or negative effects on participation.

Background: PAW Media and its cross-cultural, co-creative workforce

PAW Media is a RIMO based in Yuendumu in Australia's Northern Territory. The organisation, formerly known as Warlpiri Media Association (WMA), emerged in the early 1980s. It has

since grown to service 14 remote communities with radio and other media, and has a footprint stretching more than 450,000 square kilometres (PAW Media and Communications, 2016b).

One catalyst for the early development of WMA was the arrival of United States-born anthropologist Eric Michaels in the 1980s (Hinkson, 2002: 202). He came to Yuendumu after hearing local people had started using video cameras, a novel instance of remote Indigenous media production in Australia (Hinkson, 2002: 202). Michaels worked alongside local video producers such as Kumanjayi Japanangka Granites and Francis Jupurrurla Kelly to develop a 'Warlpiri approach to video' (PAW Media and Communications, 2016a: para. 2). Since Michaels' departure from Yuendumu in the late 1980s, a succession of non-Aboriginal managers have been employed (PAW Media and Communications, 2016a). From the late 1990s, non-Aboriginal employees have also worked in full-time video and radio facilitation and production roles (PAW Media and Communications, 2016a). Local media workers outnumber their non-Aboriginal counterparts, but tend to work casually or part-time. It is typical for local staff to be away for extended periods, but return to PAW Media weeks, months or even years later. At the time of my research, there were four non-Aboriginal producers and about 15 to 20 local Av producers working across radio, video, animation and music platforms.

Not all media produced by the organisation is a result of co-creative practice. Some projects—especially in the music department—are entirely locally organised and created; however, the majority of work produced at PAW Media is the product of some level of cross-cultural collaboration.

Method

Participants

As mentioned above, I conducted interviews with 13 participants working in radio, video, music and/or animation production at PAW Media. Nine of the participants were Aboriginal, employed as local community media workers. Four of the participants were non-Aboriginal, employed as producers, trainers, facilitators and coordinators. The average (mean) age was 42 years for Aboriginal participants and 44 years for other participants. Aboriginal participants had been employed at PAW Media for an average of 4.6 years, while their non-Aboriginal counterparts had been employed there for an average of 2.5 years. First languages spoken by Aboriginal participants included Warlpiri, Anmatjere, Arrente and English. The first language of all non-Aboriginal participants was English.

Researcher role

Prior to conducting this research, I worked for PAW Media as a radio producer for almost three years between 2012 and 2014. During that period, I collaborated with local Aboriginal broadcasters to produce live and pre-recorded radio for the 14 communities on PAW Media's footprint. This job was my first experience working in a remote Aboriginal community, which was an immense privilege; however, I found it difficult to fully understand and justify my role, as a non-Aboriginal person, in facilitating Aboriginal media production. On a personal level, this research project represented an opportunity to better understand my facilitator

role in relation to enabling and limiting Aboriginal participation. On a broader level, I hope this research can be developed into a useful resource for other facilitators and organisations supporting Aboriginal participation in remote community workplaces.

As a former employee, I consider myself as more an insider researcher than an outsider researcher (Gair, 2012: 137). This study benefited from advantages generally granted to insider researchers, including easier access to organisational gatekeepers; a pre-established rapport with participants; and an existing understanding of local context (Unluer, 2012). However, the study may have been disadvantaged if my established familiarity had censored the information participants chose to share, so as not to upset our existing relationships. I endeavoured to minimise this risk in the interviews by asking broad, non-leading questions. In data analysis, I remained alert to the possibility of participant self-censorship, and where I believed that it may have been a factor, I disclosed this doubt in the findings. In data collection and analysis, I acknowledge my reflexivity as a researcher.

Data collection

Research was conducted during two field trips. The first was to a Remote Indigenous Media Festival, hosted by PAW Media in the Warlpiri community of Lajamanu for one week in October 2015. The second field trip was a week-long visit to PAW Media's base in Yuendumu in April 2016.

Given that this was an exploratory study into Aboriginal participation, I selected an ethnographic approach as a way to base my findings in the perceptions of those experiencing and facilitating participation. Data was collected primarily through confidential, semi-structured, individual in-depth interviews. Participant observation was used as a secondary research tool. Data was collected via audio recording (with prior consent) and note-taking.

Considering that research conducted in remote Aboriginal communities is tainted by a history of exploitation and miscommunication, I prioritised ethical approaches to gaining free, prior informed consent from participants. As Meadows (2009: 124) recommends, I invested time into knowing, being known and gaining authorisation in the community I was researching. Also, following Laverick and Brown's advice (cited in Liamputtong, 2010: 5), I adopted an approach of patience, courtesy, adaptability and willingness to learn.

Data analysis

In a qualitative data analysis process, recordings of the 13 interviews were assigned numerical codes, transcribed and read repeatedly, along with participant observation notes. Recurring themes were identified and categorised.

Given the limited scope of this study, focus on recurrent themes was prioritised over exploration of each individual participant's view. Categories were included only if addressed by multiple participants, or if featuring an opinion contradicting a view held by multiple participants. This was an attempt to account for outlier perspectives while also allowing for discussion of the major issues emerging from the study.

Results

This study presents its results in five sections: (1) motivations for participation; (2) co-creative distribution of labour; (3) facilitator-participant power dynamics; (4) perceptions of ideal participation; and (5) recommendations to improve participation. In communicating these results, I prioritise use of participant quotes. This is an attempt to allow participants to speak for themselves, and to provide insights into the way participants perceive the issues explored. Participant observations are only noted where they contradict, or add an additional perspective to, what was found in participant interviews.

Henceforth, I adopt the Warlpiri words *Kardiya* (non-Aboriginal) and *Yapa* (Aboriginal) to refer to participants. This reflects how participants refer to themselves and their cross-cultural colleagues within the interview excerpts displayed. To respect anonymity, participants are referred to as *Kardiya* participants 1 to 4 and *Yapa* participants 1 to 9. I elected not to allocate fake names, as this may cause confusion within such a small organisation and community.

Motivations for participation

Yapa participants revealed three key motivations to work at PAW Media. The first, and most commonly cited, was a sense that their work provided an important community service. *Yapa* participants spoke with pride about serving local audiences. *Yapa* participant 1 stated:

> I love going to work every morning, love doing things for our community … If we don't go to work, nothing gets done, we need to turn up for work every day.

Yapa participant 2 added:

> I like mostly talking on the radio and talking to my people. Yeah, the good thing I like is when people call us for a request. I know then that the community is listening … Providing a service for our people. It's really good.

A second motivator for *Yapa* media producers was enjoyment of the work atmosphere. *Yapa* participant 3 said:

> People are happy, you come to work, your workmates greet you in the morning with 'Good morning, it's a beautiful day.' Sometimes I come just to hang around with the other workers.

Yapa participant 4 had noticed the work atmosphere at PAW Media from a young age, stating:

> Ever since I was at school, I've seen a lot of people having fun here. I thought I might work for media because it's fun there.

A final factor motivating work participation for *Yapa* staff was enjoyment from the media production process. *Yapa* participant 5 said:

> I like listening to music, using the computer, looking at old stuff, doing video shots, working the panels on the [radio] desk. You get to do recording and editing. I'm really interested in it.

For *Kardiya* staff facilitating the participatory media process, there were two common motivating factors. The first was the opportunity to learn about, and work within, a different culture. The second was the chance to support and empower local staff. *Kardiya* participant 1 summed this up:

> Learning about the culture that we're working in is fantastic. Seeing engagement from *Yapa* is terrific. They're the two best things about it.

Co-creative distribution of labour

All study participants were asked to describe their own jobs as well as those of their cross-cultural, co-creative colleagues. PAW Media workers described a clear demarcation of tasks and responsibilities along cultural lines.

Both *Yapa* and *Kardiya* participants described the *Yapa* work as fitting into five key areas: (1) everyday media production (broadcasting/editing/recording); (2) generating or approving key creative ideas; (3) community liaison to organise media projects and ensure cultural protocols were met; (4) Aboriginal language-based tasks; and (5) providing cultural advice to *Kardiya* collaborators.

The *Kardiya* position within co-creative teams was attributed with more varied roles. These included: (1) technical media expertise; (2) training and helping *Yapa* staff; (3) coordinating large-scale projects such as feature documentaries; (4) day-to-day paperwork and administration; (5) tasks requiring written English literacy; (6) liaison with government and other organisations; (7) writing and acquitting grants; (8) delegating and coordinating work for *Yapa* staff; (9) filling in for *Yapa* staff when they were away; (10) tasks that *Yapa* staff did not want to do.

Despite the division of labour, *Yapa* participants were all quick to emphasise the cohesiveness of the production groups. *Yapa* participant 5 said:

> The job brings us together. Different colours, *Yapa*, *Kardiya*, Chinese. It's good to share dreamings, songlines.

Cross-cultural power dynamics

To explore power dynamics within collaborative teams, study participants were asked about generating ideas, addressing creative disagreements and their overall views on power-sharing.

Generating ideas

In this study, all participants spoke of an idea-generation process that prioritised *Yapa* input. Yapa staff all said they felt supported to pursue their creative ideas and interests. *Yapa* participant 2 stated:

> They [*Kardiya* staff] encourage us to make what we want to make. They're not giving us a piece of paper saying do this, do it this way … they're telling us to do it our way. And they help us with it.

Kardiya staff described their roles in terms of supporting *Yapa* ideas, while also making some creative contributions themselves. *Kardiya* participant 3 explained:

> Primarily it's trying to facilitate their [*Yapa*] ideas to make them a reality. So whatever their ideas are, are primary. And if there's something I see that can add to that, I'll put my two cents in.

With respect to their own ideas, *Kardiya* staff all said they would be prepared to concede if there was disagreement from *Yapa* colleagues. *Kardiya* participant 4 stated:

> I would explain my idea and why I thought it was good for the production but, ultimately, I would have to concede if I thought he didn't like my idea. Because it's a Yapa production and he's the *Yapa* worker, and if he has a problem with one of my ideas, I have to let it go.

Overall, study participants described *Yapa* collaborators as having more power than *Kardiya* collaborators in terms of generating and approving ideas. However, I noticed limits to this power. Although it was not mentioned in the interviews, I observed *Kardiya* staff also determining which ideas were supported. *Yapa* ideas that *Kardiya* staff did not like, did not have time for or felt did not fit within externally funded project guidelines were sometimes subtly sidelined. To some extent, for an idea to come into fruition, *Kardiya* and *Yapa* staff both had to support it.

Addressing creative disagreements

In dealing with creative differences, study participants all indicated that because PAW Media was an Indigenous media organisation, the *Yapa* preferences should be prioritised.

Yapa participants said they felt comfortable speaking up if they disagreed with a collaborator's decision or approach. *Yapa* participant 2 stated:

> I'd try to work with them, let them know that I don't like it.

I observed, though, that *Yapa* collaborators generally only felt compelled to speak up when they observed a breach relating to cultural protocol. More general creative differences of opinion usually were voiced only upon consultation. *Kardiya* participant 4 observed reluctance by *Yapa* collaborators to initiate conflict, explaining:

> I wish [*Yapa*] people would be more up-front and say no to things. I think [*Yapa*] people often find it hard to say no, so they just say yes and then stop turning up.

Generally speaking, *Yapa* participants had the upper hand with creative disagreements within cross-cultural teams; however, this power was strengthened when active consultation processes were in place, rather than when it was assumed that Yapa collaborators would speak up if they had a problem.

Power structures

Overall, *Yapa* staff described a balanced power dynamic featuring mutual respect and appreciation. *Yapa* participant 4 stated:

> A new *Kardiya* comes in with a blank mind. *Yapa* have worked in the community for most of their life so when *Yapa* are explaining to *Kardiya*, it's like giving the knowledge. And the *Kardiya* is giving the knowledge about what they've done before. So they're like equal in power.

From the *Kardiya* perspective, participants also referred to a mutual dependence within the production process. *Yapa* participant 4 stated:

> I think it's genuine collaboration. Many of our projects wouldn't be made without *Kardiya* producers, but also couldn't be made without the input of *Yapa* workers and the *Yapa* who contribute to the stories.

Overall, participants expressed a view that power was shared equally between *Yapa* and *Kardiya* collaborators; however, these equal power dynamics should not be considered fixed,

but rather as shifting over time, depending on the individual relationships, personalities, production frameworks and circumstances involved.

Perceptions of ideal participation

In order to understand whether and how improvements could be made in relation to Aboriginal participation, study participants were asked about their ambitions for ideal participation in the workplace. Here, *Yapa* and *Kardiya* perspectives differed significantly.

Kardiya staff shared a view that ideal Aboriginal participation was synonymous with *Yapa* workers taking control of all aspects of production, leaving *Kardiya* roles redundant. *Kardiya* participant 3 stated:

> I personally feel that if someone's coming here from a *Kardiya* world, or is Kardiya, their job should be to make their job irrelevant. So basically, by the time you leave, someone [*Yapa*] should be able to do your [*Kardiya*] job.

Kardiya participants voiced a level of disappointment that an autonomous Aboriginal model had not eventuated. *Kardiya* participant 4 stated:

> You always hope in these [*Kardiya*] roles that you're leaving a legacy, and when you go, [*Yapa*] people will continue to work as they have with you. I've really given the [*Yapa*] fellas I work with every opportunity to learn enough to be able to do these productions without me, but that said, when I went away there were several months where I wasn't there and nothing happened.

Kardiya participant 1 expressed a resigned view that an autonomous Indigenous model would be ideal, but was not currently feasible:

> Look, ideally it would be entirely *Yapa* [working at PAW Media] of course. But the reality is that *Kardiya* have the skills from the outside world that *Yapa* want … It's a necessary partnership, it's maybe not the ideal thing, but we just need to find ways to make it work best.

In relation to the nine *Yapa* study participants, only two expressed a desire to move towards a model of Aboriginal autonomy in the workplace. *Yapa* participant 1 stated:

> Well that's a dream of mine. That's what us *Yapa* mob got to do, work towards that, for Yapa to run the organisation how we want it run.

Yapa participant 2 shared this view, stating:

> It'd be good if it was all Aboriginals working, it'd be really good because we can show people of other communities, and towns around, that there's an Aboriginal organisation that's just run by Aboriginal people, no other workers.

The majority of *Yapa* participants, however, expressed a desire not to work towards an Aboriginal-only model at PAW Media, instead preferring to retain the co-creative teams. *Yapa* participant 5 stated:

> I prefer to keep going as it was before, *Kardiya* and *Yapa* working together.

A few reasons were given for this preference. *Yapa* participants said they wanted to continue learning new skills from *Kardiya* staff, and that they also generally enjoyed the cross-cultural company. *Yapa* participant 7 stated:

> It's important that we need *Kardiya* coming into the community, and they become like our family in the organisation. It's important we have *Kardiya* coming in to share their ideas and experience.

Participants also stated that by having *Kardiya* staff consistently in the office, *Yapa* staff members could be absent from work in order to participate in other cultural commitments. *Yapa* participant 4 said:

> Yeah, at least it's good to always have someone [*Kardiya*] to take over. For us *Yapa*, there's always something coming up, like cultural reasons and sorry business. Like ceremonies. We don't have a date, it just happens. We can't be here all the time at the desk.

Finally, a couple of *Yapa* participants also mentioned that without *Kardiya* staff as gatekeepers, local family disputes or obligations might interfere with appropriate allocation of work resources. In summary, although an Indigenous-only model was advocated by *Kardiya* facilitators, this lacked support from most *Yapa* participants. Instead, from a *Yapa* perspective, there was a strong, although not unanimous, desire to continue working within the current cross-cultural co-creative model.

Recommendations for improved participation

Yapa and *Kardiya* participants were asked about current barriers to Aboriginal participation, and how these could be improved within the current co-creative structure. The suggestions from all interviewees related to improving the facilitation skills and approaches of *Kardiya* staff, so they could best support local participation. *Yapa* participant 8 explained:

> We have no problem with *Kardiya* coming and working, just make sure they respect the community and can work with the community.

Language training

A key barrier to collaboration was the fact that *Kardiya* facilitators lacked local language skills. Most *Kardiya* staff only knew a handful of phrases in Warlpiri, and cross-cultural communication at PAW Media was carried out primarily in English. While most *Yapa* staff had good verbal English language skills, some said they still struggled to comprehend everything *Kardiya* staff said. *Yapa* participant 7 explained:

> The tricky things are the [English] words that are unexpected and that I can't understand. I go back to them and I try to understand, but sometimes I just can't understand.

Moreover, *Kardiya* staff recognised that limited local language comprehension restricted their cultural knowledge. *Kardiya* participant 3 stated:

> We have just got to learn language. It automatically gives us massive insights into the people we're working with. Because language is the key to how people think, operate and understand the world … I feel like it really should be part of our work, every week, with *Yapa* staff training us.

Cultural inductions

A second barrier to *Kardiya* staff facilitating participation was a lack of local cultural knowledge, particularly upon commencement of employment. *Yapa* participant 4 explained:

> Some *Kardiyas*, they don't understand *Yapa* way, *Yapa* law. Some *Kardiyas*, they're new, and they just come and they don't know what's going on. It's really different for them.

Kardiya staff all lamented not receiving more than a very brief cultural induction, and advised that this needed to be changed. *Kardiya* participant 4 said:

> I found it quite challenging not really having any training … not with the cross-cultural context.

Kardiya participant 3 added:

> I think it's essential that a more thorough cultural induction be implemented as part of our start of employment.

Multiple recommendations were made about what should be included in induction training. These were: (1) being taken out on country with an elder to learn about cultural protocols and local kinship systems; (2) spending time in other Yuendumu community organisations; (3) being given relevant literature to read; (4) being mentored by more experienced facilitators; and (5) being given clearer job descriptions.

Yapa participants also suggested that new *Kardiya* staff be encouraged to meet as many people in the community as possible upon arrival. *Yapa* participant 1 stated:

> The idea is to get to know the community, and respect the community, mingle with people, just talk. Share ideas. Tell us about yourself. What you do and what in the past you have done. That makes it easy for community to relate to you.

Project-selection guidelines

Many of PAW Media's projects involved funding or commissions from external agencies. At times, pressures such as deadlines and expectations of high production values created barriers for Aboriginal participation. Given that *Yapa* collaborators could often be absent from work due to competing commitments, *Kardiya* staff said they sometimes felt compelled to work alone to meet funder deadlines and expectations. *Kardiya* participant 3 explained:

> A lot of it is the pressure of delivery. Things actually need to get finished. If there are no *Yapa* around, *Kardiya* have just got to do it, regardless of what's going on.

Moreover, in order to meet deadlines, initial grant applications were sometimes rushed through without proper consultation or involvement of *Yapa* staff. This sometimes left *Kardiya* facilitators stuck finishing projects in which *Yapa* staff members were never interested. *Kardiya* participant 4 suggested:

> Maybe there should be rules—like no project should be conceived by a *Kardiya* staff member without significant *Yapa* involvement, or no funding should be sought for a project unless it is being driven by a *Yapa* staff member.

Advanced facilitation training

Kardiya staff interviewed in this study all had strong technical media skills and previous experience engaging with Indigenous cultures. However, none had received much formal facilitation or community development training. A few staff said it had taken them time to learn to step back in their collaborations to create space for local input. Both *Yapa* and

Kardiya study participants identified a tendency for *Kardiya* staff to rush or take over projects. *Kardiya* participant 4 said:

> I've seen other *Kardiya* facilitators take over and pretty much make productions themselves, then just tack a *Yapa* name on as director, which I think is really wrong.

Kardiya participant 3 added:

> We [*Kardiya*] like to control things, because there's risk involved; otherwise it could all go pear-shaped.

Yapa study participants also noticed over-zealous tendencies in some *Kardiya* staff. *Yapa* participant 6 said:

> They [*Kardiya*] are not always patient, but we need that patience to be there, to show cultural respect.

Staff retention

An overall barrier to Aboriginal participation at PAW Media was the high turnover of *Kardiya* staff. *Yapa* staff spoke of the strain of regularly saying goodbye to *Kardiya* colleagues and friends, then having to invest time in 'breaking in' replacements. *Yapa* participant 4 stated:

> Every year it's hard. I see friends going away. And then another one comes and it takes them time to get into it. I've seen that happening for 15 years, new people coming in. And I feel sad for the ones who left.

Kardiya staff also recognised that they became more effective in their roles over time. *Kardiya* participant 4 said:

> I feel I was a lot better at my job after being there for three years than just being there a couple of months … It takes a long time to understand how things work.

A couple of *Kardiya* staff named burnout as a contributing factor. *Kardiya* participant 3 said:

> Sometimes *Kardiya* staff get a bit of martyr syndrome. They feel like they need to burn themselves out. I've seen that happen, people being hospitalised because they just feel like they need to go to the 'enth degree.

Yapa staff said their *Kardiya* collaborators usually left because they missed friends and family. *Yapa* participant 7 explained:

> They probably get sad being here away from their mob. I think they need more time to spend with family, then they can come back here if they want.

Thus, while staff retention can be difficult to ensure, investigating options for extended leave and professional development could be worthwhile.

Discussion

This study explored Aboriginal participation within co-creative, cross-cultural production teams at PAW Media by examining the motivations, labour distribution, power dynamics, ideals and barriers related to that participation, as described by study participants. Overall, the cross-cultural working relationships found within the teams can be described as *reciprocal partnerships*. *Yapa* and *Kardiya* media workers had different roles and responsibilities, but

power and creative control were shared relatively equally. Both parties expressed mutual respect and appreciation.

It is important to note from the outset that this finding of reciprocal partnerships relied heavily on the individual approaches of the team members involved, rather than the structural set-up of the organisation. Considering the cross-cultural division of labour found at PAW Media, alongside the wider (largely non-Aboriginal) political and economic structures within which RIMOs exist, it would be unsurprising to find lower levels of Aboriginal participation exercised within similarly structured teams comprising different individuals. Structural limitations were recognised by *Yapa* and *Kardiya* staff, and their recommendations to protect and improve participation will be discussed shortly; however, the existence of reciprocal partnerships will first be addressed.

Earlier, I identified two possible ways to evaluate participation. The first was to refer to popular academic models grounded in Western democratic norms, such as Arnstein's (1969) ladder. The second was to evaluate participation by considering its value as dependent on the world-views of participants. Participation through reciprocal partnerships is considered differently depending on which evaluation method is used.

With regard to Arnstein's (1969) ladder, partnership represents the third best of eight types of participation (1969: 217). Partnership is ranked only below delegated power and citizen control (1969: 217). In other words, partnership is a good form of participation, but it would be better if *Yapa* participants had more autonomy within the relationship. Through a mainstream lens, this is a clear and helpful analysis: we know where we are in relation to other types of participation, and what better forms or participation would look like.

Using the second, more context-specific, evaluation approach, attending to participants' own world-views, Aboriginal participation at PAW Media can also be seen as valued. In Warlpiri communities such as Yuendumu, obligation-based roles and responsibilities to land, law, ceremony and family are of central importance (Pawu-Kurlpurlurnu, Holmes and Box, 2008). Within this context, *Yapa* media workers valued their participation as a means of providing a community product to local audiences. They were proud to be supporting local language, stories, knowledge, music and culture. Here, participation was less about exercising individual power, and more about performing a role within the larger community. Reciprocal partnerships with *Kardiya* staff were perceived as a generally effective, enjoyable means to achieve this valued participation. So far, therefore, there is little to suggest anything except a positive, valued form of Aboriginal participation within the co-creative structure at PAW Media. To position this within a contextual evaluative framework, I will shortly discuss how these lived experiences compare with participants' perceptions of ideal participation, but first a few points should be made.

As an aside to the previous paragraph, I do not wish to suggest that communities such as Yuendumu represent a static, insulated form of a traditional Aboriginal culture from which to evaluate participation. In Yuendumu—like anywhere—culture is evolving and being shaped by various factors. Western influences exist alongside—sometimes in competition with—Warlpiri norms. Nonetheless, the Warlpiri cultural context remains important for understanding participation in this study.

The finding of valued participation at PAW Media is noteworthy partly because of the low socio-economic status of remote Aboriginal communities such as Yuendumu. Remote

community members are less likely to participate in employment or education than other Australians, while issues like domestic violence also negatively impact participation in community life (AIHW, 2015). This suggests valued Aboriginal participation at PAW Media was not just an incidental occurrence as part of wider trend in Yuendumu, but rather a specific and meaningful phenomenon.

The experiences of valued Aboriginal participation at PAW Media documented in this study depended to a significant extent on reciprocal partnerships within a co-creative production model involving *Kardiya* collaborators. Examination of the distribution of labour within teams revealed a reliance on, or preference for, *Kardiya* staff to carry out key tasks. This idea fits theorising of co-creative media as a process enabling participation by allowing facilitators to 'bridge participation gaps' (Spurgeon et al., 2009: 276). This is not to say that valued Aboriginal participation could not also be possible under alternative production models, just that the experiences documented in this study were enabled by co-creative practice.

So far, my discussion has looked at conceptually evaluating Aboriginal participation in its current form at PAW Media. I now turn to considerations of how best to improve participatory practice within the context of the case study. Here, the notion of ideal participation, as perceived by participants, becomes important for creating a benchmark against which to compare current practice.

Despite finding value in the current state of Aboriginal participation at PAW Media, many study participants saw room for improvement. However, significantly, there was a lack of consensus on what an ideal model of participation looked like, and thus what they should be working towards. *Kardiya* staff and a couple of *Yapa* staff supported a future shift towards a more autonomous model of Aboriginal participation at PAW Media. They imagined media production where labour and responsibility were in Aboriginal hands, without non-Aboriginal influence. Yet most *Yapa* study participants rejected this option, instead preferring to retain the collaborative, cross-cultural teams in which they worked within the co-creative model—albeit, importantly, with some improvements.

Having *Kardiya* facilitators working towards an independent Aboriginal model of participation, without the support of the majority of *Yapa* staff, is likely to be problematic. If facilitators are trying to hand over jobs and responsibility to unwilling *Yapa* staff, this may actually lead to disengagement and a weakening of Aboriginal participation. Further, *Kardiya* staff may feel frustrated about their failure to realise their ideal model of participation, and question their role in being there at all.

The support from *Kardiya* staff for a more autonomous Aboriginal participation model was hardly surprising. Coming from non-Aboriginal Australian communities, they were likely to share the Western democratic ideals that promote participant autonomy as an ideal form of participation. In keeping with logic advocated in Arnstein's (1969) ladder, *Kardiya* staff felt this would strengthen Aboriginal participation because *Yapa* media workers would no longer have to share power or creative influence with non-Aboriginal parties. Nonetheless, given that the desire to move towards an autonomous model was challenged by many Aboriginal participants, it would be beneficial for *Kardiya* staff to factor this into informing their facilitation approaches.

Most *Yapa* participants perceived their participation as being better served under a cross-cultural, co-creative production model, and found benefits in employing Kardiya collaborators.

Yapa staff members were not forced to be involved in every aspect of the production process, but could have more freedom to choose how and when to participate. By sharing labour with *Kardiya* staff, they felt better able take time off from work to participate in other family and cultural commitments, knowing day-to-day media operations would continue without them. Overall, as a trade-off for sharing power with *Kardiya* collaborators, *Yapa* workers had more flexibility in choosing the nature of their participation. In addition, Yapa staff generally enjoyed the personal relationships formed through cross-cultural collaboration, as well as valuing the skills, technical expertise and resource management to which they had access through employing outside professionals.

I note that the finding of *Yapa* staff preferring a co-creative model may have been influenced by the fact that I, the researcher, was a former *Kardiya* facilitator. *Yapa* participants may not have wanted to cause offence by voicing a preference for *Kardiya* staff to leave. However, I believe this risk was minimal, as I approached the topic in broad terms during interviews, in reference to the distant future, and because participants gave reasoned answers justifying their positions.

Despite overall satisfaction with the state of affairs at PAW Media, study participants recognised that the current dependence on *Kardiya* staff did limit, or had the potential to limit, Aboriginal participation. If a *Kardiya* staff member was ineffective in their position, this could lead to disengagement from *Yapa* collaborators, and to a situation where a *Kardiya* staff member was left to create Aboriginal media products with very little Aboriginal input. Even for *Kardiya* staff who were suited to their facilitation roles, limited local language skills and cultural knowledge restricted their capacity to facilitate Aboriginal participation—especially upon recent commencement of employment. Thus, in supporting the current dominant *Yapa* view of ideal Aboriginal participation within a co-creative framework, recommendations made by study participants should be considered. These recommendations relate to improving *Kardiya* skills and approaches in terms of: (1) local language; (2) cultural knowledge; (3) project planning; (4) facilitation; and (5) employment longevity.

In prioritising the views of *Yapa* participants, this study proposes a process for improving Aboriginal participation by refining the current co-creative structure. However, the opinions of two *Yapa* participants who supported a shift towards a more autonomous Aboriginal model of participation should not be disregarded. Just because this model was not desired by most *Yapa* study participants at PAW Media does not mean this will not change in the future, when the topic should be reconsidered. It is possible that the default opinion to continue with a co-creative model was in part due to convenience and familiarity with the status quo—a situation from which participants may eventually wish to move away.

Furthermore, by proposing a refined co-creative production model at PAW Media, I do not deny the troubling structural cross-cultural dependency that will continue to perpetuate. The question with which remote Indigenous organisations such as PAW Media have to grapple is whether the benefits of working within a cross-cultural, co-creative structure outweigh the downsides of an ongoing dependency. An alternative structure is surely possible, but would fundamentally change the current model, which is able to capitalise on non-local facilitation, technical expertise and connections with Australia's wider media industry.

Given that, at the time of this study, the model of production collectively preferred by *Yapa* workers at PAW Media was one of cross-cultural collaboration, this should be respected

and supported. The co-creative workforce dynamics should be transparent, monitored and strategically supported to support maximum Aboriginal participation within this model.

Limitations

The research outlined in this article should be read as attempting to build a conceptual frame for examining the cross-cultural, collaborative relationships within a co-creative production model, and using that as a basis for addressing questions of participation, power and collaboration. The qualitative findings presented must be understood in the context of a short and small-scale research project, and are therefore not generalisable or transferable. However, the conceptual framework and method used in this study are transferable. Via their transfer, findings from this study could be tested and refined as part of a larger effort to understand, evaluate and improve participation in co-creative media practices, both within and outside the remote Indigenous media sector.

Conclusion

This article outlines findings from the first qualitative research to explore the lived experiences of Aboriginal participation in cross-cultural, co-creative production teams working in a RIMO. As a case study, it looked at PAW Media, a RIMO based in the remote Northern Territory community of Yuendumu. Through 13 in-depth interviews, grounded in participant observation, the study revealed valued experiences of Aboriginal participation at PAW Media. This participation was facilitated through a co-creative production model with Aboriginal and non-Aboriginal collaborators sharing power relatively equally, working in reciprocal partnership.

The significance of this study can be found in both its policy recommendations and its theoretical contributions. In terms of practical benefit, this research demonstrates how participation in co-creative media can be understood, evaluated and subsequently improved. The research examined how *Yapa* producers at PAW Media conceptualised an ideal form of Aboriginal participation, and documented recommendations to help achieve this ideal. The overarching vision for local Aboriginal participation expressed by *Yapa* study participants was one that broadly retained, yet modified, the current co-creative production model. Particular recommendations were made to improve the language skills, cultural knowledge, facilitation abilities and project development approaches of *Kardiya* collaborators.

In reaching this understanding of what an ideal model of Aboriginal participation looked like, as perceived by most *Yapa* participants, it was interesting to note that it conflicted with ideals held by *Kardiya* collaborators. Here, *Kardiya* producers envisioned ideal participation in Aboriginal media production as being an Aboriginal-only affair, existing separately from non-Aboriginal influence. In finding that this ideal was rejected by most (although not all) *Yapa* participants, there is an opportunity for *Kardiya* producers to reconsider their roles in facilitating Aboriginal participation. This does not mean that ideas for alternative models should be disregarded, but that an active process of regular dialogue regarding goals and directions for Aboriginal participation should be engaged in.

In contribution to theoretical debates, this research illustrates an alternative approach to exploring participation by considering it a concept and practice best evaluated by positioning it within the context of participants' world-views. This approach was adopted alongside more traditional academic models for evaluating participation, which are highly valuable in reminding us that participation is linked to power. Used in isolation, traditional models, with their tendency to champion Western democratic ideals, can be problematic in terms of accounting for participation in the largely non-Western context of a remote Aboriginal community. Here, ideas relating to obligation and community service must be considered as contributing to participant perceptions of what constitutes valued participation. This research found mainstream understandings of participation, which idealised maximal participant control, were strongly reflected in the views of *Kardiya* study participants, but emerged less in the views of their *Yapa* counterparts. Instead, the alternative theoretical description of co-creativity was more reflective of *Yapa* thinking on ideal participation in the PAW Media workplace.

Opportunities exist for future studies to advance understandings of participation and co-creative production in community and Indigenous media. In relation to PAW Media, it would be beneficial to further investigate the recommendations presented in this study to develop a practical training program and/or resource. At a broader level, future research could examine participation within other Indigenous and non-Indigenous organisations using co-creative media practices. Ideally, these studies could be of a broader scope, considering the organisational and structural factors at play. These studies could look at how participation is affected by internal and external stakeholders such as managers, board members, funding bodies and government policy-makers.

Acknowledgement

A travel grant for this research was awarded by the University of Queensland Centre of Communication and Social Change. The author wishes to thank the staff of PAW Media and Communications for sharing their knowledge, experiences and time to make this study possible.

CHAPTER 25

Participatory Film Production as Media Practice

Antoni Roig Telo

International Journal of Communication 7 (2013): 2312–32.

Abstract

This article uses a practice theory perspective to study new media creation through the case of participatory film production. Although a growing body of practice-related literature addresses user-generated content or online creative communities, the engagement of collectives in the development of complex long-term creative projects like movies or transmedia has received less attention. Sometimes these are commercial projects generating communities for profit, sometimes actual cocreative or community- generated projects; either way, practice theory proves useful for observing and identifying expectations, motivations for engagement, intrinsic rules, tacit normativity, and routinization as well as innovation, compromise, and negotiation between the creative agents involved, particularly in a project's early stages. This article presents an overview of practice theories connected to media production and discusses them in relation to actual cases of participatory filmmaking.

Keywords

participation, practice theories, media production, participatory filmmaking

Introduction

There's Something About Practices . . .

Practice has become a common keyword in the academic study of culture and media. This recourse to practices happens for different reasons, but it mainly addresses "what people do to media" or, particularly relevant in this article, "what people are making together in relation to media." This perspective forces attention away from texts or structures onto what people are actually doing, or at least what they say they do (Couldry, 2011).

A sort of practice approach has thus come to the fore in digital media research. Although rarely elaborated (I will treat the theorization of practices below), the notion of practice is often at the core of current definitions of media and culture. To name just a few examples, Gitelman (2007), discussing the newness of new media, defines the communicational dimension of media as a cultural practice. Jenkins adopted this definition to refer to media as cultural systems—"layers within an ever more complicated information and entertainment stratum" that are thus differentiated from technological delivery systems (Jenkins, 2006, pp. 13–14). Subsequently, Jenkins (2010) applied the expression "clusters of practices" to creative communities in DIY media production, indicating the significant role the notion of practice acquires in debates on media literacy, expertise, social learning, and shared knowledge, where it contributes to understandings ranging from "affinity spaces" (Gee, 2007) to, more explicitly, "communities of practice" (Wenger, 1998). Furthermore, Dena (2010) labeled her approach to transmedia design and production "transmedia practice," drawing on Kress and Van Leeuwen's (2001) semiotic notion of domains of practice, which distinguishes between four different domains of meaning-making in multimodal texts: discourse, design, production, and distribution. Finally, Carpentier's (2011) study of media and participation emphasizes the importance of practices and communities when discussing the role of organizations (and their alternatives) in media production. To summarize this practice approach, I refer to Hills' definition of culture as a

> series of spatially and temporally bounded, but still everyday, practices through which self-identity is generated against 'mainstream' or 'parental' others. Culture in this definition amounts to routinized ways of doing things and ways of thinking about the world that work to define a specific, substantial community against other groups. (Hills, 2005, p. 15)

As I will show, this last quote is already introducing certain key features of practice theory.

. . . and About Participation

A practice approach to the study of media and culture, as introduced above, seems particularly useful in a context of expansive cultural productivity at all levels. One of the most popularized expressions referring to this environment is "participatory culture" (Jenkins, 2003), defined in terms of "low barriers to artistic expression and civic engagement, strong support for creating and sharing one's creations . . . informal mentorship members [who] believe their contributions matter, and feel some degree of social connection with one another" (Jenkins, 2010, p. 238). However, Jenkins' position has generated controversy about the actual scope of participatory culture, its interdependences with established media power structures (Deuze,

2008), and his own conceptualization of participation (Fuchs, 2011a, 2011b). As Deuze states, not all participation is the same, nor is it equally distributed across user groups or media forms:

> [M]uch of this participatory culture is heavily regulated, constrained or embedded within company processes and practices that strive to "harness" rather than "unleash" participation Thus, the role participation plays in the media industries' move online can be seen as an expression of the convergence of production and consumption cultures as well as in the corporate appropriation of the technology. (Deuze, 2008, p. 31)

An example of this observation is the extensive use of the term "crowd" as an all-purpose tag to refer to any kind of collective engagement in processes of media production. As I will demonstrate, popular "crowd" terms in media, like crowdsourcing and crowdfunding, do not encompass the diversity of creative practices involved in participatory media production and often, in fact, do not count as participatory at all (see Literat, 2012; Roig, Sánchez-Navarro, & Leibovitz, 2012). Controversies aside, in this article the notion of participatory culture is relevant for highlighting participation as the key feature of contemporary cultural production.

This article is organized as follows: Having already outlined some preliminary considerations regarding practice and participatory culture, I will introduce my specific area of study, that is, participatory creative projects. I will then proceed to focus on the theorization of practice, and particularly on the elements that are most relevant to research on media production. Subsequently, I will illustrate the application of this practice perspective in two specific cases of community-based filmmaking projects: *A Swarm of Angels* (UK) and *Star Wreck/Iron Sky* (Finland). Finally, I will offer some concluding remarks on the potential and challenges of participatory media production through the lens of a practice theory perspective.

Participatory Creative Projects

A growing body of practice-related literature addresses user-generated content and online creative communities, but engagement in participatory media projects has received little attention. Their emphasis on human activity and creative communities—or collectives—underlines the potential of a practice approach to the study of participatory forms of media production. As the case analysis section will show, complex social interrelations emerge around collective involvement in these long-term, demanding cultural enterprises. Thus it is easy observe how individuals develop strong affective ties to projects they feel personally related to, either as socially engaged citizens (as in some participatory documentaries) or as media enthusiasts (as in some fan-related movies or crowdsourced films). Some noteworthy examples from the former category are *The Age of Stupid* (2009), *Collapsus* (2010), *Prison Valley* (2010), *Highrise* (still in development) or *Life in a Day* (2010); the latter includes, to name only a few, *Star Wars Uncut* (2010) and its "sequel" *The Empire Strikes Back Uncut* (2012), *The Cosmonaut* (2012), *Iron Sky* (2012), and *Lost Zombies* (2012). Technologies and platforms for media creation, collaboration, and distribution are of course instrumental in this expression of participatory culture, as are the social and cultural values assigned to digital creativity, particularly when it relates to film and television production. Many calls for participation therefore take the form of an invitation to be part of something unique that has traditionally taken place "behind closed doors," leading to overambitious statements that entice participants to "make history," to

become "coproducers" or "codirectors," or to feel personally—if vicariously—connected to celebrities (e.g., Kevin Spacey, Paul Verhoeven, Ridley Scott, or Lars von Trier).

Beyond rhetoric, delimiting the notion of participatory creation is no easy task, not least because of the inherent complexity of "participation" itself. Creative practices like filmmaking are necessarily complex, expensive cultural endeavors dependent on the collaboration of different creative agents. In this context, it is entirely unsurprising that not all "calls to participation" are genuine (many are actually not). Taking elements from Jenkins' cultural approach, but also from participatory democratic theory (Carpentier, 2011; Pateman, 1970) and participatory art (Bishop, 2004; Literat, 2012), I define participatory creation as opening some decision-making processes to a loose collective of participants who gain recognition as practitioners through their engagement in a creative practice.

Many implications derive directly and indirectly from this broad definition; they are summarized below in Tables 1 and 2. Concerning a project's initial stages, it is key to note that a participatory project can be either the task of a creative core team (what Literat calls the "alpha artist") or the self-organizational effort of a community. Therefore, participatory projects are not at odds with specific expressions of leadership and creative vision from a core team. Moreover, enrollment should be unrestrictive and practitioners mostly self-selected through a personal compromise of engagement.[1] This also implies that a call for specific expertise is neither a requirement for nor an obstacle to considering a project participatory, although most participatory projects are open to a broad range of enthusiasts with different backgrounds and talents.[2] It is also crucial to note that participatory projects tend to appear connected to broader social and cultural phenomena, like social activism, free culture movements, games, or fandom. Meanwhile, one must not overlook the fact that participatory discourses have also been co- opted by brands and media companies. All these social, cultural, and economic connections shape the "constitutive rules" of the practices of participatory creation of media products.

As for development, participatory projects tend to offer clearly defined goals and milestones across their different phases. Their most important feature may be their inextricable connection to decision making, that is, their distribution of creative control, which in turn implies the existence of spaces for negotiation and debate. From this key starting point, different degrees of participation become identifiable on a spectrum from minimization to maximization of participation (Carpentier, 2011). It follows that a participatory endeavor implies transparency and mutual recognition among participants (Deuze, 2008), and that to ensure such relations a participatory project should promote communication not only between the creative core and the rest of participants but among all practitioners. Thus participatory projects tend to foster specific creative communities based on collaboration, leading to mutual support networks (following Jenkins, 2010, p. 233). Transparency also means that participatory creative projects tend to release tools and resources as means of instrumental productivity (Wirman, 2009)—in other words, these projects open their own

[1] "Gated membership," in which enrollment in a participatory process is tied to a (usually monetary) contribution, has been a contentious issue.

[2] According to this specification, Blender movie projects, which aim to produce films experimenting with the possibilities of the open-source creative tool Blender, are not considered participatory filmmaking, as they select only a small number of participants from among the most skilled members of the Blender community and proceed under tight creative control.

procedures to help others acquire know-how and use it in other projects. By incorporating the aforementioned elements, participatory projects tend to develop strategies for ensuring the continuity of the practice over time, beyond the scope of a particular initiative.

Certain additional features frequently connected to the notion of participatory projects can indeed constitute a valuable contribution but should approached with some caution for purposes of analysis. First, asking people to contribute to a project (in terms of labor or money, even if rewards or tokens are given in exchange) is an insufficient condition of participation. Thus crowdsourced or crowdfunded projects are not necessarily participatory (Roig, Sánchez-Navarro, & Leibovitz, 2012), although some crowdfunded projects that transcend a mere reward-for-money system can foster a meaningful creative relationship between supporters and the creative core, which could be analyzed in terms of the elements mentioned above. On the other hand, releasing a creative project under an open license allowing appropriation and remixing is also insufficient, unless it is an integral part of a participatory project. In view of the previous statements, it must also be said—contrary to some widespread discourses, and despite the importance of engagement—that just making people feel part of the project is not a sufficient condition in itself; nor is engaging people in a multimodal experience, as in a transmedia project (which is not to deny the potential of the combination of transmedia and the participatory).

Furthermore, cocreation, understood as an agreement between a promoter entity and a collective of engaged users to contribute specifically to significant parts of a creative project, shares many features with participatory projects, mainly decision making, transparency, and mutual recognition (Banks & Potts, 2010; Deuze, 2008). However, cocreative projects may involve restricted membership and also require certain tangible user-driven outcomes, which have further implications for the meaningfulness of contribution, ownership, and rights. These projects can thus differ considerably from strictly participatory projects. Finally, all these strategies for opening creative processes should—at least ideally—result in different kinds of cultural products and at the same time have a social impact, encouraging further initiatives to explore alternatives and advances in cultural production.

The following tables summarize my position regarding participatory projects. Table 1 assembles the key contributory focal points for analysis of participatory projects, which influence the set of conditions depicted in Table 2. This second table establishes a distinction between "necessary conditions" for considering a creative project strictly participatory; "ideal conditions," which are not necessary but are seen as desirable; and "related conditions," which embody some popular notions that can be identified in some participatory projects but also can lead to misconceptions, as they do not constitute a sufficient condition in themselves.

Table 1. Contributory Focal Points in Participatory Projects.

Contributory focal points	Project goals, outcomes, and milestones
	Leadership and power relations
	Promoters and backers
	Degrees of expertise required
	Means of distribution
	Broader social, economic, and cultural connections
	Construction of affective engagement with the project

These tables offer valuable insight into the main features of participatory creative projects. However, such a project must not be taken as an "either/or" logical proposition. There is a gray area where projects that could in essence count as participatory become identifiable despite the near absence of some necessary conditions. I will show this to be the case in *Iron Sky*, where distribution of creative control was arguable, at the very least.

Now that I have introduced this article's main concepts—the practice approach and participatory projects—I will present an overview of theories of practice that will serve to analyze participatory phenomena.

Practice in Theory

Practice is indeed a very abstract, ambiguous term. Despite its wide use, or maybe because of that, it tends to be taken for granted, leading to conceptual misunderstandings. First, it is important to recall two different common meanings applied to the word practice: the actual execution of a plan or method (i.e., as opposed to theory) and the "customary or expected procedure or way of doing something" (Oxford Dictionary of English, 2010), which is usually applied to describe specific fields of professional activity (what we call professional practice or praxis). Taking this second meaning further, practices emerge as the more elemental components of the social. On this basis, this article adopts a preliminary, simplified consideration of practices as sets of interconnected and routinized everyday activities carried out by human agents. This section will treat the notion of practice and the ways its theorization contributes to better understanding of participatory projects.

Approaching culture and society as practices is nothing new. This intellectual interest is traceable to essential 20th-century philosophers and sociologists, from Durkheim (1915), Heidegger (1962), and Wittgenstein (1968) to Bourdieu (1977), Foucault (1979), Giddens (1979), De Certeau (1984), and Turner (1995). Their important contributions have helped to shape a more specific theoretical and methodological corpus on social practices. These theorizations of practice are identifiable in different branches of social theory, from cognitivism to Marxism and functionalism, which all locate everyday practices at the very center of sociality.

Postill (2011) adopts the term practice theory to refer to the work of a "second wave" of practice theorists in social science, particularly Schatzki (1996), whom Wittgenstein's conceptualization of practice influenced deeply. Indeed, Schatzki has been influential in the shaping of a culturalist approach to practices, evident in the work of contemporary authors in the fields of consumption (Moisander, Könkkölä, & Laine, 2012; Warde, 2005), social theory (Reckwitz, 2002; Swidler, 2001), philosophy of science (Knorr-Cetina, 2001), or media studies (Ardevol et al., 2011; Couldry, 2011). This article uses this interdisciplinary body of work on practices as a theoretical and methodological tool in the study of contemporary cultural production. To this end, I will use practice theory as a conventional denomination, while acknowledging that there is no unique approach to the theorization of practices.

Drawing from Schatzki's conceptualization of social practices (1996), Reckwitz offers a concise definition of practice as a

> [R]outinized type of behaviour which consists of several elements, interconnected to one other: forms of bodily activities, forms of mental activities, "things" and their use, a background knowledge in the form of understanding, know-how, states of emotion and motivational knowledge. A practice—a

> way of cooking, of consuming, of working, of investigating, of taking care of oneself or of others, etc.—forms so to speak a "block" whose existence necessarily depends on the existence and specific inter-connectedness of these elements, and which cannot be reduced to any one of these single elements. (Reckwitz, 2002, pp. 249–250)

More specifically, Schatzki refers to an organized set of bodily and mental activities that form an inextricable assemblage—constituted by understandings of what has to be done and what has to be said, the rules or instructions that regulate them, and the teleo-affective structures that orient them—that is an emotional component of satisfaction and desire (Schatzki 1996, p. 89). More simply, three identifiable main components lie behind all practices, if to different extents: understandings related to the practice, explicit rules (or procedures) of the practice, and finally, affectivity (motivations, emotions, goals, beliefs, moods, engagement) linked to the practice (Schatzki, 1996, p. 89; see also Reckwitz, 2002, p. 250; Warde, 2005, p. 134).

Schatzki distinguished two main types of practices: dispersed practices and integrative practices. Dispersed practices—simple practices scattered across social life—are characterized as sets of doings and sayings oriented mainly to social understandings. Such practices include explaining, describing, asking, examining, greeting, obeying or supposing. Schatzki insists that dispersion does not mean isolation; thus a dispersed practice can help constitute another, for example, asking in relation to replying. On the other hand, integrative practices constitute particular domains of social life. Some examples are agricultural, culinary, educational, or filmmaking practices. Schatzki does not regard integrative practices as mere collections of dispersed practices, since the latter are often transformed upon becoming part of an integrative practice. For instance, the dispersed practices of asking and replying are overtly transformed when they become part of educational practices. Moreover, an integrative practice can become part of, or be tightly linked to, another integrative practice (like filmmaking and play in relation to machinima, which can be broadly defined as the production of linear audiovisual content from a computer-generated virtual environment, such as a videogame or a virtual world).

Integrative practices are useful in identifying both differences and connections between different meanings of the term practice. Thus, the more abstract notion of practice as opposed to theory is commonly used to embody the whole set of capabilities that make up the appropriate way to carry out a specific professional activity (i.e., praxis), as is obvious in highly regulated fields like law, psychology or medicine but equally applicable to any kind of complex practices, like those belonging to the field of cultural production. Therefore, any complex practice can be seen as a domain of social life—a set of interconnected practices subject to explicit rules and regulations, as well as implicit rules that shape what is considered the "right" way to do things in specific contexts. This "right way" defines normativity, hierarchies among participants, and expectations, and once a practice is established it tends to be tacitly accepted as natural. This article will show how the observation of emerging practices is crucial in participatory projects' early stages, when participants are negotiating meanings related to hierarchies, internal organization, relationship with other cultural domains (i.e., free culture movement, fandom), leaderships, and affective ties.

Consequently, practices are neither strictly established nor stable. Instead they are socially and culturally constructed, and governed by rules both explicit and implicit. Moreover, a complex practice that is deeply interrelated with other domains of social life, as also stated

in Bourdieu's theory of fields,[3] is at the same time constituted by other practices ranged on a continuum from elemental dispersed practices, like asking questions or interpreting data, to more specific integrative practices like design, postproduction, financing, or marketing. Finally, a practice approach holds practitioners to be those who are "enacting" the practice. This means acknowledging all the agents involved as participants, that is, professionals and users alike.

Practices and the Everyday

Most theoretical approaches emphasize the routine, ordinary dimension of practices. In an accurate summary of the more orthodox conceptualization of practices, Christensen and Ropke (2011) offer the following criteria for identification:

- Bodily-mental activities (individual and social interactions) are routinized and repetitive.
- Activities incorporate components such as understanding, know-how, states of emotion, motivational knowledge, and usually also objects, which are all interconnected.
- Interconnected activities and components are perceived as meaningful entities in a given society or culture. (Christensen & Ropke, 2011, p. 238)

This emphasis on routine explains why debates on media practices tend to focus on mainstream media consumption and sometimes overlook transformative practices related to media, like remixing or cocreation. Bearing in mind that social practices are everyday and usually routine, researchers need to consider how people engage in creative practices, that is, how they deal with a complex object that is not, at least at first, routine. Knorr-Cetina (2001) adopts a practice approach to explain interaction with non-routinized objects through what she calls object-oriented or creative practices. For Knorr-Cetina, this situation entails a complex unfolding object in a brand-new situation, be it a scientific object of study, a technological device, a body/mind technique to be mastered, a cultural object like a video game, or a media project. This interaction generates new practices to overcome the challenge. Knorr-Cetina is not suggesting that routinization and repetition leave the picture—both are essential to this process of domestication. But these kinds of practices also hold plenty of room for creativity, improvisation, self-improvement, frustration, pleasure, and affective engagement. Overall it seems that in these creative practices, the practitioner is trying to achieve the psychological balance between competence and challenge that Csikszentmihalyi (1996) calls *flow*, a state typically used to exemplify our engagement (and disengagement) with games.

Organization of Practices

Practices are internally organized through three main components: understandings, procedures, and affectivity. This third component justifies interest in practices from consumption

[3] Bourdieu defines fields as specialist domains of practice with their own logic that are constituted by a unique combination of species of capital; for example, financial capital, symbolic capital (prestige, renown) or social capital ('connections'). . . . [In a field] . . . differently positioned practitioners compete and cooperate over the same prizes and rewards: money, pleasure, recognition and so on. . . [Furthermore, some fields have] . . . tangible effect on other fields." (Bourdieu in Postill, 2011, pp. 7–8, 16)

studies (Warde, 2005). A practice analysis should thus consider motivations for engagement, affective relations and beliefs associated with the practice and expected rewards.

Practices are also interconnected, necessitating interrogation of the external organization of practices and power relations. Swidler (2001) argues that some practices anchor, control, or organize others, pointing to a possible hierarchy among practices. For Swidler, the power of these anchoring practices lies in their bond to constitutive rules, that is, implicit rules that stay in the background yet are essential to define what the practice is about and thus produce normativity. Although determining the extent to which some practices can control others via implicit rules is highly problematic, certain anchoring practices and constitutive rules are identifiable and empirically observable, particularly in early stages of the practice and in moments of conflict and change. In such moments, participants' different motivations and expectations can collide, leading to conflict but also to negotiation to try to restore a shared vision of what the practice means for its participants.

Reproduction and Innovation

Notably, though practices have been regarded merely as "repeated ritual confirmations that something is indeed what it is" (Swidler, 2001, p. 89), they llend themselves to both reproduction and innovation. As Warde (2005) graphically describes, a set of established understandings, procedures and objectives exists in a practice at all times, acting as formal and informal codification that governs and conducts the practice, often without much reflection or conscious awareness on the part of participants. It constitutes the basis for reproduction of the practice, accounting for its considerable inertia through time. But at the same time,

> performances in the same practice are not always the same. . . . Conventions will usually be to some degree contested, with some practitioners typically still attached to prior codes of conduct, while others, perhaps of a new generation, seek to replace current orthodoxies with new prescriptions. . . . Practices also contain the seeds of constant change. They are dynamic by virtue of their own internal logic of operation, as people in myriad situations adapt, improvise and experiment. (Warde, 2005, pp. 140–141)

Like Knorr-Cetina's notion of object-oriented practices, Warde's work acknowledges that practices, though everyday and inertial, are not necessarily routine, homogeneous, repetitive, or stable through time.

Practice Theories in Practice: The Case of Community-Based Participatory Film Production

This section will outline some results of research on participatory forms of film production using practice theory as a theoretical-methodological tool. The research examined practices taking place in participatory environments where a community is fostered or forms informally around the development of a film project. Of particular interested were how the interrelation between different roles like "producers" and "audiences" changed, and how processes and their outcomes could configure an alternative to traditional production models. We selected two groundbreaking case-examples of participatory filmmaking: the British open-source film

project *A Swarm of Angels*, and the trajectory of the Finnish collective Energia Productions, promoters of the fan film parody *Star Wreck* and the science fiction comedy feature *Iron Sky*.

To gain thorough insight into the cases, the research devoted special attention to the early stages. Then, practice is less routine and normative, or undergoing change, which facilitates observation of the external organization of practices and their implicit rules. Thus each case was approached as an organizational form, that is, part community but also alternative organization (Carpentier, 2011, p. 221–222). All its public manifestations, from websites to blogs, press, specialized forums, social media and offline events, were observed. Official sources, which represent the perspective of the creative core, and unofficial sources received equal attention. Once this framework was established, the focus turned to the organization of practices in participation spaces: structure of discussion threads, processes of decision making and meritocracy, emergence of recognized members, statistics on actual participation, identification of different domains (community organization, project development, content production, and promotion), and contributions to the creative community. From there, it became possible to outline a set of practices and identify the key features of its production model.

After briefly presenting both cases, the next section will discuss them in the light of practice theory and contrast the results with the wider proposal of conditions for participatory creative projects.

A Swarm of Angels (UK)

A Swarm of Angels (*ASoA*) is a film project promoted by digital entrepreneur Matt Hanson. Set up in 2006, it aimed to build a community for the collaborative development of an open-source science-fiction movie from scratch. Collective action to redefine filmmaking production processes was therefore considered as important as the final product. After two years of intense activity, in 2009 *ASoA* went into hiatus—though it was not officially canceled—after working on two screenplays, designing different visual concepts, and experimenting with participation strategies, like releasing a teaser or fostering a user-generated documentary on the community. Registered members of the community called themselves Angels, and a playful appropriation of the Christian angelic hierarchy and imagery was extensively used to identify the community. The conceptualization of *ASoA* was clearly the work of a single man, but it was conceived as a cultural experiment reliant on community decision-making to shape the project's processes and outcomes. Thus, though not in a "pure" form, *ASoA* can be considered a community-driven project. Table 3 summarizes key areas of interest in *ASoA* by identifying contributory focal points:

Table 3. Contributory Focal Points in ASoA.

A SWARM OF ANGELS	
Project goals	Community-developed, open-source fiction feature with Creative Commons license (by-nc-sa) scheduled for an online release

A SWARM OF ANGELS	
Leadership and power relations	Clearly identifiable leadership, open creative core, meritocracy, rewards chosen by community
Promoters and backers	Community drivenness, gated community, renowned supporters
Degrees of expertise required	No prerequisites, specialized calls
Means of distribution	Internet, Creative Commons license (embedded in project goals), day and date event
Broader social, economic, and cultural connections	Free culture, open-source movement, remix culture, independent filmmaking, entrepreneurship

Source: Author.

Energia Productions/Iron Sky (Finland)

Energia Productions is the company name adopted in 2006 by the Finnish team behind the popular fan film *Star Wreck: In the Pirkinning* (2005), considered the first feature film freely distributed on the Internet. The team's collective interest in its work sparked the collaborative strategy behind its first commercial film project, *Iron Sky*, a science-fiction comedy based on an original screenplay and coproduced by different production companies from Finland, Germany, and Australia. An initial level of participation grew via the Iron Sky website, which featured calls for viral promotion, screening demands, and collective financing, as well as merchandise, premium content, remixing contests, and so on. Furthermore, community participation moved quickly from the *Star Wreck* forums to a new social moviemaking platform, Wreckamovie.com, developed for *Iron Sky* but open to any project. Thus, Wreckamovie users are invited to contribute to tasks in any projects available in the platform, or start their own. Significantly, the main reason behind that move was to avoid possible legal issues with community contributions, as the platform's end-user agreement clearly states. After almost seven years of development, *Iron Sky*'s worldwide theatrical release took place in 2012, and a crowdfunded sequel is in the works. Tables 4 and 5 summarize contributory factors for both *Star Wreck: In the Pirkinning* and *Iron Sky*:

Table 4. Contributory Focal Points for the Star Wreck Project.

STAR WRECK: IN THE PIRKINNING	
Project goals	Fiction feature developed by closed amateur team with strong support of a community
Leadership and power relations	Clearly identifiable leadership and creative core
Promoters and backers	Independently developed in-house, self-financed by core team
Degrees of expertise required	No prerequisites; calls for promotion and subtitling
Means of distribution	Free streaming and download [4]; due to increased demand, two different DVD editions with additional content and some TV screenings

[4]Download currently available only through http://archive.org/details/StarWreckInThePirkining

STAR WRECK: IN THE PIRKINNING	
Broader social, economic, and cultural connections	Fandom, science fiction, Creative Commons, popular cinema, spoof cinema, DIY film saga

Source: Author.

Table 5. Contributory Focal Points for Iron Sky Project.

IRON SKY	
Project goals	Commercial fiction feature developed by professional team with strong support of a community through collaborative platform
Leadership and power relations	Clearly identifiable leadership and creative core
Promoters and backers	Private investors, crowdfunding
Degrees of expertise required	No prerequisites, calls for specific suggestions and tasks
Means of distribution	Traditional window system (theater, DVD/BR, television), added value items (game, collectors' edition)
Broader social, economic, and cultural connections	Fandom, science fiction, independent cinema, popular cinema

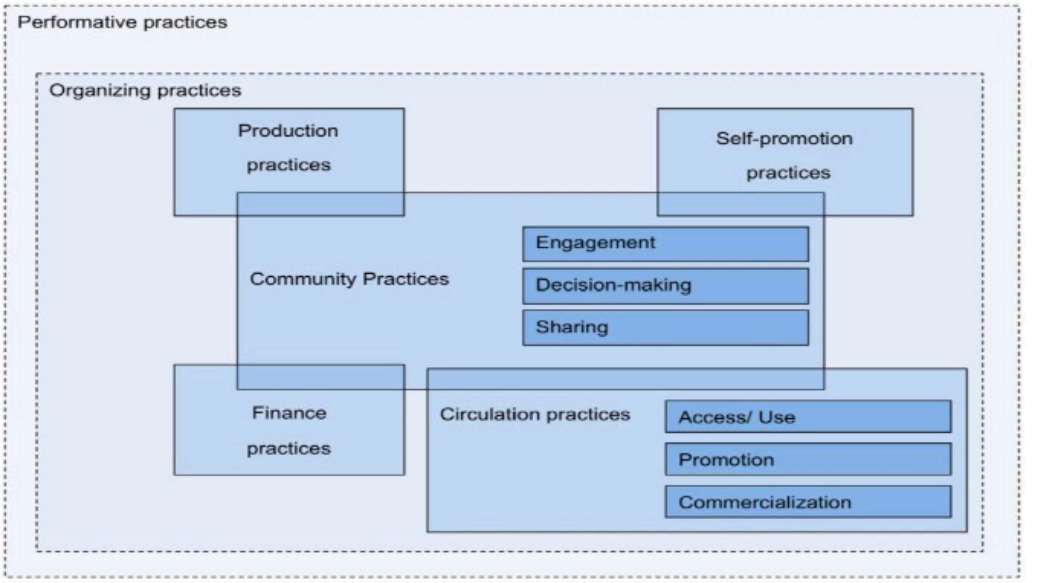
Case Analysis



The two cases have an identical starting point: a creative core launched a film project in which fostering a community played an essential part. However, there are some significant differences, one of them quite defining: *A Swarm of Angels* was born as a participatory experiment where a growing community was expected to shape all the aspects of the project, although under close supervision.[5] On the other hand, the team at Energia Productions harnessed the commitment of an active community of interest that had formed around their previous amateur creative efforts, the *Star Wreck* parody saga and particularly its 2005 installment, the Internet cult phenomenon *Star Wreck: In the Pirkinning*, in order to engage its members in the team's forthcoming, more ambitious project. *Iron Sky* involved plenty of playful offers for participants—even if they had very little real impact on the final outcome, which was tightly defined by its creative core of professionalized producers.

Figure 1 offers a visual introduction to the set of dispersed and integrative practices observed through analysis, which I will refer to below: A practice analysis of both cases revealed a set of integrative practices, that is, specialized domains aimed at the instrumental development of the creative project. These practices were easily identified according to the understandings and procedures necessary to carry them out: production organization, design, screenwriting, promotional content, technology, distribution, music, and so on. However, the different degrees of connection to a creative community strengthened affectivity issues related to motivations, goals, or community engagement. The more the community was in control of a practice, the more transformative options took place, owing to changes in dispersed

[5] Hanson himself referred to *A Swarm of Angels* as a "gated community."

practices coming from community interrelations. Hence, even though similar integrative practices were observed in both cases, ASoA featured identifiable spaces for negotiation and, in some cases, innovation.

Figure 1: Sets of Practices in Participatory Filmmaking Projects.

Source: Author.

(b) *Financing practices* involving the financial support for the project and present from the very beginning in debates and community resolutions.

Some examples revolve around subscription models (the option *ASoA* adopted), merchandising, crowdfunding strategies (broadly defined as collective micro-financing, extensively used for *Iron Sky*), sponsorship, deals with broadcasting companies, and the like. Some of the practices were closely connected to constitutive rules and tended to be frequent objects of controversy, as they wound up tension between the commercial and alternative/experimental sides of the projects. In *ASoA*, the commitment to a subscription model signaled an initial attempt to protect the project from external investment (public or private), which would have been considered a compromise or sell-out at odds with the open-source nature of the endeavor (instead, open-source and free culture acted as constitutive rules). In *Iron Sky*, however, this compromise was much vaguer, opening a wider range of financial options that made *Iron Sky* a hybrid, presented as an independent commercial feature with an alternative creative process. In this case, two main funding strategies stood out: the "Ward Bonds" initiative (2008), a merchandising campaign carefully crafted around the World War II propaganda aesthetics of the movie; and a crowdfunding campaign across different platforms, the self-defining "Race for 300,000 €," which ultimately did not come close to its ambitious goal.

(c) *Circulation practices* concerned with decisions and actions regarding access, licensing, distribution, promotion, or commercialization of content.

Circulation practices are indeed closely related to financing (as in the case of pre-sells to broadcasters or DVD/BR licensing) and both types of practice connect equally closely to the constitutive rules that account for the legitimacy of the project as a form of community/alternative-media organization. However, here they are assigned to a separate category because of particularities in terms of copyright, distribution strategies, and participants' engagement in diffusion. Again, the two cases differed substantially: *ASoA* was open source in nature, whereas the creative core behind *Iron Sky* adopted a strategy of revealing a lot from the production process as a part of the commitment to keep circulation practices as open as possible, combining traditional theatrical release with on-demand screenings run through the *Iron Sky* website.

(d) *Self-promotion practices*, a particularly important set of practices around the promotion of the organizational form itself, as distinct from promotion of the film proper.

These practices exist because of the need to engage participants over time. By emphasizing the qualities and values of the organization or "brand," such as its "authenticity," "innovation," "relevance," and "radical departure" from traditional production, the practices legitimize its activity and pave the way for continuity, not ruling out professionalization. Crucially, the process is, in the end, as much or even more important than the actual feature film. In both cases, but particularly in *Star Wreck*/*Iron Sky*, self-promotion practices acquired an important performative and playful dimension.

(e) *Community practices* focused in different ways on the participants as a collective. Tightly bound to all other kinds of practice, community practices fall into several subcategories identified through the analysis:

- *Informal engagement* to keep the community active and engaged, upholding the mutual compromise essential to any community. Key to transparency, these practices tend to be encouraged by the creative core. Some typical examples are disclosure of information on the progress and milestones of the project.
- *Collective agency and decision making* to foster contribution to decision-making processes and thus proximity to production practices. Again, project promoters are essential to keeping it rolling and are, as previous sections mentioned, key for creative recognition.
- *Knowledge and expertise exchange* focused on social capital inside the community. A direct consequence of the emergence of affinity spaces, these practices are usually created and maintained by members without need of the core team's active participation. They concern different interests in adjacent fields like technology, filmmaking, music, and so on, which brings participants closer to learning communities, communities of practice, and communities of interest.

Besides this set of integrative practices, the research identified two transverse practices that would account as dispersed practices. They can easily go unnoticed, particularly as a project becomes more mature, but they shape and influence the rest of the practices from the very beginning:

(f) Organizing practices, self-reflexive or "meta-" practices oriented to general organization and the establishment of explicit rules, hierarchies, meritocracy, and discussion of expected

rewards, which become an intense source of normativity. It was possible to delve into these organizing practices because the cases were observed from their earlier stages. In consolidated communities, these practices may seem invisible and "naturalized" because they are constituted at the very beginning and only contested at moments of conflict and change. These practices reveal what the participatory condition of a media project really is, and whether the organization is oriented to maximalist or minimalist forms of participation (Carpentier, 2011, p. 215). Debates over every relevant aspect were an intrinsic feature of the ASoA project. Thus the community thoroughly discussed all processes, from the open-source nature of ASoA to rewards for participation, promotional activities, technology, financing, or voting. Another example of negotiation and innovation in the ASoA community was the experiment of developing two independent screenplays at once, the first managed by the creative core and the second one more community-managed. Contrary to initial expectations, the community-based, open-ended screenplay forum ended up much more active and fruitful (Roig, 2008).

(g) *Performative practices*. Most participatory projects include a framework for performative expression and possess a playful dimension that opens the practices to practitioners who need not have the specific technical skills required in professionalized environments. Participants are invited to play at being filmmakers, and also to play with the aura of filmmaking and its processes and imaginaries. The dynamics of these playful practices represent playing with the rules as much as playing by the rules, thus clearing the way to the transformative and innovative. As stated previously, in the case of ASoA, project leader Matt Hanson played extensively with the metaphor of the angelic hierarchy in organizing an open participatory process, and the most relevant call for participation asked the Angels to record videos about their engagement in the project, with minimum technical requirements. For its part, Iron Sky took advantage of its parodic condition as a movie made in Finland about Nazis coming from the Moon to invade Earth in 2018. Fruitfully exploiting the imaginary of World War II propaganda, the project issued hilarious calls to action, attracting participants to remix teasers, demand to see Iron Sky in different countries, fund the movie, or buy merchandising. In the Wreckamovie platform, collaboration is structured in tasks open to anyone regardless of filmmaking skill (many of them, actually not much more than playful brainstorming exercises).

I now return to Figure 1 and connect it to Table 2. This linking of the case analyses of practices with the theoretical approach to participatory projects reveals the importance of transverse dispersed practices—in these cases, organizing and performative practices—in shaping the necessary, ideal, and related conditions for participation. Because these sets of practices embody constitutive rules and act as anchoring practices, it is essential, in order to get an insight of the phenomenon to analyze the early stages of a project and, additionally, critical moments of conflict and change in its course (Roig, San Cornelio, Ardèvol, & Sánchez-Navarro, in press). An important, final point is that actual expressions of integrative practices like production, diffusion, or financing, which are anchored in transverse practices, are tangible evidence of a global practice-based approach to media production; meanwhile, community practices say much about ideal conditions of participation and collaboration.

Conclusions

If anything is really "new" in the changing notion of new media, it is the newly emerging media practices. These practices point to a cultural environment that blurs the traditional divide between producers and consumers. Within it, appropriation, re-elaboration, and play abound; cultural experiences are increasingly socialized; participation and co-creation discourses are embedded even in mainstream productions; and engagement is a fundamental element of any creative endeavor. However, that is not to say that these practices necessarily lead to a new participatory production environment. As shown throughout this article, thorough analysis of practices reveals numerous contradictions: in many participatory experiences, participants have no real decision-making power and are treated as privileged target audiences; meanwhile, many allegedly open projects operate under tight creative control. Yet these operations also offer abundant potential for transformation, challenging traditional assumptions about what people are doing with and to media. As stated above, practices account for innovation and reproduction: New forms of performing a practice can conflict with established ones, fostering a negotiation process with the potential to change the meaning of the practice. Moreover, implicit rules in the background help define what a practice means for the practitioners. These constitutive rules typically only come to the fore in early stages of the practice and at moments of conflict and change.

Throughout, this article has tried to interrogate the idea of the participatory as a sort of empty container expression equivalent to notions like "engagement," "contribution," "experience," or "personalization," which admittedly can assume significant roles under certain conditions. Spaces for negotiation and debate, decision making, transparency processes, and mutual recognition become essential to the consideration of a creative project as participatory. In this sense, practice theory allows researchers greater specificity in investigating the kinds of things individuals are doing in relation to media production, and in relation to each other as practitioners. It does so by accounting for three main components: basic understandings of what the practice is about, procedures (i.e., rules and instructions) that regulate it, and especially the affective elements linked to the practice. Asking what media practices people are involved in allows the focus to move from reception issues—or even mere use, as would be the case for traditional media objects and processes—onto participants, production, and performance.

At the same time, participatory projects expand the reach of practice theory beyond the comfort zone of the everyday. Creative challenges—in which participants, motivated by their own interest in becoming part of a groundbreaking event, put their skills to the test in a long-term process—thus also merit attention. As has been suggested through this article, the act of contributing to an appealing process can be much more important than its final outcome, as it provides opportunities for pleasure, performance, and social peer interaction around a cultural endeavor seen as innovative, socially relevant, and unique. Participatory media projects based on social causes or in fiction owe their strength to the suggestive power of the cinematic imaginary.

CHAPTER 26

Indie Cinema and the Short Film Assemblage

Thomas Barker

Bijdragen tot de taal-, land-en volkenkunde/Journal of the Humanities and Social Sciences of Southeast Asia 177, no. 2–3 (2021): 208–20.

Abstract

Dewi pulang (Dewi goes home), the 2016 short film by Candra Aditya, offers a means to redefine the meaning of independence for contemporary Indonesian screen production. In the years of Reformasi following the end of the New Order, to be independent was to be in solidarity with the reform movement, and to express a diy sensibility that did not rely on big production companies or the state. In recent years, the meaning of independence has been complicated by a changing cultural economy of film, including the accommodation of many previously independent filmmakers into the mainstream. Rather than seeing independence embodied in the film or filmmaker, this essay considers the history of short film and the foundational role of *komunitas* (communities) as the location for independent media practice. Independence is theorized as a characteristic of the assemblage of organizations, events, and infrastructures that facilitate the production, circulation, and consumption of short film.

Keywords

short film, assemblage, Indonesia, *Dewi pulang,* independent cinema

Looking over developments in the Indonesian screen industries since Reformasi, it is hard to identify who or what is independent these days, given that many previously 'independent' filmmakers now work with large production companies and no longer see the state as a target of opprobrium. During the Reformasi years (1998–2005), it was easier to identify independent filmmakers and their films due to their deliberate self-identification,

CC BY

their political stance, and their adopted modes of production (Sasono 2020). Independence was used to assert autonomy of the creator free from dictates of state and big business, while creating work true to the creator's intent and vision. Now, however, independence is normalized, turned into a marketing label or a 'genre' akin to art cinema, often accompanied by an orientation towards international film festivals. Arguably, the meaning of independence has become more blurred and complicated (Ortner 2012).

To reassess the meaning of independence in Indonesian screen production, this essay takes as its entry point Candra Aditya's 2016 short film *Dewi pulang* (Dewi goes home). At first glance *Dewi pulang* exemplifies the blurred meaning of independence in Indonesian screen production: while sponsored by the government's Pusat Pengembangan Perfilman (Film Development Centre) and not especially politically radical, it is a rich cultural text and bears many hallmarks of typical indie cinema that deals with quotidian subject matter.[1] The filmmaker Candra Aditya, who wrote and directed *Dewi pulang*, continues to work 'freelance', sporadically writing stories and scripts, drawing on a pool of similarly freelance talent to make films as and when he can. Taking government sponsorship is not unusual for someone in his position, but it did not mean acquiescence to government demands: he fought to retain scenes of Dewi smoking, despite objections from the government sponsor. Although seemingly minor, it speaks to the ways in which short filmmakers assert their independence by pushing boundaries and challenging norms.[2]

Taking *Dewi pulang* as an example of an independent film requires looking beyond the text and the formalities of its funding, to consider also the 'life' of the film as it is conceived, made, distributed, exhibited, and consumed. Following Harvey (2007:263), we see that the short film 'appears to engage in four topographic spheres of activity: modes of production, object, text, and trace'. She highlights the ways in which the life of a short film does not end with the production of the film (object) but extends to the way the film comes to be (production) and the traces it leaves as it circulates as a cultural object and its reception as text. Harvey's expanded definition of the short film decentres the film-object and highlights the assemblage of networks, agents, and organizations that animate an individual title. By following Harvey, this essay reveals a longer history of short film in Indonesia, which developed an alternative mode of production, distribution, exhibition, and appreciation since the 1970s that subsequently shaped the indie film movement associated with Reformasi and that has continued to provide a model of independence for filmmakers. Central to this short film assemblage are the Indonesian groupings called *komunitas*, which operate as the nodes in the rhizomatic networks of short film (Engchuan 2020).[3] By taking this contextual approach, *Dewi pulang* becomes a means to consider the ways in which independence can productively be theorized in the Indonesian context with implications for the study and understanding of independence for screen production around the world.

[2] *Prenjak / In the year of monkey* (Wregas Bhanuteja, 2016) for example, despite containing an uncensored explicit scene, was screened to government officials including the president and went on to win both the national Citra Award for Best Short film and the Leica Cine Discovery Prize for Short Film at Cannes Film Festival in 2016.

[3] See also Engchuan's contribution to this issue.

Independence is usually defined 'negatively'—that is, independent of something (Lent 2012)—and taken to mean the commercial, mainstream screen industries with their big companies, hierarchical decision-making, capital-intensive production, and mass-market appeal (Ortner 2012). Although derived from a North American experience in the 1990s by filmmakers operating outside the large Hollywood studios, the term was readily adopted by new film movements in Southeast Asia in the late 1990s and early 2000s in line with the political reform movements provoked by the Asian financial crisis of 1997–1998 and the development of digital technologies that democratized access to the means of production (Khoo 2007; Lent 2012). This became the main understanding and context of independence across the region.

In these definitions of independence, the feature-length fiction film is privileged as the exemplary mode, as it is easy to identify its 'other': big production companies and their producers, mainstream content, and stars, with marketing aimed for release in multiplex cinema chains. Other forms of content, such as short film and documentaries, are left outside the discussion. Partly this is explained by an imagined hierarchy that privileges the feature film over these other formats. Even for practitioners, the short film is often regarded as a 'training space' or showreel 'for aspiring filmmakers, [and] a momentary stopping point on the path to feature-length fulfilment' (Holohan 2009). As a result, discussions of the short film usually focus on formal properties, most notably length, and how this gives the form its distinctive characteristics. Gatot Prakosa (2008:27), for example, says that the short film 'has a language far different to fiction feature films, due to its shorter play time'.[4] Although some short-form productions, such as the music video, the advertisement, video art, and increasingly the short-form social media video, have their own cultural (and economic) significance, the feature film remains the sine qua non of the screen industries.

The focus on form by scholars such as Prakosa and Holohan decontextualizes short film out of what Singapore scholar Sophie Harvey (2007:263) calls 'moving image culture'. Harvey draws on Juan Foo's essay 'Mini Cinema: A nation's cinema starts with shorts' (2002), which 'calls for a re(frame)ing of Singapore's moving image culture that recognizes the relevance and importance of short film production' (Harvey 2007:264). The point is not to rewrite film history in a way that simply places the short film as an imagined origin; rather, as Adrian Pasaribu (2013) argues in the Indonesian case, it is to challenge the predominant '*bioskop-sentris*' (cinema-centric) model of cinema that privileges and foregrounds the feature film. By *bioskop-sentris*, Pasaribu means that the prevailing understanding of 'film' is of a feature-length work, comprised of a progression of notable titles and concerned with box-office figures as the measurement of success and cultural significance. In this model, the film industry is centralized around large production companies, television stations, and major exhibitors which operate rigid, large-scale, capital-intensive businesses mostly centralized in Jakarta.

By contrast, Pasaribu says that the short film belongs to a different kind of '*budaya sinema*' (cinematic culture) that is community-based, bottom up, youth-driven, regional, and geographically dispersed. Moreover, short films move in and through the rhizomatic networks of spaces and organizations of this *budaya sinema* in ways that attest to its 'nomadic' and 'polymorphous' qualities (Harvey 2007). Together these characteristics constitute a set of

[4] 'memiliki Bahasa yang jauh berbeda dengan film cerita panjang, mengingat masa putarnya yang singkat'.

principles and organizational features that not only mark it as distinct from the feature film industry but also substantiate its independence. Shorts are less premised on the need to make money to cover investment costs and therefore provide the space for experimentation, voice, and autonomy unavailable in large media productions. Interactions and relationships may continue with the commercial media industries, but an alternative economy of short film organized around its independent principles persists.

Short Film Assemblage

What is significant about *Dewi pulang*, and other shorts like it, is not its length or whether Candra Aditya wants to make a feature film (he does) but, rather, how it reveals the infrastructure of communities, events, and platforms across the archipelago that support and sustain short film. Candra Aditya had worked in these networks for several years before conceptualizing *Dewi pulang* and securing funding. Once completed, the film then moved through a network of festivals, including Purbalingga in 2017, and communities such as Boemboe Forum, which organized Gemar Film Pendek #3 (at Kineforum, Jakarta in January 2018) and Sinema Rabu in South Jakarta (March 2018), before being hosted on Viddsee, a Singapore-based video streaming platform. Together these can be conceived of as nodes within the assemblage of short film.

Central to the short film assemblage in Indonesia is the locally emergent formation called the *komunitas* (community). *Komunitas* are social formations of likeminded individuals who come together for discussion and collaboration; to build events and create publications and other resources; and to nurture new talent and voices. *Komunitas* are often deeply local but develop relations with others across the country in rhizomatic networks. *Komunitas* are amorphous and malleable, appearing and disappearing, at times territorializing into events, festivals, and annual gatherings. *Komunitas* form an alternative economy of film production, distribution, and appreciation that maintains its identity as 'independent' by operating outside of commercial networks and industrialized forms of cultural production.

Prominent *komunitas* organizers Lulu Ratna (2007) and Tintin Wulia (2019 [2005]) note the plethora of *komunitas* which emerged in the late 1990s in the tumult and opportunity of the Asian financial crisis and the end of the New Order regime. Such networks supported feature filmmakers in the early years of Reformasi who readily adopted the indie or independent label to describe their intent, politics, and practice contra the state and commercial production companies. As feature films have returned to mainstream pop culture (Barker 2019), many Reformasi-generation indie filmmakers have been incorporated into the production processes of the largescale production houses. They maintain whatever creative autonomy they can. But the meaning of independent has become more complicated and contested.

Indeed, the origins of the independent-film movement in Indonesia are not to be found in the moment of Reformasi but rather in the work of short film activists who engineered short film as a nomadic movement in the 1970s (Prakosa 2005; Pasaribu 2013). Gatot Prakosa, one of the movement's notable figures and a short film historian, describes the short film scene of the 1970s and 1980s as '*sinema ngamen*' (busking cinema) because of the way filmmakers went from place to place, looking for places to screen and audiences to engage (Prakosa 2008:6). At one of the first events, Festival Film Mini (Mini-Film Festival), held in

1973 in Jakarta, several filmmakers formed Sinema 8, a group dedicated to 8 mm filmmaking to challenge established cinema conventions (Jayasrana 2015). Many of these works were experimental and underground and included work from Gotot Prakosa, Hadi Poernomo, and Henri Darmawan. They congregated at the city-government-operated Dewan Kesenian Jakarta (dkj), which was located at the Taman Ismail Marzuki (tim), and used it as a centre for gathering and exhibition (Prakosa 2008:4).

Their work also contrasted with official short films produced by the Ministry of Information and other state agencies to promote the developmentalist agenda called 'Gelora Pembangunan' (Spirit of Development) of the New Order regime (Jayasrana 2015). Official films were screened to villages using a mobile apparatus that was operated by ministry officials, usually before a feature film presentation. Other 'shorts' were screened on tvri, the country's only television station, also operated by the Ministry of Information. Festival Film Indonesia (ffi) began to acknowledge the short film in its categories of awards, though its focus remained on propaganda and official film. But otherwise, film activists were able to evade state control since the regime focused on feature films and the mainstream distribution channels of broadcast television and cinemas. It allowed filmmakers to experiment in form and content, since they were less worried about mainstream appeal, state censorship, or large budgets.

The art school Institut Kesenian Jakarta (ikj) became an important site for the creation, appreciation, and discussion of short film in the 1980s and especially into the 1990s. Required to make two 16 mm films to graduate (Prakosa 2008:7), film students not only completed a practical task but created opportunities for experimentation and dialogue. Noted critic of the regime and iconic filmmaker Garin Nugroho emerged from ikj in this period, graduating with his short film *Gerbong 1, 2, 3* (Wagon 1, 2, 3, 1984), followed by important documentary work including *Air dan Romi* (Water and Romi, 1991), before moving into feature film in the 1990s with his debut *Cinta dalam sepotong roti* (Love in a slice of bread, 1991). In this period, 'short filmmaking was still limited to the "exclusive" circle of film students in the Jakarta Art Institute (ikj)' located in the national capital (Ratna 2007:304).

Others graduating from IKJ in the early 1990s shared a similar trajectory, but as Prakosa (2008:7) notes, they were beginning to interact much more with overseas festivals. For her graduating project, Nan Achnas made *Hanya satu hari* (Only one day, 1988), which went on to win the Grand Prize at The Young Cinema Film Festival in Tokyo. Riri Riza completed *Sonata kampung bata* (Sonata of the brick village, 1991), which screened at Oberhausen Film Festival, before he worked as the production designer on Nugroho's *Bulan tertusuk ilalang* (*... And the moon dances*, 1995). Together with ikj classmate Mira Lesmana and music video director Rizal Mantovani they conceptualized, shot, and released the omnibus film *Kuldesak* (Cul-de-sac, 1998), which began a revival of feature film production (Barker 2019). Starting in shorts became a noted path for other directors, including Harry Suharyadi,[5] Hanung

[5] Graduated IKJ with *Happy ending* (1996), which screened at Busan International Film Festival. His debut feature, *Pachinko and everybody's happy* (2000), was made in Japan.

Bramantyo,[6] Ifa Isfansyah,[7] Yosep Anggi Noen,[8] and Edwin.[9] While their identities and practices shifted towards the feature film, this did not mean that they became totally disconnected from short film, however, as many continued to move back and forth or contribute to shorts communities through mentorship, for example.

By the late 1990s, however, outside ikj, new forms of 'informal networking' were beginning to emerge with the disintegration of the New Order and its systems of control. *Komunitas* formed in the new civil society spaces and drew on the energy of reform to facilitate the production, promotion, and discussion of short film (Ratna 2007:304). One of the earliest short-film-focused *komunitas* was Konfiden (*Komunitas* Film Independen), which organized the Indonesian Independent Film-Video Festival (ffvii) from 1999 to 2002. At the first ffvii, Konfiden published a manifesto in which 'independence' was defined for the first time in Indonesia, drawing on a 1998 article in Filmmaker magazine by Jim Moran and Holly Willis. It details how independence is operationalized in the sectors of technology, industry, aesthetics, economy, and politics (see Figure 1). Although adopted from the American film

Figure 1. Independence as defined in the Konfiden programme book in 1999.

Translation: Independents as a strong opposition movement against the dominant media practices in some sectors. In technology, independents operate in the world of the amateur (home video, 16 mm, 8 mm) against the professionals (35 mm, 70 mm). In industry, independents operate individually or in free groups that oppose production, distribution, and exhibition organized on a mass scale. In aesthetics, independents support originality, performance, and avant-garde in opposition to the conventional, the generic, and the residual. In economics, independents operate for a love of cinema rather than a love of money. In politics, independents operate in and explore the culture of the marginalized and the oppressed against the centre, the dominant, and the mainstream.

[6] Made *Topeng kekasih* (Lovers' mask, 2001) about inter-generational trauma of the 1960s' purge of leftists that founded the New Order regime. Bramantyo went on to direct early independent features including Brownies (2004), *Catatan akhir sekolah* (Final year notes, 2005), and the mainstream hit Get married (2007).

[7] Made shorts, including Be quiet exam is in progress! (2006) and *Half teaspoon / Setengah sendok teh* (2008) before his first feature *Garuda di dadaku* (The eagle in my chest, 2009).

[8] Made several shorts, including *Ketemu bapak* (Met father, 2002) and *A lady caddy who never saw a hole in one* (2013), before his features *Solo solitude / Istirahatlah kata-kata* (2016) and *The science of fictions / Hiruk-pikuk si Al-Kisah* (2019).

[9] Made *A very slow breakfast* (2002), an experimental mediation on time and desire while at IKJ. He continued making shorts, including *Kara, anak sebatang pohon / Kara, the daughter of a tree* (2005), which screened at Cannes Film Festival. Edwin moved into feature production with *Babi buta yang ingin terbang / Blind pig who wants to fly* (2008), *Kebun binatang / Postcards from the zoo* (2012), and the recent mainstream films, high-school drama *Posesif* (Possessive, 2017) and book-adaptation *Aruna & lidahnya* (Aruna & her palate, 2018).

lexicon, Indonesians did not have an equivalent to 'Hollywood' (Murti 2009 [2007]), so to be independent meant being in solidarity with the reform movement, expressing a diy sensibility, and distancing oneself from commercial production companies and the state. Here the meaning of independence is localized and vernacularized, as it was in many places around the world, including Southeast Asia (Lent 2012).

Short films and their *komunitas* continued to proliferate as others around the archipelago began to take up media production to create community, tell stories, and express ideas. Of these, Minikino, established in Denpasar in 2002, and Jakarta-based Boemboe Forum, established in 2003, were two of the most prominent, organizing screenings, workshops, talks, exhibitions, and networkeing opportunities with others domestically and internationally. Shorts featured at the independently operated Jakarta International Film Festival (jiffest), first held in 1999, and in dedicated festivals such as Purbalingga, which was established in 2006.[10] The official Festival Film Indonesia (ffi) was relaunched in 2004 with a short film category, won that year by *Djedjak darah: Surat teruntuk Adinda* (Blood print: A letter to the beloved), directed by M. Aprisiyanto from Yogyakarta, marking an aesthetic break with the ffi winners under the New Order.

These networks have expanded beyond Indonesia with the creation of regional networks and communities, fostering the exchange of ideas, talent, and capital. International film festivals in Busan, Singapore, and Europe have nurtured many Indonesian filmmakers through shorts programmes and by hosting workshops and training. Viddsee, a Singapore-based film-sharing platform, began in 2013 to share and promote Southeast Asian shorts alongside other video sites, such as YouTube. SeaShorts Festival, established in Malaysia in 2017, promotes shorts production and regional networking. Both bring into dialogue filmmakers and others in the region and are part of the expanding transnational assemblage of short film.

Traces of the short film continue to shape commercial media production from online content such as web series to omnibus feature-length projects. Social media company line, for example, sponsored an Adaapadengan Cinta? (What's up with Love?) teaser in 2014 that was watched by over seven million people and lead to the feature *Ada apa dengan Cinta 2*? (Riri Riza, 2016). Celebrated features director Joko Anwar has used the shorts form as paid promotion and, in one case, as a teaser to secure feature funding.[11] Others have followed the *Kuldesak* example and made omnibus features, including *Berbagi suami* (Love for share, Nia Dinata, 2006), *Parts of the heart* (Paul Agusta, 2012), and *Belkibolang* (Agung Sentausa, Ifa Isfansyah, Tumpal Christian Tampubolon, Rico Marpaung, Anggun Priambodo, Azhar Lubis, Rico Surya Pratama, Edwin, and Sidi Saleh, 2010). As with the new format of the 'microfilm' in China (Gilardi et al. 2020), we see how the short form is also integral to the new media industries of Indonesia.

Conclusion

Dewi pulang offers a means to understand the economy of short film that operates in parallel with, but not necessarily in opposition to, commercial short formats (such as advertising) on the one hand, and the mainstream feature film industry on the other. From this emerges a newly theorized meaning of independence that is premised on the kinds of infrastructures, organizations, and modes of production that emerge from this dispersed, nomadic, and polymorphous moving-image culture. Indonesia offers a unique vantage point with its *komunitas* that have energized and sustained this economy of shorts. *Dewi pulang* stands as an emblematic film that speaks to the larger film culture in Indonesia, to the skills of the filmmaker, and to the new definition of independent film culture.

CHAPTER 27

Independent Canadian Music in the Streaming Age: The Sound from Above (Critical Political Economy) and Below (Ethnography of Musician)

Andrew deWaard, Brian Fauteux, and Brianne Selman

Popular Music and Society 45, no. 3 (2022): 251–78. https://doi.org/10.1080/03007766.2021.2010028.

Abstract

This article illustrates the precarious position of Canadian independent musicians in the streaming era. In the first section, we articulate the sound of the Canadian music industry from above, providing a macro-level political economy, looking at multinational conglomerates, streaming technology, financialization, consolidation, and inequality. In sections two and three, we listen to the sound from below using ethnographic methods, relaying the experiences of independent musicians within an increasingly precarious industry. Based on feedback from the musicians we interviewed, we conclude by providing a series of recommendations and ideas to foster a more equitable, community-based music culture.

Keywords

Independent music, music in Canada, music industries, music scenes, political economy of music, streaming music

Introduction

"I thought it was this viable career choice. That with enough effort, you could make it work," laments Lee Klippenstein of Slates and Screaming Targets when reflecting on a decade-plus career as a musician. "I certainly don't think that's the case now." Many independent musicians, in Canada and elsewhere, find themselves in a similar position, increasingly unable to support themselves making and performing music. Unless something "emerges to challenge the status quo" that has made a working career as a musician so unsustainable, John K Samson of the Weakerthans and Propagandhi expects only "further consolidation and a narrowing of who can live as a musician."

This article illustrates the precarious position of independent musicians in the streaming era.[1] Though its focus is Canada, it joins a number of articles (Mühlbach and Arora; Nickell; Towse) that position a nation's music industries and its independent musicians within the globalized streaming music era. What this article adds to the conversation is a dual methodological approach, using a combination of critical political economy and ethnography. In the first section, we articulate the sound of the Canadian music industries from above, providing a macro-level political economy, with attention paid to multinational conglomerates, streaming technology, financialization, platforms, consolidation, and inequality. We are influenced by Hesmondhalgh's call for "more systematic historical comparisons . . . beyond an excessive focus on new players . . . to the cultural-industry and political-economic contexts in which those organisations are embedded" ("Is Music" 19). With a broad, statistical overview, we aim

[1] "Independent" is a fluid and imperfect category but we use it throughout this article due to its currency as a term describing creative autonomy, a low-to-middle income status, and/or music making that operates at some distance from the major record industry. However, there are many downsides to the term independent, such as its relation to taste and distinction, its occasional meaning as formal experimentation, its lack of precision (see Dryhurst for a discussion of why the term "interdependent" captures the ambiguity of much music-making), and its history of being privileged by scholars in contrast to mainstream music released on major labels (see Mall). Furthermore, the term independent has become increasingly imperfect as many independent artists and labels maintain limited partnerships with major labels and the variety of income streams that artists engage with today complicates the independent-major binary. Our use of the term is also based on our interviews, in which musicians discussed their conflicted independence: not charting on major hit charts but may have (or had) moderate radio airplay (likely on public, campus, or satellite radio); relying on government grants for support; maintaining a tenuous relationship with labels and intermediaries; and who are laborers not only in making music but in other adjacent areas like promotion, social media management, tour booking, and so forth. We considered a number of alternative terms (non-superstar musicians, low-to-middle income musicians, working musicians, community-based musicians, and musicians struggling to achieve a living wage), but found all of them imprecise as well. See Hesmondhalgh ("Indie") and Bennett and Strange for further discussion of the term independent. Similarly, "music industry" is a slippery term and we aim to be specific about the many music industries (including recording, publishing, radio, live, licensing, and streaming), while still maintaining a broad perspective on what constitutes musician labor within a consolidating industry/set of industries. Furthermore, many musi- cians themselves, including our interview subjects, often imagine themselves in some sort of relationship with "the music industry." See Hesmondhalgh ("Flexibility"), Toynbee, Frith, Williamson and Cloonan, and Sterne for further discussion.

to map systemic inequalities and demonstrate the existential hardships faced by independent musicians in Canada.

In sections two and three, we listen to the sound from below using ethnographic methods, relaying the experiences of independent musicians within an increasingly precarious industry. Our study uses interviews with seventeen artists from Edmonton, Alberta, and Winnipeg, Manitoba. We are influenced by Cohen's call for "an ethnographic approach to the study of popular music, used alongside other methods [that] would emphasise that popular music is something created, used and interpreted by different individuals and groups . . . a human activity involving social relationships, identities and collective practices" (127). Cohen warns against "a reliance upon theoretical models abstracted from empirical data, and upon statistical, textual and journalistic sources," which need "to be balanced by a more ethnographic approach" (123). By incorporating theory, data, and journalistic sources, along with interviews of independent Canadian musicians, we aim to provide an account of the dire situation of our musical culture that is being accelerated by corporate consolidation, financialization, and platformization. Based on feedback from the musicians we interviewed, we conclude by providing a series of recommendations and ideas to foster a more equitable, community-based music culture.

The Political Economy of Canadian Music

When it comes to studying national music industries on the periphery of the American-led global music industries, an attention to global macroeconomic concerns is key. Many of the world's national and regional music industries are increasingly affected by a tight oligopoly of transnational (mostly American) music, technology, and financial companies. Media consolidation is not a new concern, but its intensification through financialization, streaming technology, and platformization is tightening the grip of power held by the biggest companies. The political economy of music is heavily shaped by only two or three massive conglomerates in each subsector, shaping the opportunities for musicians of all stripes. In recording and publishing, the "Big Three" of Universal Music Group, Sony Music Group, and Warner Music Group dominate the industry. Reports range from the Big Three controlling at least 70% of the global recording and publishing market in 2019 (Stasen), to as high as 86% of the North American market in 2016 (Christman). The exploitation at the heart of record label contracts is well documented (Stahl, *Unfree*; Arditi). In the live concert and ticketing business—often a musician's leading revenue source—LiveNation (which owns Ticketmaster) and Anschutz Entertainment Group (AEG) form a duopoly, controlling the rights to perform at the largest venues and festivals, while dictating onerous terms to musicians. American terrestrial radio stations have been consolidated into homogenous, centralized networks by iHeartMedia, Entercom, and Cumulus, reinforcing the power of American superstars in global markets. The satellite radio market, once a promise of expanded diversity and opportunity, is now dominated by the merged entity SiriusXM. Internet radio was another format with potential for range and innovation; its biggest success, Pandora, was recently acquired by Liberty Media, a conglomerate that also owns SiriusXM, has investment stakes in LiveNation and iHeartMedia, and whose Chairman, John Malone, openly stated that "the goal would be to get to full consolidation" (qtd. in Szalai and Vlessing). Into these highly consolidated music

industries, streaming music arrived on a promise of expanded access and opportunity; the reality has been quite different.

Streaming in the Music Industries

The shift to digital music has reconfigured the music industries in myriad ways. Scholars often chart these changes by conceptualizing a new relationship to music: moving from consumer electronics to "networked mobile personalization" (Hesmondhalgh and Meier), based on the "digital music commodity" (Morris), mediated through overlapping networks and "technological assemblages" (Leyshon), which craft a "branded musical experience" (Morris and Powers) for "users" that are provided a service rather than consumers who are sold a product (Anderson). An adjacent historical paradigm is provided by Towse, who outlines the way digital service providers (DSPs), or platforms (such as Spotify, Apple, and Amazon), have altered the established method by which songwriters and recording artists are paid. Rather than discrete sales, a DSP uses platform pricing for subscriptions and ad-based services, which has depressed the royalty rates paid to musicians, now "too low to fully sustain a full-time career as a recording artist for the majority" (Towse 14).

As the largest growth market in the music industries in recent years, streaming platforms have been subject to a growing body of scholarship. Marshall provides an early analysis of the ongoing controversy over artist royalties, focusing on Spotify's meager payouts to musicians and its "pro-rata" revenue sharing model, in which pay to musicians is allocated according to total number of streams across the platform, rather than a user's subscription payment being divvied up among the musicians they listened to individually. Spotify's payment model favors big labels with many clients and extensive catalogs, while disadvantaging independent musicians and labels without the comparative scale. Hesmondhalgh further discusses the potential advantages of a user-centric model, rather than pro-rata, while also challenging simplistic criticisms of streaming music services, such as the reliance on dubious "per-stream" rates and the lack of systemic analysis ("Is Music"). Vonderau adds to this holistic understanding of streaming, arguing that Spotify is not just a music service, but operates at the intersection of advertising, technology, music, and finance. The importance of debt financing and brokerage to Spotify's rise, as Vonderau delineates, is essential to understanding the political economy of music; lurking in the shadows behind this technological transition to streaming music is the power of speculation.

Financializing and Platformizing the Music Industries

Financialization—the accelerated growth and power of the financial sector and its extractive logic—has had a dramatic but oft-unacknowledged impact on the consolidation of the global music industries in the last two decades. Private equity firms are a case in point; these investment funds buy companies using debt that is raised against the assets of the target company itself, referred to as "leverage." The investment fund then *pays itself* to restructure and financially engineer the company to "maximize efficiency," then seeks to sell the streamlined property at a profit. Warner Music Group, for example, was acquired by Bain Capital, Thomas H. Lee Partners, and Providence Equity Partners in 2004, which resulted in mass layoffs, including staff and musicians, as well as the reduced operational capacity of many of the historic labels

within Warner Music Group. In 2007, Terra Firma used debt-financing to acquire venerable British music company EMI and proceeded to lay off the existing management and nearly half of its workforce. Unable to restore revenues, Terra Firma forfeited control of EMI to its creditors; EMI's publishing arm ended up in Sony Music Group, while its recording arm was sold to Universal Music Group. The result of this instance of predatory financial extraction was a reduction from the "Big Four" record labels to the "Big Three."

Radio has been another target for financialization. In 2008, Bain and THL acquired Clear Channel, the largest US operator of radio stations. The layoffs were immediate, with many rounds of layoffs in the subsequent years. Smaller stations were sold off, the focus was shifted to only the most profitable stations, and local programming was replaced with syndicated programming. Saddled with $20 billion of debt by its private equity owners, the renamed iHeartMedia filed for bankruptcy in 2018 in order to restructure its debt. The second largest radio operator in the country, Cumulus, experienced a similar decade of private equity, consolidation, debt, streamlining, and homogenization. The private equity experiences of Warner Music Group, EMI, iHeartMedia, and Cumulus—four of the largest conglomerates in the music industries—demonstrate that the story of private equity is not just the rapid looting of profit in its successes, but also the debt-saddled wreckages it leaves in its failures.

In addition to private equity, other financial firms are circling the music industries. Institutional investors, such as Blackrock and Vanguard, have assembled dominant investment stakes in all major media companies, using this "common ownership" to reduce operational capacity, limit competition, and raise prices (deWaard). Investment groups, such as Hipgnosis Songs Fund, Round Hill Music, Concord, Shamrock, Primary Wave, and Lyric Capital Group, are acquiring recording and publishing rights in an effort to turn catalogs of songs into speculative assets. Hipgnosis, for example, owns an investment stake in more than 57,000 songs (over a thousand of which are #1 songs), is valued at over 2 billion dollars, and recently received a billion dollar investment from private equity company Blackstone to continue its mission of "establish[ing] songs as an uncorrelated asset class with attractive risk adjustment returns" (Ingham). Canadian musicians such as the Weeknd, Justin Bieber, Carly Rae Jepsen, and Neil Young have had their publishing rights financialized in this manner. In conjunction with this external financial pressure, the Big Three labels have enacted internal strategies of financialization, such as monopolistically leveraging their back-catalogs in order to gain equity stakes in streaming music companies, such as Spotify, Rdio, and Soundcloud. Finding great success in this investment-based strategy that requires no sharing of royalties with its artists, the Big Three labels now operate their own venture capital funds, as do all major media companies.

As the financial sector consolidates and extracts capital from established media sectors and copyright licenses, Big Tech companies create the platforms that are reshaping the working practices of today's creative workers. This "platformization of cultural production" has sharpened "expectations of digital visibility in cultural work" and led to a distribution of revenue that is "notoriously uneven and subject to very strong 'winner-take-all' effects," with massive uncertainty surrounding the ability for small-and-medium businesses or artists to "generate sustained long-term revenue" (Nieborg 25, 30–31). There is a long history of exploitation and precariousness in the cultural and creative industries, of course, one that predates the financialized and platformized streaming media era (Hesmondhalgh, "User-generated"; Hes-

mondhalgh and Baker). Workers in all creative sectors have been faced with an increasing reliance on entrepreneurialism and tasks adjacent to the making of art, music, and cultural products, while cultural policy has been limited in its capacity to respond to unsustainable working conditions (McRobbie). The music industries have numerous examples of uneven power dynamics between the record industry and recording artists (Stahl, "Primitive"). And though more musicians can release music today, evading previous gatekeepers to digitally distribute their own work to streaming services for a fee, not requiring a record label, their ability to actually make a living wage doing so are severely curtailed. There is a distinct lack of transparency when it comes to how musicians are being remunerated, making historical comparisons difficult (Hesmondhalgh, "Is Music"), but it is becoming clear that the result of this financialization, consolidation, and platformization in the music industries has been escalating inequality: a boon for corporations and superstar musicians, but devastating for average musicians.

A recent Citigroup report found that the U.S. music industry generated $43 billion USD in 2017, but artists received only 12% (Sanchez). Within that meager 12%, there is stunning inequality among artists and it's worsening: the top 1% of artists accounted for 77% of all recorded music income in 2014 (Mulligan). By 2020, the top 1% accounted for 90% of streams and the top 10% of artists accounted for 99.4% (Smith). Another analysis showed the 10 top-selling tracks command 82% more of the market and are played almost twice as much on Top 40 radio than they were a decade ago (Thompson). The top 1% of live performers earned 26% of worldwide concert revenue in 1980, but that market share had climbed to 60% in 2017, taking in more revenue than the bottom 99% combined (Krueger 85). The top 5% of artists also increased their share of the pie, from 62% to 85%, meaning the market share for the remaining 95%—the vast, vast majority of working musicians—has decreased from 38% of the market in 1982 to just 15% in 2017 (85). Meanwhile, the average American musician made only $21,300 from their craft in 2018 and 61% report music income is not sufficient to meet their living expenses (Krueger and Zhen). In Canada, the average musician only makes $17,900/year, less than half of the average Canadian worker's income, and well below the poverty line (Hill, "A Statistical"). It is more winner-take-all in the music industries than ever before and the vast majority of creators are struggling to earn a living.

The Canadian Music Industries in the Streaming Age

The Canadian record industry has ties to the much larger American record industry through a domestic-international or subsidiary-parent company relationship. Canadian subsidiaries have typically developed national artists for a domestic market to determine the potential for international distribution. Beginning in the late 1960s, the existence of Canadian subsidiaries of major multinational labels "mirrors an international pattern; these firms have set up national branches and manufacturing plants in many countries" (Straw 102). As one example, the wider political economy surrounding Capitol Records' first Canadian record pressing plant, which opened in 1976, indicates an industrial logic that was largely American in structure (Fauteux et al.). Many Canadian independent record labels that have released albums by Canadian artists have developed distribution deals with major labels. For instance, the Toronto-based Arts & Crafts Records, home to notable indie acts like Broken Social Scene and Feist, had EMI Music Canada as its distributor until 2013 when EMI was merged into

Universal Music Canada. Furthermore, the label's co-founder Jeffrey Remedios is now the CEO of Universal Music Canada. While there is an increasing focus on digital music and streaming services today, lessening the importance of producing, distributing, and retailing material cultural products like records, Canada is still part of a global context in which large, often American, record or tech companies retain significant influence.

Transnational financialization and consolidation means the livelihoods of Canadian musicians are subject to the structural constraints established by Fortune 500 CEOs, Silicon Valley programmers, and hedge fund managers. The consolidation of the Canadian media sector only exacerbates the situation. The Canadian Media Concentration Research Project notes that vertical integration within the country "is very high by historical standards and almost four times current levels in the United States," as the top five media companies (Bell, Rogers, Telus, Shaw, and Quebecor) accounted for 71.1% of the $80 billion CAD network media economy in 2016 (Winseck). Vertical integration has real impacts; the control of the Canadian radio sector by the ten biggest radio groups grew from 50% in 1997 to 82% by 2018, leading to homogenized playlists and limited exposure for new musicians (Canada, *Minutes*). The 2006 policy for commercial radio noted that the sector was financially sound, in part due to the fact that the 1998 policy increased the limits on the number of stations a licensee could own in a single market (CRTC). Alongside this increased consolidation is the fact that commercial radio and other major music industries in Canada have been "slow to embrace genres outside of Rock and Country" (Sutherland 230). For this reason, many independent artists and musicians who perform music not typically heard on more mainstream channels have sought out Canada's public and campus radio sectors for airplay.

Radio in Canada has historical and ideological connections to ideas about national identity and community (however ambiguous) and these ideas shape the mandate of a national public institution like the Canadian Broadcasting Corporation (CBC). Section 3 (1)(b) of Canada's Broadcasting Act (1991) claims that the broadcasting system provides a "public service essential to the maintenance and enhancement of national identity and cultural sovereignty." The CBC has a mandate to reflect the regional and cultural diversity of Canada; to contribute to shared national consciousness; and, to develop Canadian talent (Canada, "Organization"). Thus, the CBC makes efforts to showcase music from across Canada's regions and it is mandated to program at least fifty percent Canadian content. In addition to the CBC, all Canadian music radio must program a certain percentage of Canadian musical selections across the broadcast week in the form of Canadian content regulations. Commercial stations are to have at least 35 percent Canadian music selections across the broadcast week. Campus stations are also usually licensed at or above 35 percent. Most significantly, campus stations are licensed to reflect their local communities and to complement commercial and public radio programming. This means that music programming often prioritizes local artists and music from a wide variety of styles and genres (Fauteux; MacLennan; Mastrocola). Established in 1971, the aim of these content regulations was to boost the Canadian music industries (see Muia), but they have not been updated or applied to internet consumption, like streaming music services, and are therefore less relevant to the financialized, consolidated, and platformized global music industries.

Responding to this worsening media climate, the Standing Committee on Canadian Heritage studied remuneration models for Canadian artists and creative industries in 2019.

The resulting report (Canada, "Shifting") focused on the industry term "value gap," "a disparity between the value of creative content enjoyed by consumers and the revenues that are received by artists and creative industries" (6), which it linked to "a severe decline in the ability of artists to earn a middle-class income" (7), in large part due to "wealth [having been] diverted from creators into the pockets of massive digital entities" (23). A report generated by Music Canada agreed, arguing that the creative labor of Canadian musicians "subsidize[s] major online platforms and telecommunications conglomerates through Canadian copyright exceptions that prevent performers and record labels from being properly compensated" ("Closing" 10). The total cost it estimates to have been lost to the Canadian music industry since 1997 is over $19 billion ("Closing" 18).

While pointing to the extractive and consolidated nature of tech platforms and telecoms is certainly justified, Music Canada fails to mention the effects of the concentration of the Canadian recording industry, perhaps because it is a trade group funded by the Canadian subsidiaries of the Big 3 record labels: Sony Music Entertainment Canada, Universal Music

Canada, and Warner Music Canada. According to the WINTEL Worldwide Independent Market Report in 2018, Canada has one of the highest rates of major label market share in the world, at 75%, as indicated in Figure 1. Only Spain, Denmark, and the UK had a higher rate. Correspondingly, Canada has one of the lowest rates of independent record label market share at 25%. Even the United States has higher (38%). The global average is 40%, while more equitable countries like Japan (63%) and South Korea (83%) should be the goal. It is no wonder that Music Canada's solution to the "value gap" is punitive copyright legislation; the Big 3 record labels would continue to profit handsomely within their oligopoly.

Within this consolidated Canadian industry, there are many inequalities. Three of the biggest global streaming superstars are Canadian—Drake, the Weeknd, and Justin Bieber—and they have dominated in the streaming era: from 2005 to 2017, they had the top 8 most

streamed songs of Canadian musicians, 31 of the top 50, and 72 of the top 150 (Bliss). Each of the three has continued to rack up global hits and chart records since that time and their success has positive effects for the Canadian music industries, facilitating jobs and international attention. However, their success also casts a long shadow; most recent statistics on Canadian music are artificially inflated by these three megastars, clouding our picture of the health of the industry. Sales and streaming figures that subtracted these three artists would present an even more alarming reality for the average musician. What might appear as a profitable, vibrant industry from baseline numbers is in fact dominated by three musicians, all three of whom are signed to US-based Universal Music Group. Figure 2 depicts a representative sample of chart entries of Canadian musicians on the Top 100 Singles Charts in Canada during two time periods: 1990–1999 and 2009–2018. The 1990s, the height of both the CD

boom and Canadian content regulations, witnessed a wider variety of Canadian musicians making popular music that reached a substantive Canadian audience, at least as measured by charts. There were 306 distinct Canadian musicians who made the top 100, 3,730 total chart entries, 1,154 unique songs, and the top 3 musicians controlled only 5–10% market share of the chart. The streaming era, by contrast, has been notably less diverse for Canadian music: only 246 distinct Canadian musicians (including many cover songs and one-hit wonders from song competition television series), 2,588 total chart entries, 764 unique songs, and a

dramatic trend line down in all categories, except the increasing market share of Drake, Justin Beiber, and the Weeknd, which reached as high as 46% in 2016 and 2017.

Regional inequalities are widening as well. Ontario, particularly the cultural hub of Toronto, has a disproportionate significance within the Canadian music industries, with nearly half of music sector jobs nationwide, over 60% of Canadian music publishing and recording export revenue, and 58% of the Canadian total GDP generated by this music sector as of 2017 ("In-

dustry Profile-Music"). Figures 3 and 4 demonstrate this inordinate power of Ontario within the Canadian recorded music industry, with a limited sector in Quebec, and the remaining provinces and territories struggling to maintain jobs and exports of recordings. Government grants help mitigate this imbalance, as discussed by musicians below. But in the case of grants awarded by the Foundation Assisting Canadian Talent on Recordings (FACTOR) from 2013 to 2020, as seen in Figure 5, more than half of total money went to Ontario musicians, despite the province having less than 40% of the population. Correspondingly, other

provinces and territories receive a disproportionately lower amount of funding compared to their population. To make matters worse, conservative governments at both the federal and provincial level continue to slash funding to arts and culture programs when possible: in Ontario, funding for the Ontario Music Fund was reduced from $15 million to $7 million by the province's Progressive Conservative 2019 budget ("Ontario government"); in Alberta, the United Conservative Party enacted a 5 per cent budget reduction to the Alberta Foundation for the Arts ("Arts and Creative"); and in Manitoba, the Progressive Conservative Party proposed $8 million in cut to community groups, including the Winnipeg Arts Council (Kavanagh).

Issues of diversity and inclusion are another concern when considering worsening inequality within the streaming age of music. Amidst this corporate consolidation, listener data are showing a reduction in the diversity of music across vectors of gender, class, and ethnicity. A report on Spotify's most-streamed artists in 2018 indicates that all of the top artists are men (Byager). A deeper analysis of 600 Billboard Hot 100 songs from 2012 to 2017 found an average of 16.8% female performers, 12.3% female songwriters, and only 2.1% female producers (Smith et al.). A UK study found only 12% of musicians in 2019 were from a working-class background, down from 20% in previous years; women and people of color were further disadvantaged (Carey et al.). In Canada, female artists make 82 cents of total income for every dollar of male artists, with Indigenous artists making only 68 cents on the dollar (Hill,

"Demographic"). With this overview of the political economy of Canadian music, it is clear that independent musicians face undue hardship in pursuing their career. The next step is turning to the musicians themselves, listening to their perspectives and values, in order to advocate on their behalf.

Amplifying Artist Perspectives in the Streaming Music Era

To get a sense of how artists in Canada have been navigating their careers within the context of the political economy of music in Canada, we interviewed nine musicians in Edmonton, Alberta, and eight in Winnipeg, Manitoba. Some of these artists continue to live and work in Edmonton and Winnipeg while others have moved to larger cities in order to develop their careers. Interviews ranged from thirty to ninety minutes and took place in person between December 2019 and March 2020, although some were conducted via phone or video chat for artists who were located elsewhere. The interviews followed a fixed set of questions, but with exploratory contextual prompts to continue in areas that seemed of particular interest to the project and the interviewee themselves. Possible themes were identified prior to interviews, then iteratively updated as we listened to and reflected on the stories and answers shared by the musicians. The career paths of these artists are unique but what unites them is some distance from the major record industry. These are artists without major label representation and without regular commercial radio airplay. Some expressed an aspiration to eventually find commercial success while others have maintained a do-it-yourself and independent ethos throughout their careers.

These cities were chosen for practical reasons (one member of our research team lives in Edmonton and one in Winnipeg) but also to call attention to cities that are infrequently the focus of writing on music in Canada. Studies of music making in Canada predominantly focus on larger cities with more venues, music-related businesses, and radio stations, such as Toronto, Ontario or Montreal, Quebec. While both Edmonton and Winnipeg are mid-sized cities (the population of the former is 981,280 as of 2017 and the latter is 749,534) with a number of music venues and recording studios, they do not maintain the music infrastructure and support of Canada's larger urban centers. Both cities are also isolated in terms of their proximity to other large cities, although Edmonton is relatively close (about a three-hour drive) to Calgary, Alberta's other major municipality. In Winnipeg in particular, this has led to a certain pride in the local scene, as it is difficult to travel elsewhere for shows. These interviews highlighted three aspects of the artist experience that are relevant to analyzing the political economy of music in Canada: the core and peripheries of "the industry," touring and geography, and grants and funding.

The Core and Peripheries of "The Industry"

Because our interview subjects either live or have lived in the mid-sized cities of Winnipeg and Edmonton, there is often a career trajectory that involves moving to a larger city where more music infrastructure is located. Some interviewees mentioned the ability to find more work opportunities in bigger cities and that there is a better chance of having a gatekeeper, like a SiriusXM programmer, present at a live performance in Toronto. Both Colleen Brown and Cayley Thomas are singers, songwriters, and instrumentalists who moved to Toronto

from Edmonton. Brown commented on the increased prominence of the business side of music in Toronto and explained that "it just felt like almost every time I watched an artist build up in Edmonton, there would be some kind of wall where it just wouldn't build past a certain point." Natanielle Felicitas, a freelance cellist, expressed a similar sentiment in the Winnipeg context but with some frustration about this trajectory: "I know everyone sort of concentrates themselves in Toronto and a lot of Winnipeggers are told to go there if they want to have the next level up. It would be nice to see Winnipeg have . . . more industry, more middlemen." For other artists, however, a city like Winnipeg represents more opportunities for producing and performing music. The late Kelly Fraser, a beloved Inuk pop singer and Juno Award nominee, detailed a music journey through bringing back the "Inuit drum" which was "lost years ago from missionaries telling us to ban it." Fraser added, "I learned how to play in Inuit Studies in Ottawa's Nunavut Sivuniksavut for two years. I was able to bring it back to my community . . . [and] collectively we brought that drum back." She later found that it was hard on her mental health to be back in her community in Nunavut "because I didn't have a lot of support and I wasn't saving money. So I moved away to Winnipeg to try to make it, though it's very hard." Canadian musicians often wrestle with the dilemma to stay in their community or relocate to a larger city with more industry opportunities.

The process of becoming acquainted with different levels or tiers of the music business can be tricky. For many musicians, there is a need to be strategic with respect to deciding when to establish partnerships with labels or other industry intermediaries like a publicist or a booking agent, and how much of their own money to spend. Most interview subjects commented on the fact that they have worked with a manager or a publicist but that these partnerships were temporary and timed to align with a major funding opportunity (such as a grant application) or an album release. This process of negotiating budgets and partnerships to align with key benchmarks of one's career seems to be a strategy that defines the experience of independent musicians in Canada. One indie solo artist from Edmonton mentioned that her publicist was the most expensive line on her marketing budget but that little return had come from this expense. Marti Sarbit, vocalist and songwriter of Imaginary Cities and Lanakai, explained that a manager was essential for putting together large grant applications. This perceived requirement to participate in "the industry" in a specific way can be a significant obstacle for many. Fraser indicated that forms of institutional racism can be a barrier for participating with labels, an issue she connected to a longer history of colonialism in Canada: "I don't know if labels that are mostly run by white people or people who live in the West with Western ideologies and values, I don't think they'd be able to see what I'm trying to do, trying to teach." She did try to work with a label for her album *Sedna* but the label requested that she sing only in her language; she wanted to sing half in English and half in Inuktitut because that is how she teaches. She decided not to work with the label given their efforts to control her practice.

Touring and Canadian Geography

A study on the music ecosystem in Alberta noted that 73% of artist income comes from performances and touring ("West Anthem"). Studies out of the US corroborate this finding; the *Future of Music* found that much artist revenue has to be sustained by aggressive touring ("Artist Revenue Streams") and *The Creative Independent* indicated that most musicians in the

US are not able to earn a living wage through music-related work, with most income coming from performing/touring at 61% (Köerner and Kladzyk). Touring is not an option that is accessible to everyone. The increasing emphasis on live music within a musician's workload raises issues for those in Canada, given a vast geographic area and low population. Musicians living and working in the northern territories have an especially difficult time touring, facing exceptionally long distances and expensive travel options. Although streaming services help reach audiences beyond borders, it forces musicians to rely on live shows and touring to generate an income, as opposed to selling albums (Weaver). Some artists noted the increasing importance of festivals and showcases, in which one can spend a few days in one area and perform and network with the hopes of building a team to help advance their career. Some felt that it is difficult if not pointless to tour across Canada, finding it to be more effective to fly to a different region and visit a number of towns or cities in that particular area.

In most cases, artists emphasized the necessity of touring, although the financial return of this endeavor varied across responses. Klippenstein said that for his Edmonton-based bands, it is usually "a 50/50 split between show sales and records and merch sales. . . almost always strictly vinyl for us." He added that live shows and merch sales have "been, really, the only thing to sustain us." Fraser noted that an increase in popularity had meant having to tour and more regularly. Before, she avoided planning tours but instead, "specifically allowed [herself] to be available to Indigenous people who want me to play at their events on their reserves in Nunavut" and did "a lot of workshops and motivational speaking." Winnipeg-based Samson said that most of his income comes from live revenue but when he plays with a full band he makes "what the band makes and it's not very much."

The logistics of organizing tours and live performances is often a fundamental aspect of a Canadian musician's career and thus a number of musicians discussed working with booking agents. This has had both positive and negative outcomes. Klippenstein said that an agent has resulted in slightly higher guarantees than if he had booked shows himself but that the end result is often ending up on bills with mismatched bands and "poorly attended shows." One's relationship and experience with venues is another aspect of the booking process that many noted as significant, particularly when planning and organizing shows themselves. Transparency and communication from the venue is crucial. As Big Dave McLean, a celebrated Winnipeg blues guitarist, songwriter, and Member of the Order of Canada, said, "If I'm going to Sault Ste. Marie, well it's going to take me a while to get there and I sure hope there's a gig for me when I get there. In the past I have shown up to, 'Oh gee, I'm sorry I forgot that I booked this guy too.'" Sarbit added that some venues "will send you this beautiful contract ahead of time and give you all the information you need. Love those venues."

One of the most striking takeaways from the artist perspective on touring in Canada is that geographic and financial obstacles can determine the logistics, and thus often the sound, of the performance. Thomas indicated that her recordings are quite layered, and she has thought, "Oh, why did I have to include a vibraphone!? . . . How to pair that down because that's a big thing. I guess, to create a product that you can recreate with as little resources as necessary." Similarly, Felicitas said that "It's cheaper for just one person to fly there and tour Eastern Canada with the Eastern string players as opposed to bringing me along." Further, genre plays a role in determining one's ability to tour and perform in smaller cities or towns. Josh Sahunta, an Edmonton-based R&B and pop singer-songwriter, explained that because

he fits within the "genre of easy listening" he can get a wide variety of bookings because his music "is not really something that would be off-putting in any setting." Based on the fact that some artists expressed that it can be difficult to reproduce the sound of the record in a live context given the additional costs it necessitates, it can be said that the sound of the music one hears in a live music context is shaped by financial and logistic realities and these obstacles are more prominent for new and independent artists. Certain genres and styles of music that lend themselves to solo artists or smaller outfits seem to travel more efficiently.

Government Grants and Funding

One opportunity for artists in Canada is a robust funding framework for musical activities including recording, promotion, and touring. Shapiro explains that Canada "has one of the most extensive systems of any country for funding of the arts and is viewed as a model case by other nations" (90). The Liberal government's Budget 2021 included $70 million over three years to Canadian Heritage for the Canada Music Fund (CMF), including $50 million in 2021–22 to help the live music sector with difficulties faced during the COVID-19 pandemic. The CMF funds major Canadian granting organizations FACTOR (for the English market) and Musicaction (for the French market). Sahunta has taken advantage of this system and describes grants as "invaluable" and has used them for tours, showcases, and recording. By no means is this a perfect funding framework, but a number of musicians emphasized the reliability of grants as a significant source of financial backing. One Juno Award winning folk singer-songwriter from Alberta said that "the most funding that I get is from grants. I would say that about 50% of them are Indigenous-based grants. And that's the money that goes towards my travel and towards creating new albums."

Grants range from those provided by local organizations such as municipalities, radio stations, and banks, to organizations at the provincial and federal levels. Typically, the more local the grant, the easier it is to acquire, at least in mid-sized cities like Edmonton and Winnipeg. Klippenstein said that three of the most expensive albums recorded over his career "were funded by a radio station that had no radio shows that played any sort of music similar to [his bands]." This was called the "10k20 program," which involved twenty bands receiving $10,000 and was a "fairly straight forward grant to write." The larger grants offered by FACTOR are said to be more difficult to acquire and they often require assistance (such as a manager) as well as money to be put forth by the artist themselves. FACTOR was founded in 1982 by three of Canada's largest broadcast chains in partnership with the Canadian Independent Record Production Association and the Canadian Music Publishers Association. Over the years, it has expanded its funding opportunities but has worked to manage a balance between "providing opportunities to those artists and companies in need of support, but also to those with potential to reach some level of commercial success" (Sutherland 223, 226). About half of our interview subjects had applied to FACTOR for funding while others preferred smaller, low-stakes, regional or local grants. FACTOR's smaller grants, like the Emerging Artists Program, introduced in 2007–08, still require a certain level of industry experience, such as demonstrating a certain threshold of sales and radio airplay (Sutherland 227). Across our interviews, the importance of grants was routinely emphasized, and artists have used a variety of funding sources to help sustain their careers and livelihoods.

Some grants do come with significant barriers, particularly the larger ones that support a range of activities across an extended period of time. Thomas described the FACTOR Juried Sound Recording (JSR) grant as "the Cadillac . . . of the FACTOR programs." She said, "while a very generous grant, it requires you to put a bit of your own money in." Klippenstein expressed some frustration with the need to account for statistics and keep accurate records for the purpose of putting larger grant applications together. With a delightfully Canadian example, he noted that it can be hard to keep track of record sales on the road: "I don't know how many records we sold, because the book fell in a snowbank or whatever." Fraser described the grant writing process against dire circumstances under which her bandmates were low on money and starving. Some of her bandmates "went days without eating." A grant was approved by the territory (Nunavut) and she said, "one of the things that they told me was, 'next time you write your proposal, make sure you're grammatically correct.' And, it's like, right now, that's not my biggest priority."

In a larger arts-funding context, there has been a noted turn to instrumentalized benchmarks for acquiring and justifying grants. Another example of a major industry grant in Canada is the Radio Starmaker Fund, one developed by private broadcasting trade association the Canadian Association of Broadcasters. As Shapiro notes, this fund reflects a move to support "stars" as opposed to Canadian culture or content and the fact that "new talent would have to sell between 2500 and 10,000 units in Canada to qualify" meant that a significant number of artists were ineligible (94). Beyond Canada, Behr has described how a focus on a "free-market economy" has shaped state funding of the arts in a number of national contexts, where money spent on "the arts came to be spoken of in relation to the returns it generated: profits, tax revenues and jobs" (279). A common sentiment expressed by interviewees was that grants tend to privilege "the people who are more strategic and less artistically driven" (as said by one anonymous interviewee). Others bemoaned the fact that Facebook "likes" and YouTube "views" become part of the criteria for a successful application. Greg MacPherson, Winnipeg singer-songwriter and co-owner of indie record label Disintegration Records, raised questions about what sort of music might get funded if we circumvented ideas about instrumental return. He said, "I would love to see all that support going into . . . some weird electronic music from The Pas [a small town just over 600 km northwest of Winnipeg] or something that's very different and unique."

There is a relationship, then, between a sort of homogenization of music finding success through grants and within the higher echelon of the music and record business in Canada. Samson said, "I do feel like the homogenization of the industry is basically leading to artists, musicians, being mostly people like me . . . middle-class people with support, people who've kind of won various lotteries." These points echo Sutherland's claim that FACTOR has had "well-developed procedures for responding to ongoing changes in its target sector" but this has not been matched in its effort to address matters of diversity through the 2000s (despite this being an emerging government priority not specific to the music industry) (229). Many other participants questioned whether a polished grant proposal is strongly correlated with interesting music.

Community-led Values and Opportunities

Throughout our interviews with musicians there was a pronounced focus on the value of community between artists and local institutions. Music scenes offer a means by which to consider music's relationship to the local, a relationship that informs "notions of collective identity and community" (Bennett 3) and they are shaped by institutional spaces that bring people together through listening to music and participating in the production and circulation of music (Fauteux 130). Scenes can be shaped by genre conventions and expectations as well. In O'Connor's writing on punk, "scene" means "the active creation of infrastructure to support punk bands and other forms of creative activity" (226). For cities like Edmonton and Winnipeg, a sense of community can bind individuals and institutions within a music scene, where campus stations, record stores, venues, and so forth, support and sustain music-making. However, as interviewees from these cities pointed out, there can be limitations for career-minded artists who wish to move beyond the local scene and establish themselves beyond its borders.

Music communities and scenes are interwoven in the ways that each are understood as integral to music in geographic and social spaces. The idea of community is fluid and can be fraught. It is easy to romanticize "community" against the notion of a major music industry monolith. It might be a vehicle of exclusion by which certain artists or industry intermediaries are welcome to participate at the expense of others (exclusionary practices that might be oriented around taste, class, race, gender, and so forth). Alternatively, an idea of community might conjure ideas of participatory and collaborative music making or cultural production (Mayes 19). Despite myriad meanings, it is necessary to emphasize the fact that community is a term that helps musicians make sense of their everyday lived realities and experiences as artists and, throughout our interviews, a number of key characteristics can be said to define or describe community-led values in the context of music-making. Within a larger framework of music scene studies and community-based music-making practices, our interviews with independent musicians in Canada point to three themes for which we might focus attention and energy in our thinking about how we might restructure or reimagine the music industries in the streaming media era. These include: Sustainability for musicians (livelihood), sustainable infrastructure, and transparency and community.

Sustainability for Musicians

A "sustainable music career," of course, is defined differently by individual musicians. For some, the ability to play music and to tour without losing money is the goal. For others, the aim is to make a living wage off of playing and recording music. As one artist claimed, the desire to "put art in the world that I think is meaningful" often means having to make money to survive and to sustain one's self. Another defined a sustainable career as "paying rent, paying my bills, having a decent standard of living . . . being able to afford to take care of my child."

There are a number of obstacles to achieving a sustainable career. Many interviewees stressed the toll that music-making and the increased pressure to carry out a wide variety of tasks and jobs related to their career can have on their mental health, a hazardous situation explored by Gross and Musgrave. Sarbit explained, "All I wanted to do is make music. I didn't necessarily want to run a business at the same time and take care of the people in it." There is

a tension between spending time writing music and the need to be on social media "talking about it," as Felicitas said, echoing a dynamic that Baym isolates. Sahunta indicated that a larger "obsessiveness" with social media "is pretty toxic to mental health" and can involve a "constant comparison cycle." Fraser emphasized the mental health struggles that come with being an artist, "because you don't run on a paycheck . . . if you can work nine to five but still get no money. You can go do a show and still not make money." Commenting on the common narrative of the need to tour to earn income in today's music industries, Samson said that heavy touring ruined a lot of personal relationships.

The standards and structures set by the music business can be difficult to conform to and they often work against one's artistic sensibility. Arlo Maverick, an Edmonton-based hip hop MC, commented on the increased pressure to release singles more regularly but that he sees himself as an album artist: "I want to take time to create a body of work." He added that there have been rapid, significant changes in the nature of an artist's creative practice and labor over the last decade or so: "all of a sudden it's like, 'Okay, if you want to be on our site, you need to pay us money'" (see; Burton). At the same time that artists are coming to rely on corporate social media platforms for marketing themselves, the companies behind these platforms are increasing the barriers between fans and artists. Jared Salte of alternative-pop band the Royal Foundry said that both Facebook and Instagram have changed their algorithm and that there is now a financial cost required for fans to see the news or updates that the band is sharing.

The entrepreneurial nature of a musician's creative labor reflects the variety of income streams that any one artist might require in order to maintain, or work toward, a sustainable career. Royalties from radio, money from sync and licensing deals, adjacent income (such as working a second job), and streaming music royalties are some of the most frequently cited income streams according to interviewees. Some artists said that airplay on the CBC's radio services provided reliable royalty cheques. A number of artists said that their royalties from being played by the satellite radio service SiriusXM were amongst their highest sources of income. When the American services XM Radio and Sirius Satellite Radio were licensed in Canada (both have since merged to form SiriusXM) a number of Canadian channels were required, including CBC music channels, like Radio 3. Sound Exchange, which deals in royalties from streaming radio like SiriusXM, was said to pay more than most other royalties. Fraser explained that one large check from Sound Exchange and performance rights was notably significant, which helped to "pay bills, build credit, buy a new car . . . pay for my own recordings" and to "even pay [her] sister's bills and help [her] family out more." Brown has been participating in songwriting circles "to build up a library of songs that could potentially work for placements or song licensing." Far from a dying medium, radio is in fact the lifeblood of many independent musicians' careers.

A less reliable source of income has been per-stream payments from streaming music services like Spotify. There is a paradox between the dominance of these services and the pressure artists feel to have their music featured on playlists and the accompanying payouts that artists receive. As Salte says, "Over the past five years, we've seen our streams go up but our [streaming] income go down quite a bit." Others have been slightly more successful, such as Sarbit who, after being featured on a playlist and generating nearly a million plays of one song, received around $4,000 (still a very small number considering the high number of streams). Shane Matthewson from noise rock band KEN mode said that "as far as new fans

discovering us, it's through Spotify playlists" and noted that one of their songs was on a Spotify metal workout playlist "and that's our top streamed track." While income from streaming is predominately negligible, some have found ways to profit off of the opportunities that a playlist feature or listener data affords.

Sustainable Music Infrastructure

Infrastructure, which includes institutions and resources that are essential for music-making (venues, cultural intermediaries, and local media), is a key component of a music scene and the broader environment that enables a musician to remain in a city or town. There is the issue of sustaining venues themselves and ensuring that there are places for artists to perform, but also ensuring that live music venues and festivals are accessible and inclusive spaces. Spencer Heykants from Edmonton rock band Counterfeit Jeans explained, "It's good to see that a lot [of venues] are adopting inclusive space policies. So people who sometimes wouldn't feel comfortable going out to see a show now feel that they're welcomed." Issues of accessibility, inclusivity, and equity shape not only the audiences' experience of a performance but also the artist experience. Samson highlighted the example of inequality with artist payouts. He recalled an instance when he and partner Christine Fellows "both played the Winnipeg Folk Festival two years apart with exactly the same band and she got paid a third of what I got paid."

While venues may be the most obvious place where musicians and audiences come together, a range of spaces and places like studios, radio stations, print weeklies, and record stores combine to support local music-making in important ways. Many interviewees noted that campus radio stations have been helpful as a "pipeline to get your music across the country especially because touring can be prohibitively expensive, given the size of this country" (as said by Jed Gauthier of Counterfeit Jeans). Sahunta traced the success of one of his albums to campus radio: "It started charting on campus radio across Canada, there were a couple of stations in the UK that picked it up. and then I started getting offered some really cool gigs out of that." Campus radio remains an important local media outlet for independent artists, particularly as the trend in commercial media has been to delocalize. A notable benefit of the campus sector is that artists can submit music to stations directly, as opposed to having to pay for an aggregator to distribute music via a streaming service like Spotify. Edmonton is served by the University of Alberta's CJSR-FM and Winnipeg has CKUT-FM at the University of Winnipeg and CJUM-FM at the University of Manitoba, but artists typically submit music to stations across the sector, hoping for national airplay. Local media and journalists are strong advocates for local musicians, but this is a resource that has nearly disappeared from music cities in Canada and beyond. Other components that artists indicated were missing or lacking within the broader framework of sustainable music infrastructure were "more community organizations . . . like a resource centre" to help figure out things like contracts (Sarbit); and "mental health aid for artists is like massively needed" because music is "such a personal endeavor that if things don't go well, it can get dark" (Sarbit). Fraser was frank about her struggles with mental health and trauma, and mentioned the support provided by the Unison Benevolent Fund. Tragically, she died by suicide shortly after talking to us.

Transparency and Community

A lack of transparency across various components of the music industries was a recurrent issue expressed by interviewees. A veil of uncertainty permeates an artist's relationship with people and things that are essential to their careers, including, but not limited to, labels, contracts, grants, and playlists. Klippenstein mentioned that one label was "reluctant to even tell us what the records had sold" and that there was very little sense of what money was coming in from streaming music services. Brown cited the importance of transparency when dealing with contracts but that it is expensive to hire an entertainment lawyer. She noted specifics like ensuring that artists know what Sound Exchange is and how it works and that there are "differences between performance royalties here in Canada versus the performance royalties in the US." Brown added that "for the next album that I'm putting out, I made the decision to hold on to my masters. it's a huge income stream if you do get your songs played on the radio or satellite radio." In another compelling example, Samson has used his platform to inform audience members at live shows about how much he has been paid that night: "I feel like it's important to do because if we want justice and diversity, there needs to be transparency about who's making the money, because it's usually not the artists."

Another recurring theme among our interviews was the privileging of community and care over commercialism. Rather than profit-seeking and entrepreneurialism, a community of care has been central to the livelihoods of artists and to the notion of sustainable music infrastructure. Artists often advocated for a community of care, built upon mentorship, resource sharing, and community networks. Arlo Maverick is an advocate for mentorship and he offers grant writing support to others: "I've sat on juries before, I've written grants before, I've written grants for the artists. And with that information, I don't look at it from the standpoint of, 'Okay, this is mine, I don't want anyone to have it,' I look at it from the standpoint of, 'Okay, who needs to know about this?'" Fraser also emphasized the importance of teaching and educating within a community. "I teach [children and others] how to write a song and people are seeing the value in me trying to build a bridge for other Inuit artists," she said, "because I don't want them to suffer like I did." A notion of community also came through in certain comments about productive relationships with respect to the task of booking shows and tours. One artist explained that after touring for over five years, "I feel at home in so many places and Canada feels like a neighbourhood to me and it's really lovely and I am so cared for by so many different places and it is so loving." Samson has found that outside ideas about community defined only by music itself, he has found comfort in a music community that was also a "political music community" which means feeling as though he is a part of "a real community that's not based on competition."

Conclusion: Recommendations for Canadian Music Industries

"Water running along a pavement will readily seep into every crack," Ed Yong writes about the failure to contain the COVID-19 virus; "so, too, did the unchecked coronavirus seep into every fault line in the modern world." Though the plight of musicians may not rank among the most immediate concerns of the pandemic, the diversity of our musical culture could well be another victim of the virus. COVID-19 led to an overnight collapse in the live

concert market, the livelihood for many performing artists. But as this article has sought to demonstrate, Canada's music industries were already riven with fault lines, through which many of its most promising musicians were falling through the cracks. The task before us is to rebuild in a more sustainable fashion.

In response to this rebuilding effort, our research project—driven by a methodology employing both "top-down" political economy and "bottom-up" ethnography—aims to offer recommendations from both perspectives as well. In a separate article, we document our efforts advocating for musicians in government copyright consultations and the need for antitrust and anti-monopoly action, as well as public streaming infrastructure (Selman et al., forthcoming). In the following, we draw from suggestions our interviewees made, synthesized with our own thoughts on the political economy of Canadian music, to offer three main recommendations, which balance a need for near-term reforms and long-term transformations. We advocate for the implementation of policies, structures, and practices that,

1. prioritize a broad and diverse class of working musicians, not just superstars;
2. use government support to achieve sustainability for both an artist's livelihood as well as for music infrastructure that is not monopolistic; and
3. shift emphasis away from market-oriented, profit-based, commercial conceptions of Canadian music and toward a community-based, care-informed model.

Musicians have different needs and aspirations; becoming too reliant on one aspect of the music industries or on one income source can be detrimental to supporting the careers of varied artists. It is with this point in mind that our recommendations hope to rethink and revitalize the ways that artists are supported in Canada.

Supporting a Diverse, Working Class of Musicians

"If music becomes something that people just do as a hobby," Gauthier laments, referring to the difficulties of a working musician, "you're going to lose a whole bunch of voices in music because you're just going to have the people who can afford to pursue music careers." As non-Canadian multinational companies dominate the industry, government support through grant money is of vital significance, a key point that was raised by all of our interviewees. Thus, we strongly encourage increased funding at the municipal, provincial, and federal levels. The metrics for which artists qualify for grants should be continually restructured so as to allow for a wider diversity of artists to receive support, with less focus on discriminatory markers such as "proper grammar." Struggling artists should be supported by means-tested grants and mental health support should be a priority. Provincial music organizations, like Alberta Music and Manitoba Music, were, for the most part, described as helpful resources that are, as described by Felicitas, "really good at connecting the dots, especially across Canada." Given some of these barriers and the larger instrumental turn in arts funding, some musicians shared ideas about how to reform the granting process. Salte pointed to an Alberta Foundation for the Arts grant that covers living expenses "for while you're working on something" as a "great, forward-thinking" grant because "that's a very real need for an artist." Others indicated that application systems could be more user-friendly and that, in some cases, juries could be more

diverse. The grant-writing process itself could be subsidized, as its current process favors the educated and well-connected. Furthermore, positive working relationships between federal and local organizations can be a productive way to decentralize the music business in Canada and strengthen musical and cultural activities in localities across the country. Bolder yet, this patchwork of government funding initiatives could be replaced with a universal basic income (UBI) for working musicians who can demonstrate some minimal level of productivity and fandom. As Wright envisions, a UBI would create "a massive transfer of resources to the arts, enabling people to opt for a life centered around creative activity rather than market-generated income . . . creat[ing] a potential alliance of poets and peasants" (74). Imagine the vitality and diversity of Canadian music if independent musicians were not saddled with constantly hustling in a winner-takes-all corporate contest.

Cultivating an Equitable Music Infrastructure

Nurturing a healthy music culture requires more than just ensuring musicians are being paid. There are a number of opportunities for rebalancing equity within Canada's complex music infrastructure. Taking inspiration from the campus-community radio sector in Canada, which is nonprofit and regulated so as to program Canadian, local, and varied music, we imagine productive scenarios in which certain live music venues might operate as nonprofit organizations and be committed to the showcasing of diverse and independent music. These venues could be connected to campus-community stations and serve as a reliable venue for radio programmers and station volunteers to organize shows for local and touring bands that reflect the station's music programming. Just as commercial radio stations with more than $1,250,000 in annual revenue make financial contributions to Canadian Content Development (including FACTOR, Musicaction, and the Community Radio Fund of Canada), profitable and high capacity live music venues and sports and entertainment complexes could help to finance smaller, nonprofit music venues (particularly if a large entertainment complex receives public funding to be built, such as the Rogers Place arena in Edmonton). With more funding, campus-community stations could expand their partnerships with local and student-produced media to cover local and diverse music. Given the dominance of music listening on Spotify and Apple Music in Canada, and the increasing importance of playlist inclusion, we need regulations that mandate a wider variety of Canadian artists on playlists for the major streaming companies operating in Canada. There is a long history of cultural policy in Canada that serves to promote and protect Canadian culture, particularly against American cultural exports (Skinner and Gasher; Armstrong), such as the aforementioned Canadian content regulations, and there is much debate as to how this can play out in digital and streaming media. The Liberal Party's proposed Bill C-10, for instance, seeks to promote Canadian content in digital and streaming media but it has been met with opposition and concerns about user rights and net neutrality (McKelvey). Nevertheless, algorithmic bias toward certain, mostly corporate content already exists; now is the time to consider how to effectively implement local, regional, and diversity mandates.

Moving beyond a Profit-based Conception of the Music Industries

Considering the onslaught from transnational media conglomerates and financialization, the diversity and vitality of Canadian music will not only require continued government support for arts and culture, but bold action, such as financial reform, cultural protectionism, and antitrust enforcement. Reform that would truly help independent Canadian musicians would strike at the corporate power held all across the cultural industries: record labels, publishing, touring, radio, tech platforms, and financial firms. As a rash of new research indicates, antitrust reform and tax increases are increasingly necessary to tame the power of monopoly in the new gilded age (see Dayen; Teachout). The commercial culture facilitated within this transnational corporate atmosphere is stifling Canadian music and our interviews pointed to this plight. MacPherson said that "we need to try to take a step back from the notion that commercial viability is the best way to achieve our collective goals"; instead, we should focus on ways to "create a culture of creativity, of imagination, of celebration, of our uniqueness and less about competing on the market to get some sort of weird market share that's already flawed and broken." One anonymous artist feared a dystopic future if the current incentives of the streaming-based music economy continue: "it's not sustainable. we're going to end up with no art to stream." As tech platforms become more entrenched in our daily and cultural lives, their designation as a utility becomes more appropriate. A public, nonprofit approach to streaming should be considered, one that privileges community, care, and sustaining working musicians over non-Canadian corporate profit. Capital City Records at the Edmonton Public Library is one example of a digital public space that could be used as a model. The library provides local artists with an honorarium to make their music available for anyone with a library card, with artists retaining rights to their content which can still be shared and sold anywhere else. This example highlights ways that listeners, artists, and cities can be connected through noncommercial, public spaces. Moreover, such a space is able to make use of the internet and digital technology in a way that partially circumvents unfair power dynamics and concentration in the media industries. With more local public libraries joining this initiative, a national network of local, library-based streaming music services presents an exciting alternative.

COVID-19 is an unmitigated disaster for Canada's music culture. The songs that will never be recorded and the live concerts that will never be staged are a dramatic loss for our nation's heritage. But as it has been in many sectors, the pandemic is also an opportunity to rethink what is most essential and how our structures do or do not support those essential workers and values. New space has opened to consider alternatives to ossified, unequal industries. To Yong's metaphor of the pandemic being like water that has seeped into every crack of the modern world, we can add Leonard Cohen's: "There is a crack, a crack in everything/That's how the light gets in.

Acknowledgments

This article results from the Social Sciences and Humanities Research Council of Canada funded Cultural Capital Project. Thanks also to William Northlich, Anna Dundas-Richter, Maria Khaner, and Daniel Colussi, who provided research assistance and insights into the project.

Thanks to all of the artists who generously gave their time to be interviewed but especially Kelly Fraser, beloved Inuk singer, who was gracious and giving, and will be sadly missed.

CHAPTER 28

Crowdfunding for Independent Print Media: E-Commerce, Marketing, and Business Development

Peter Konhäusner, Marius Thielmann, Veronica Câmpian, and Dan-Cristian Dabija

Sustainability 13, no. 19 (2021): 11100. https://doi.org/10.3390/su131911100.

Abstract

Crowdfunding, as an alternative method to fundraising, triggers increased awareness in society, while it is also an effective marketing tool for campaign runners. The production and release of independent print media poses significant hurdles in terms of financing. Including the community in raising funds through crowdfunding seems like a good possible alternative. This paper examines which types of crowdfunding the independent print media use, and why, and also focuses on the possible types of crowdfunding that are the best fit for organizations. The study applies a case example approach on a total of thirty independent print publications that have relied on crowdfunding. We found that independent print media focus on reward-based crowdfunding for the launch of publications, the method being not used solely for fundraising, but also specifically for community building. Practitioners benefit from the insights by being enabled to draft campaigns that are better-suited to the specific needs of the independent media target group, and to secure financing for the start of the operations. The approach of this study is of special value, as the research and empirical insights into the independent media sector are limited.

Introduction

Analogue, as well as digital, media act as infomediaries between the producers and the recipients of information [1,2]. In the last decades, a shift from analogue to digital media usage can be observed [3-6] With the emergence of social media at the advent of the Web 2.0, the roles of the producer and the consumer became fluent [7-9]. One of the consequences, triggered by filter bubbles, is the rise of fake news leading to social tensions [10,11]. Therefore, media companies have a social responsibility when distributing information, and influencing local, regional, and international communities [12-14].

Hence, the independence of the media, especially political independence, is important in order to preserve the unbiased coverage of events in all fields of life [15,16]. Being, and staying, independent is especially grounded in the stable financing of operations, without pressure from lower financial resources [17,18]]. Therefore, the different forms of fundraising for media deserve special attention and have been the object of ongoing scientific research over the last years [19-24]. In particular, operating publications independently from established publishing houses is a challenge because of the lack of visibility, marketing options, and resources [25,26].

Crowdfunding has gained traction, visibility, and acceptance as an alternative means of financing for startups, as well as for small- and medium-sized companies [27-29]. Apart from the gathering of monetary funds, marketing effects can also be observed [30-32]. Therefore, crowdfunding is becoming a popular alternative to traditional financing options, such as bank loans or investors [33-35]. Running a crowdfunding campaign better preserves the independence of the company or the project than applying other alternatives [16,36,37]. The campaign runner is accountable to many supporters, who each make a small contribution, in contrast to the single bank or investor that provides a larger sum of money [38].

Although the research on fundraising for media [39,40], as well as crowdfunding research [35,41], is ongoing and quite extensive, there has been little research about their intersection, or about how crowdfunding can be used for financing media [42]. Especially lacking is research into the ways that the independent media are using crowdfunding to finance their operations and stay autonomous in the long run. As a first object of research, independent print media representing the classical media and that is produced on a project basis seems of interest [43,44]. Moreover, the increasing costs of paper and printing, the decreasing willingness of advertisers to place ads in print publications, as well as the lack of financial support received by bigger media organizations that the independent publisher does not receive, makes independent print media using CF platforms to finance their projects a reasonable scope for research [45,46]. Therefore, we investigate which types of crowdfunding are used by the independent print media, and which crowdfunding types best suit their purposes. Furthermore, the various benefits gained from crowdfunding for independent print media are also analyzed. Answering the research question will provide more information on pos-

sible fundraising strategies for the independent print media, that has gained in importance, especially in the cultural field, over the last couple of years [47-50].

Our paper extends previous knowledge based on communication theory and focuses on new technologies (e.g., platforms) that are very popular as communication tools. We also draw on the network society theory. According to Castells [51,52], a network society is one in which social structures consist of networks based on communication technologies, and that has an infrastructure of social and media networks that shape its organizational forms at all levels: individual, group, and societal [53]. Crowdfunding has become a proper instrument [54], and a new internet-based method for raising the financial resources needed for relevant projects [55].

The theoretical part of this paper discusses the crowdfunding field, but also the independent print media, and the various financing options for media. In the empirical section, thirty case examples of independent media running crowdfunding campaigns have been observed and analyzed, and the common characteristics and patterns in using this fundraising method were identified. By relying on a case example approach, this study serves as an example of how this empirical method can be used to observe niche phenomena inductively and qualitatively. From a practical perspective, the research findings benefit all stakeholders involved in crowdfunding, as outlined in the conclusion.

The paper is structured as follows: Section 2 of the paper approaches the theoretical background of crowdfunding, the independent print media, as well as fundraising for media. Thereafter, Section 3 provides an overview of the methodology used, while Section 4 highlights the research findings and discussions in relation to recent scientific contributions. Finally, the conclusion in Section 5 answers the research question and gives theoretical and managerial implications. Furthermore, limitations and further research questions of the study are discussed.

2. Theoretical Background

2.1 Crowdfunding

If many people are contributing to projects, different constellations are possible. People can work independently as freelancers, as part of a project team under supervision, or as members of different organizations [56,57]. An organization outsourcing the key processes of the internal value chain to an external crowd is pursuing a crowdsourcing approach [32,58-60]. The external supporters can act free of charge or be paid by the organization [61]. The reasons for crowdsourcing vary but can include the fact that it is more cost-efficient and flexible, and that engaging external stakeholders can help with finding out-of-the-box solutions [62]. Crowdsourcing can be applied to a variety of different scenarios, from idea generation and problem-solving, to joint pattern analysis and distributed logistics [63,64]. Crowdsourcing has been a rising trend in different industries over the last decade [65].

Crowdsourcing can also be applied to meet the financial needs of an organization [32,60]. This specific usage is called "crowdfunding", and it is being used by organizations, as well as individuals, to fund projects, companies, hobbies, and charity causes [58,66,67]. Observed from another perspective, crowdfunding is already applied by banks when they distribute

the savings from the depositors to the borrowers needing money, claiming an interest for the service [68]. The rise of crowdfunding in the age of digitization is driven by platforms that act as infomediaries and directly connect the supporter and the campaign runner [29,69-71].

The term, "crowdfunding", is inspired by concepts, such as crowdsourcing [59], but represents a distinct category of fundraising and is facilitated by an increasing number of websites dedicated to this endeavor [72]. Crowdfunding usually involves three stakeholders: the project initiators who are looking for funding for their project; the backers who are willing to support a specific project; and the crowdfunding platforms that act as intermediaries [69,73]. Project initiators and backers are often private persons but can also be NGOs or startups [69]. Backers, in their role as platform users, can be influenced by social networks [74-76], and their motivation for involvement can also vary [77]. It is also important to underline that their behavior can be influenced by the decisions of other backers [78]. Unlike traditional financial intermediaries, crowdfunding platforms do not lend and pool money on their own behalf. They focus on bringing together project initiators and backers and funders by providing information about the projects [73].

Crowdfunding platforms differ in several dimensions. Therefore, it is not surprising that there are various types of crowdfunding. A classification relevant for the present study is that of Haas et al. [79]. They draw a distinction between three major types of crowdfunding: hedonism, altruism and for-profit. Hedonism describes a type of crowdfunding where backers contribute money for innovative and creative projects and products. These platforms usually set minimum amounts and pledges and aim to create "a hedonistic value" ([73], p. 14) that is achieved through the support of such projects. Crowdfunding platforms of this type are Kickstarter or Indiegogo. In terms of charitable projects, the predominant form of support for the altruism-type of crowdfunding is donations. Backers support projects of this type for purely altruistic reasons. Typical platforms are Crowdrise and Kiva. A crowdfunding type with a profit-oriented promise focuses on financing startups, but also on granting consumer credits. In return, the backers are offered monetary benefits [77]. Representative platforms are FundedByMe or Prosper [73].

Four different categories of crowdfunding can be identified: lending-based, donation-based, reward-based, and equity-based [80-84]. While lending-based crowdfunding aims at the crowd providing monetary funds in exchange for interest (much like a bank), donation-based crowdfunding works like one-to-one offline donations. The donator gives money and expects nothing in return [71,85,86]. As lending-based crowdfunding is quite like banks remitting loans, banks have identified this category of crowdfunding as a way of acquiring new customers [69,87-89]. Reward-based crowdfunding is often used as a preselling/pre-ordering method for inventions and new products [90]. For providing funding for a project, supporters receive material or immaterial benefits in return (e.g., the finished product, a meeting with the management, etc.) [91-93]. The goal of equity-based crowdfunding is the long-term relationship between the supporter and the campaign runner [94-100]. Therefore, equity-based crowdfunding is also seen as a combination of holding shares in a stock-listed company and being an entrepreneur: The supporter has direct contact with the management and participates in the future profits of the company [100-102]. Ideally, the supporter becomes an ambassador for the vision of the company or project [103,104]. Crowdfunding has, besides the monetary benefits, a strong marketing effect for the campaign running party

[31,32]. In all the crowdfunding categories, the supporters risk the loss of the investment if the campaign runner's project or business fails after a successfully conducted crowdfunding campaign [105-108].

Among those who can choose the type of crowdfunding best-fitted to the need, besides the supporters and the campaign runners, additional stakeholders must be considered within the ecosystem [92,109]. External agencies support the success of the campaign with know-how and human resources [110-112]. Banks and external investors have an interest in knowing about the campaign, as well as the possible consequences, and more exposure means more parties being involved in critical decisions [97,98,113]. Media, suppliers, and customers should be informed about the campaign and can, by chance, be converted as supporters [114,115]. Employees, besides contributing to the campaign, can serve as important multiplicators of the campaign [116]. Every crowdfunding category offers different values for the involved stakeholders. With that in mind, it seems logical that each different industry, and even each different company, might choose a different crowdfunding approach [30,31,117].

2.2 Independent Media

Politically independent media outlets are seen as an integral part of a healthy society as they serve as the watchdogs of the powerful minority by promoting independent journalism. They declare their independence from state-owned or corporate organizations by providing the news and information that people need to create their own opinions and to have a say in how their cities, regions, or countries are run [25,118,119]. Because of their importance to social and economic development, they are especially crucial in societies where press freedom and, therefore, active independent journalism, is lacking. On their website, the Media Development Investment Fund [118] states that 85% of the world—which means almost 7 billion people—live in countries without a free press, unable to trust the news they read, hear, or see. Many of these countries are exposed to media capture that occurs when the news media promotes the commercial or political interests of the state and/or nonstate interest groups governing the media industry, instead of holding those influential groups accountable [120-122].

Despite the political aspect of independent media in different media systems, the term, as such, gets increasingly difficult to define as new digital opportunities via the Internet emerge that promote independent journalism [25,119]. Other forms of media outlets, beyond public and private media, have adopted the term "independence" in different ways, as they also use the term to illustrate their distance from the mainstream conventions and the prevailing powers of the media industry itself [119,123]. In this case, the term "independent media" is used for specific, often industrial, media formations, e.g., independent television, independent music, or independent newspapers. Here, the abbreviation, "indie", is commonly used in this context to indicate that a particular type of company, publication, press, or studio, is independent media [25,124,125].

These independent organizations, mostly grassroots organizations, are referred to as alternative, nonprofit, noncorporate, radical, and subversive, and "doing things differently" is at the center of their operations [25,119]. Important to mention here is that these specific coherences, with their institutional and aesthetic traditions [126-128], are strongly rooted in Western popular culture and liberal democracies, and so the relevancy for its meaning cannot be transferred to every political system and culture across the globe [25,119].

Compared to larger mainstream organizations, where job security and roles are, for the most part, ensured, members of the independent print media enjoy autonomy, choice, and individual independence as workers. This translates to creative freedom, which is often expressed in the media's aesthetics and taste codes, which in turn can be converted into cultural capital that leads to symbolic value for the consumers [25,46]. Working for freedom often merges into working for free, as independent media lack the institutional support mechanisms of large media organizations [25,36]. However, the distance from the institutional and corporate constraints of the legacy media can be leveraged towards empowering powerful audiences and communities [129-132] and allowing stories to be funded that would otherwise not be covered. Therefore, for the independent media, the proximity to, and the identification with, a specific crowd to create meaningful products that are, at the same time, contributing to a certain (sub)culture, can be greatly leveraged to pursue a purpose [36,46].

Thomas [133] considers independent magazines to be those that are published without the financial support of a large cooperation or institution, in which the makers control the publication and distribution. This also gives the "maverick" editor or publisher the freedom to continuously explore different fields and discover new ways of doing things without commercial direction [77,133]. Independent publications are made by people that are often producers, designers, retailers, and promoters at the same time, and who put their passion and talent into publishing content outside of the mainstream. Indies inspire readers on a small-scale and inform them about the noncommercial niche activities off the radar. An exclusive material object, such as print, becomes a matter of desire, of physical gratification for the producer and the reader and, at the same time, becomes a symbol against the dematerialization of the new technological age [113].

Scholars use the term "alternative" to describe the kind of media that does not belong to the mainstream. This category of media is also defined as "citizen media" and "activist" media. Atton [134] underlines that alternative media should be rooted in the cultural patterns of an independent media outlet and should display at least some of the following attributes: the use of modern, evolving technology; horizontal communication patterns, the so-called "horizontal linkages" ([134], p. 27); a strong aesthetic form; innovative, alternative, and independent distribution methods; and de-professionalized organizational norms and roles [134-136].

"Independent media", which combines all these terms and refers to the "autonomous ownership model", also expresses the possibility of self-rule over the existing content ([135,136], p. 5). Independent media are not necessarily independent in the strict sense of the term. "Independent", rather, means being "separated from commercial and corporate interests" ([137], p. 338). Rauch [138] portrays the relationship between alternative and mainstream media as "interdependent, antagonistic, fluid and contingent" (p. 758) and, furthermore, emphasizes that alternative media can only be illustrated and understood in relation to mainstream media.

There are some important differences between independent media and mainstream media [136,139]. Independent media involve reciprocal communication, and there is the possibility of participation in the creation of content. Mainstream media, on the other hand, tend to be constrained by bureaucracy and financial obligations, which is not the case with independent media. However, significant differences also reside in terms of critical content and social motivation [138]. The power of independent media could lie in its agenda-setting by highlighting topics that are not covered by the corporate media [140].

Independent media must have a certain audience. Furthermore, independent media need to find the right kind of audience, an audience that is attached to the industrial, aesthetic, ethical, and sociopolitical ideas of that media, as Bennett [141] points out. As a result, independent media are often associated with certain subcultures. Independent media become much stronger when there are opportunities to communicate. When the less powerful and politically marginalized have access to the media, it has a significant impact on the diversity of information available [135,136]. When a society is more democratic, those who have less power can also speak out in different media, especially the so-called "alternative" media [122,142].

Many of the indie magazines choose print as their main medium [133]. One reason for this could be the indies' (nonconvergent) response to the "convergence culture", "the flow of content across multiple media platforms", as introduced by Jenkins [143], and another could be in the incentive of material culture and the construction of a community of desire [133]. Moreover, indies have also identified specific elements, such as the quality and tactility of the paper, or print-specific graphic design that cannot be reproduced by a digital screen. Nevertheless, especially for independent brands that proactively choose to not receive any financial support from a larger entity, print (compared to digital) is an expensive medium to choose.

2.3 Fundraising for Media

Pinterits [144] identifies that emerging multichannel retailers that mainly use E-commerce (online) channels to make sales generally generate revenue directly or indirectly, as well as in transaction-dependent and transaction-independent ways. Direct revenue generation is when the consumer of a product or service pays the producer for it directly. Indirect revenue generation describes models in which it is not the consumer that is charged for a product or service other than the primary operations of the business, but a third party, such as a sponsor or advertiser. The difference between transaction-dependent and transaction-independent revenue is connected to whether a payment is related to a specific transaction or is, rather, based on another factor, such as a monthly fee [144,145].

Because of rapid technological advancement, business models for new media that provide the potential for a public sphere in which people can participate in well-informed nonhierarchical debates are in constant transformation [146]. This also has effects on the interactions between the users and the activities on the Internet. Individuals actively take part in the production of media and express themselves through blogging, websites, by uploading photos and videos, and other user-generated content [147]. The ability of media producers that are designers, artists, software engineers, and journalists to develop new projects [148-150] is their biggest resource and is based on their human capacity and a digital platform or application [151-153].

When looking closer to free journalistic projects, such as magazines, newspapers, books, or other publications, crowdfunding (explained in more detail in the next section) is a common way to collect enough funding to pursue a purpose. The increase in the usage of crowdfunding in journalism is mostly based on the digital developments in which labor and the production processes are more distributed across different parties on digital platforms. Rather than being the main way to finance a project, crowdfunding mainly represents an additional revenue source to the traditional funding models of journalists and publishers, such as direct sales, subscription, and/or ad placement [37,121,122,154]. Popular platforms,

such as Kickstarter or Indiegogo, that do also accept projects from other branches, are much more used to launching campaigns for journalism-related projects. Aitamurto [37] claims that "the power of crowdfunding as a revenue model comes from the quantity of relatively small donations, ranging from $5 to $20." Here, money is raised for different types of journalistic productions, e.g., single stories, continuous coverage, or new publications. The crowdfunding platforms allow online communities to come together around a shared project and can create "new social interactions that motivate the crowd to participate in the funding of a projects, offering feeling of connectedness to a community with similar interests and ideals' for crowdfunders" [2,69]. Next to collecting the money, crowdfunding creates additional value in several ways, namely, by sensing the potential interest among the audience, branding in the form of brand attention, finding knowledge for the story in the form of contributions, and building an audience [37].

3. Research Methodology

On the basis of the outlined literature review, the research question of this paper is apparent: If independent print media make the decision to use crowdfunding as an alternative financing method, which type of crowdfunding is selected? Furthermore, whether the choice taken is in the best interest of the intentions of the publication should be evaluated and discussed. As an added focus of the study, the different benefits arising from crowdfunding should be exploited for independent print projects. To assess the research question at hand, in a field where information is scarce, a qualitative approach is recommended to generate a first in-depth insight [155]. Qualitative expert interviews provide details about singular cases [156,157]. As this study is aiming to give a general overview of the subject matter, case examples are the preferable empirical method of usage [158,159]. In contrast to case studies, case examples provide objective information about a multiplicity of cases without the researcher being directly involved or highlighting a single phenomenon in detail [155,160].

Considering the multiple options of CF platforms that can be used to launch CF campaigns, as well as the lack of literature about independent print media in this matter, it was helpful to conduct our own desk research. Identifying cases led to an overview of the discovered campaigns and identification of the coherences among them. The research follows a deductive approach, as preexisting data is gathered to investigate coherences and patterns. As a support tool, Microsoft Excel has been used. A total of thirty independent print media crowdfunding projects were analyzed, as this quantity was considered expressive enough to identify relevant patterns and recurrent findings. To draw conclusions on the development of a specific print magazine, the focus was set on discovering outlets that have accomplished growth up until now.

Different steps of gathering and mining data were used during this study. Firstly, two of the most used international reward-based crowdfunding platforms with creative and commercial focus—Kickstarter and Indiegogo—were identified as appropriate for discovering relevant campaigns. The available filter options of the platforms were used to identify relevant campaigns. Other crowdfunding platforms were discovered by searching directly for existing independent print magazines via Google, supposing that the outlet used crowdfunding to fund the project. Performing a keyword-based search on Google based on "independent magazines

crowdfunding" brought up 707,000 results and helped to identify relevant articles and blogs. In these cases, independent magazines commented on the meaningfulness of crowdfunding for their project launch causes, indicating that they used this method to finance their projects. Kicktray. Available online: https://kicktraq.com/ (accessed on 10 May 2021), a web-based analytics tool that simplifies the tracking of Kickstarter campaigns, was also used to discover relevant crowdfunding campaigns. Most of the relevant information has been obtained from the project overview on the landing page of the respective campaigns. The starting and ending date were identified by updates or the comment rubric of the individual campaign pages. Other important data has been gathered on the website of the magazine (e.g., potential spinoff projects, web shop, or the current issue published).

To illustrate coherent outcomes on the "funding goals" and "funding volumes" of the campaigns, EUR (€) was considered as currency. Therefore, the OANDA currency converter was used to convert the foreign currency of some campaigns into EUR (€). The currency rate of the last day of the month in which the respective campaign finished was used to convert the currency in order to compare the campaigns at hand on an equal basis.

4. Results and Discussions

As described in the methodology, the data of the applied secondary research are summarized in Table 1, which is separated into two segments to describe the relevant research findings. As seen in Table 1, we have analyzed thirty independent magazine outlets, mainly from Western countries. The second column (from left to right) displays the names of the respective magazines so that the data within the following columns can be attributed to the outlets. The third column shows the respective CF platform that was used to launch the campaign of the media outlets. Kickstarter was the most used platform for launching and funding their projects, being preferred by nineteen out of the thirty outlets. Among the other platforms, we mention Startnext (5), Indiegogo (3), Crowdfunder (1), Ulule (1), and Pozible (1). The campaigns were launched beginning in 2016, while the implementation took an average of one month to accomplish. The purposes of the CF campaigns were predominantly aimed at publishing and printing the first print issue of the respective media outlets (Column 6).

Table 1. Observed Independent Print Media Crowdfunding Campaigns.

#	Outlet	CF Platform	Launch	Duration	Location	Purpose
1	Ethos Magazine	Indiegogo	16 October	1 month	UK	P + P1I

As Table 2 depicts, the thirty campaigns have gathered about 8276 supporters/backers, meaning an average of 276/campaign. While most campaigns were successful, some of them did not reach the expected funding goals, ranging from 22.77% in the case of Puss Puss magazine, to 213.45% for Ladybeard. Most of the campaigns exceeded the initial goal by only a few percentages. On average, the crowdfunding campaigns were successful, collecting a total of €379,027 (108.58%). The average amount that was the aim of the campaign launchers was €11,636. The average founding volume that was eventually reached by the CF campaigns was €12,634. Column 6 shows the actual (newest) issue of the print magazine. On average, the outlets have launched 16 issues since their CF campaign. In the last column, spin-off projects that were developed besides the print magazine are shown. The column demonstrates that most of the spin-off projects are either agency or studio projects, but other media arms *(podcasts, workshops)* were also created. Every campaign that was looked at in the table has been categorized under reward-based crowdfunding campaigns.

Notes: % FFG: percentage of fulfillment of initial funding goal; N/A: not available. Source: the author's own development based on the crowdfunding platforms.

The observed cases reflect the spectrum of media diversity, as also discussed by Thomas [133]. A cultural and sports focus can be witnessed when monitoring the content perspective of independent print media, which is in line with the findings of De Voldere and Zeqo [161]. The publications highlight their independence and freedom [25,45,46,119,141]. While the distribution of launched crowdfunding campaigns for independent print media in the last years stayed the same, the study at hand confirms the dominance of Kickstarter in the reward-based crowdfunding sector, as outlined by Hrenyk and Grant [162]. A strong linkage between projects in the Western hemisphere and Kickstarter could be observed as well. Reward-based crowdfunding offers shorter funding and commitment periods than equity-based crowdfunding but, then again, offers the supporters more in return than donation-based campaigns [33,83,84]. From an organizational perspective, the research confirms the findings of Karppinen and Moe [119] and highlights the fact that most independent media organizations are organized in a lean and grassroots manner.

Out of the funding behavior of the independent print media analyzed, a mixture of methods can be observed. This can also be related to one of the main goals of independent organizations: to stay independent. Taking the framework of Meier and Stormers [163] into consideration, the aspect of selling the publications is complemented by the crowdfunding approaches, which primarily finance the printed media products. This also ties into the discussion about the usage of crowdfunding for preordering products [30,164]. Media publishers using crowdfunding are, therefore, able to estimate the demand before producing the final products. Another method of funding, placing advertisements in the publications, is lacking acceptance in the independent print media space, which underlines the findings of Eldridge

[165], as well as Lovett et al. [166]. This can have two main reasons: the magazines want to preserve their independence, and the circulation is not high enough to attract advertisers.

The observed publications use crowdfunding not solely for raising monetary funds, but also for generating feedback and new ideas, as well as for triggering a marketing effect in terms of awareness and reach generation [31,32,104]. Moreover, the observed organizations tend to build up communities by applying crowdfunding techniques, which serve them as a starting point when launching new follow-up campaigns [167,168]. The use of external agencies to assist during crowdfunding campaigns, as outlined by Behl et al. [111] and Du et al. [112], could not be observed in the sample. A possible reason could be that the lean teams prefer to manage the campaign in-house, not spending funds on third-party support, which might not benefit the campaign to a large extent. Banks and investors, as important long-term partners for running media operations, can be presented market proof and traction by successful crowdfunding campaigns [97,98,169,170]. Independent print media use crowdfunding campaigns to present a benefit to supporting artists, journalists, and their affiliates from the marketing effect, but also offers them exposure in exchange for their work and commitment [171,172].

Conclusions

The main research aim of this study, empirically based on the examination of case examples, was to focus on the type of crowdfunding that is used by the independent print media. Furthermore, the best-fitting crowdfunding types, as well as other benefits stemming from the crowdfunding engagement, were analyzed. Observing the gathered and discussed data, the conclusion can be drawn that every crowdfunding campaign used for independent print media offered rewards (presale of magazines, merchandise, advertisement spots, etc.). As the goal of the crowdfunding campaigns of the independent print media are printed magazines, and the independent media organizations often rely heavily on a nonprofit approach, the reward-based crowdfunding approach seems better-suited than other monetary-driven campaigns.

Independent print media aimed at producing regular publications, especially, were using crowdfunding the most. Data about the current issues of the media being advertised on the respective websites signals the success of the method, which subsequently strengthens the regular production of the magazines. The mentioned publications are using the network effects of the community to drive awareness and monetary support for their future published issues. It seems remarkable that independent print media mostly use crowdfunding for the launch of the media as well as the first issue. It might be the case that the organization, thereafter, is able to identify other ways to raise the necessary funds for future publications. Some media seem to use crowdfunding as a community and loyalty tool to keep in touch with customers, and benefit from their network as well as the feedback.

Observing the platform usage of campaign runners, Kickstarter is the dominant platform for independent print media, according to the study. The reasons can vary, from the historic growth, the success stories of campaigns on the platform, and the support for innovative and creative projects with far international reach. On the other hand, independent media often refer to the local culture in their content and choose local platforms for their crowdfunding to be able to reach a local audience.

The average duration of only one month for the crowdfunding campaigns indicates that the print products are already finished in digital desk publishing but need to be reproduced. This is also indicated in several of the campaigns and signals the effort that the teams put into the projects, relying heavily on intrinsic motivations. A total of 90% of the funding goals (27 out of 30 projects) were reached, which indicates the willingness of the supporters to back independent media. Therefore, the loyal and emotionally committed community can be used for future community-building approaches. Besides benefitting from the community building and the marketing effects, the campaign runners can also gain advantages from the feedback of the supporters, as well as from the image gained by a crowdfunding campaign. A crowdfunding campaign, although it involves a lot of hard work within an organization, can pay off in the long term.

From a theoretical perspective, this study extends previous knowledge in the field of general communication theory, as platform-driven crowdfunding might be considered a new technology that is also used as a communication tool. We also add value to the network society theory, as crowdfunding can be regarded as a network instrument, and/or a strategy, aimed at helping investors and/or different organizations, via specific platforms, gather the relevant funds, not only to begin their businesses, but also to grow. Crowdfunding platforms have the potential to bring together interested investors, who are striving to diversify their investment portfolios, with entrepreneurs eager to innovate and implement new business ideas, but who lack funds. Our research serves as an extension of the case example approach to the industry of independent media organizations running crowdfunding campaigns. It also shows another application for the mentioned research method, while the research done shows the acceptance, as well as the joint power, of crowdfunding projects, looking at an average of 276 people funding the projects.

From a managerial perspective, the paper serves, first and foremost, independent media organizations running, or thinking about running, a crowdfunding campaign. It provides hints about the preparation, the setup, the execution, as well as about the control of the campaign, while also arguing that crowdfunding campaigns seem like a viable option for raising funds. Furthermore, the study gives insights for closely related stakeholders, such as the crowdfunding platforms, the supporters, as well as the banks and investors, as to how they can more easily connect to each other, develop new businesses, and more efficiently allocate resources for mutual benefit. Additionally, external crowdfunding agencies benefit from the case example approach. It is also interesting to see that some media organizations could successfully spin off projects from their crowdfunded publications and use these for cross-financing.

The study is limited in various aspects, which could provide the subjects for future studies as well. Independence, in the meaning of freedom of press, is mainly a topic of interest in the Western hemisphere and the research was focused on publications from Western societies. Other societies, for example, Japan and India, present suitable ground for the crowdfunding of independent media publications. It should be noted that only successful and efficient crowdfunding projects have been observed and analyzed in the study. To successfully run crowdfunding platforms, managers must consider specific conditions: a keep-it-all approach for independent print media seems to be highly target-oriented, thus allowing for proper financing opportunities. The editing or print products can be more easily adjusted, especially if the research, protoype, or the development of new products are subject to financing.

Furthermore, the study is limited to thirty case examples that are all set in the print media area. The COVID-19 pandemic could have had an influence on the crowdfunding efforts in this space. Besides these fields of future research, upcoming studies could focus on the quantitative studies on independent print media. Qualitative expert interviews could enable more insights for a better understanding of the phenomenon at hand. Future studies could also investigate the characteristics of investors when relying on crowdfunding, as well as taking into consideration crowdfunding initiatives in other industries.

CHAPTER 29

‘Let’s Keep Music Special. F—Spotify’: On-Demand Streaming and the Controversy over Artist Royalties

Lee Marshall

Creative Industries Journal 8, no. 2 (2015): 177–89. https://doi.org/10.1080/17510694.2015.1096618.

Abstract

On-demand streaming music services have expanded significantly in recent years. Services such as Spotify and Deezer are widely expected to become the dominant means of mass music consumption in the future and have been significant factors in helping recording industries in some countries arrest their long-term decline. The emergence of such services (especially the largest of them, Spotify) has caused controversy, however, with both major stars and smaller independent artists publicly criticising the low levels of royalty payments such services have thus far generated. This paper provides an overview of the controversy, concentrating on the criticisms of Spotify from independent labels and musicians. In such a rapidly moving sector, it is unwise to offer any definitive predictions and thus the purpose of this paper is to outline as clearly as possible the parameters of the current debate. To achieve this, it considers the business models associated with streaming music and their place within the contemporary recorded music ecosystem, most notably in relation to piracy and declin-

BY-NC-ND

ing record purchases. It concludes with a consideration of streaming services in relation to the broader power dynamics of the recording industry suggesting that while services like Spotify may cause problems for independent musicians they rely upon a logic of scaling that correlates with the existing practices of the major record labels.

Introduction

One thing that the history of popular music tells us is that the introduction of significant new technologies is rarely uncontroversial. New inventions, such as the microphone (Frith 1986) or the sampler (Theberge 2004) get challenged and ridiculed by parties whose interests may be threatened by new social practices of music-making and music-consuming. A recent example of this kind of conflict is the controversy over the amount of payment being given to artists for allowing their music to be made available on streaming services such as Deezer and, especially, Spotify. It is a controversy that periodically appears in the mainstream media, such as Radiohead singer Thom Yorke's proclamation that Spotify is the 'last gasp of the old industry… the last desperate fart of a dying corpse' (Dredge 2013) or Taylor Swift's decision to remove all of her back catalogue from the service upon the release of her 2014 album, 1989 (Dickey 2014).

The controversy is not merely a few superstars grumbling, however, as the majority of concerns have actually been raised by independent artists several rungs down the music industry ladder. While such discontent could perhaps be assumed to be merely an economic spat about how the pie should be divided, it actually reflects more deep-seated uncertainties regarding the changing nature of the music commodity and its impact upon the perceived value of music, as well as more long-standing issues regarding the dominant power relations within the music industry. This latter point is notable because it contradicts a common perception that the disintermediating nature of the internet should be a boon to musicians beyond the major label system (for example, Baym 2011; Wikstrom 2009), with the emergence of 'long tail' economics (Anderson 2007) enabling unsigned artists to sell their music to a wide audience. However, the seemingly inexorable shift to streaming services has the potential to be a way through which old industry structures reassert themselves. Yorke is thus correct to associate Spotify with the 'old industry' but perhaps premature when describing it as a 'dying corpse'.

An introduction to streaming services

Before outlining details of the controversy, it is important to differentiate streaming music services. Often generically referred to as 'music in the cloud' (Morris 2011), streaming services can be split into three types. The first is streaming radio (sometimes referred to as webcasting). This can simply be an online version of existing radio services, or online-only radio stations that specialise in particular genres or localities, but the more distinctive form is personalised, in that the service selects songs to play for each individual listener based on previous listening preferences. This kind of streaming radio service thus provides a more bespoke experience than broadcast radio but, in comparison to other kinds of streaming service, the important characteristic is that it is non-interactive: the listener does not choose what songs will play. The most established streaming radio service is Pandora, which announced in April 2013

that it had 200 million registered users in the United States, 70 million of which were 'active' each month (Peoples 2013).[1] The majority of Pandora's income comes from advertising but it also has 2.5 million subscribers paying a monthly fee to avoid ads and listening limits. Another prominent player in this field is iHeartRadio, a mixture of traditional radio services and Pandora-like tailored recommendations, created by terrestrial radio provider Clear Channel,[2] and boasting 50 million users (Solsman 2014).

The second kind of streaming music service are locker services, such as iTunes match and Amazon's Cloudplayer. In these services, users can listen to 'their' music directly from the internet, either songs that they upload directly to the service's servers or that are automatically 'matched' (to, for example, a user's Amazon CD purchases). Locker services thus offer mobile access to a listener's entire MP3 collection. However, they are a relatively small part of the cloud-based music landscape and, in all likelihood, a temporary phenomenon, designed to ease consumer experience until the 'purer' forms of cloud-based services are adopted more widely.

The third kind of streaming music services are 'on-demand'. Such services are similar to streaming radio services, such as Pandora, with one crucial difference: the listener chooses what music is played. They are thus interactive rather than non-interactive. As such, they provide a listening experience similar to locker services, except that choice is not limited to an individual's collection: instead the listener can choose from a vast catalogue of music (upwards of 30 million songs on some services). Spotify has established itself as the most famous of these services but there are other significant providers. The most important of them is Deezer, the second largest on-demand service with 16 million active users and 6 million subscribers (Peoples 2014). It has garnered fewer headlines than Spotify because it has strategically avoided entering the mainstream US market but is the most global service, available in 180 countries. Other services include Rhapsody (until the emergence of Spotify, the largest subscription service in the United States, with 2 million subscribers), US-based Rdio and WiMP, based in Norway.[3]

On-demand services often include radio functions so there is some overlap between services but the most important distinction is the one between non-interactive and interactive services. Within the music industry, it is widely accepted that on-demand services are heralding a significant reconfiguration of recorded music consumption, from being based on ownership of music to being based on access, renting rather than buying records. This acceptance reflects the manner in which streaming music has begun to enter the mainstream in recent years. This can be seen in the global expansion and accelerating growth in user/subscriber figures among the aforementioned services but, probably more significantly, in the way in which the major internet companies are now becoming involved in the on-demand streaming market. For example, Amazon offers a limited streaming service as a benefit to subscribers of its Amazon Prime service, while Google actually provides two streaming subscription services: Google Play Music All Access and YouTube's Music Key service.[4] On top

[1] Pandora was available only in the United States until December 2012, when it launched in Australia and New Zealand and where it now has 2 million listeners.

[2] Clear Channel has subsequently changed its name to iHeartMedia.

[3] WiMP has subsequently been purchased and rebranded as Tidal.

[4] Although often not recognised as such, YouTube is actually the largest music streaming service, and is the de

of this, Apple, a long-time rejecter of streaming music, purchased Beats Music (primarily a headphone manufacturer but with a small on-demand streaming music service) in May 2014 and launched its own on-demand streaming service in June 2015.

The backlash against Spotify

The broader issues discussed in this paper, concerning the changing nature of the musical commodity and the economic reward for recorded music, are applicable to all of the on-demand streaming services. This paper will focus on Spotify, however, given that it is the most prominent of such services and the one which has been the centre of public debate about the levels of remuneration received by artists for streaming. The service was launched from its native Sweden in 2008 and it currently offers a catalogue of 'over 30 million tracks' in 58 countries (Spotify 2014). In January 2015, Spotify announced that the service had achieved 60 million active users and 15 million paying subscribers (Spotify 2015). Its growth in subscriber numbers has been impressive: according to public announcements, it took almost 2 years to get its first 500,000 subscribers but then added 2 million in approximately a year, a further 3.5 million in the following 18 months, 4 million more in the next 14 months and 5 million more in just 7 months. It is growing exponentially and is the poster boy of the new, optimistic, digital record industry—the one that has stopped bleating about piracy and is doing something new and funky. Yet despite, or perhaps because of, its success, Spotify has also received a large amount of criticism, most notably from artists about the levels of remuneration they receive from the service.

The public discussion of Spotify payments first began in 2009, when it was widely reported that Lady Gaga had received a payment of just $167 for her song 'Poker Face', which had been streamed over a million times (for example, Smith 2009).[5] The statistic was misleading[6] but the mud stuck—it is easy to find recent stories repeating the bogus fact (for example, Marsden 2012)—and the idea that Spotify did not adequately reward artists gained public credence. It was around the time that Spotify launched in the United States in 2011 that the controversy surrounding payments became more consistent as a number of smaller US record labels withdrew their catalogues from the service. Seemingly, the first to do so (though not the first to announce it) was Projekt Records, a Brooklyn-based gothic rock label, formed in 1983, which withdrew its catalogue from all on-demand streaming services in July. Label founder Sam Rosenthal stated that these services 'are not a viable way forward for the music industry' and was vocal in his criticism of Spotify:

> In the world I want to live in, I envision artists fairly compensated for their creations… Spotify is NOT a service that does this. Projekt will not be part of this unprincipled concept. For a stream on Spotify… on average $0.0013 is paid to Projekt's Digital Distributor. 5000 plays generates around $6.50. In comparison, 5000 track downloads at iTunes generates $3487. … To earn the U.S. monthly

facto source of music listening for significant numbers of young internet users. It has approximately 140 million weekly music video users (Mulligan 2014a).

[5] For the original Swedish news story, see Andersson (2009).

[6] The amount related to songwriter's publishing royalty only (not the income from the recording itself, which conventionally is about nine times higher), after collecting society deductions, for a song that was co-written, covered only a short period of time just after Spotify had launched and related to streams in Sweden only (see Barnett 2010).

> minimum wage—$1160—892,307 plays a month are needed at Spotify. This is not a viable number for artists. (Rosenthal 2011)

The next label to pull its catalogue out of Spotify, and the first to be publicly reported, was Century Media, a metal label based in Dortmund and California. In August, they announced the withdrawal of its repertoire, along with its associated labels, 'to protect the interests of its artists'. While praising Spotify as 'a great tool to discover new music', Century countered that:

> Physical sales are dropping drastically in all countries where Spotify is active.… Since the artists need to sell their music to continue their creativity, Spotify is a problem for them. This is about survival, nothing less and it is time that fans and consumers realize that for artists it is essential to sell music to keep their heads above water.

Century concluded that:

> Spotify in its present shape and form isn't the way forward …. Ultimately, in some cases, it will completely kill a lot of smaller bands that are already struggling to make ends meet. (Century Media 2011)

More label withdrawals followed. Curiously, metal labels, especially LA-based metal labels, seemed the most keen to remove their catalogues from Spotify. In September 2011, Napalm Records withdrew their repertoire, stating that 'the income generated through streaming is so insignificant that neither we, as a record company, nor our artists are able to further support this method of distribution. We… object to price models that endanger our existence and that of our bands' (see Metal Underground 2011). Also withdrawing in September 2011 were Prosthetic Records and Metal Blade, while Sumerian Records withdrew most of its catalogue in November. Beyond the LA metal scene, a more widely publicised story emerged in November when ST Holdings, a UK digital distributor for independent electronic and dance labels, withdrew from on-demand streaming services the catalogues for 234 of the 238 labels it distributed. In announcing their withdrawal, the company highlighted that, in the third quarter of 2011, their digital revenues dropped for the first time in their history (by 14%) and that iTunes income in particular was badly affected, falling by 24%. During the same period, on-demand streaming services accounted for 82% of 'plays' of their music, but just 2.6% of revenues, with Spotify returning £2500 for 750,000 streams. This low rate led the company to voice concern that the value of music was being undermined, stating that 'music loses its specialness by its exploitation as a low value/free commodity. Quoting one of our labels, "Let's keep the music special, **fuck Spotify**"' (in Resnikoff 2011).

The royalties debate and the changing nature of the musical commodity

It is important to keep these examples in context. The withdrawal of a handful of small independent labels is not going to cause too much of a dent in a catalogue of 30 million tracks.[7] It is also worth noting that some of these companies (such as Century) have subsequently returned their catalogues to Spotify. However, the controversy about the amount of money paid to artists by streaming services has continued, especially among some smaller independents and DIY artists.[8] Broadly speaking, the complaints can be characterised in two ways.

[7] Unless you're a fan of Californian metal or UK dance, in which case it really sucks.

[8] Perhaps most active is David Lowery, member of alternative rock bands Camper Van Beethoven and Cracker who has also worked as a financial analyst and derivatives trader. Lowery runs the blog 'The Trichordist' (sub-

First, musicians argue that on-demand streaming services undermine sales of digital files and physical media and, therefore, they are not a financial model that can sustain their musical careers. Underpinning this, however, is a broader aesthetic and moral argument about what music should be worth, with the micro-pay- ments generated by each stream being seen as devaluing music itself.

I will return to these issues shortly but, first, I want to outline the two ways in which Spotify has responded to such criticisms. The first is to argue that, for many artists, the amount that they receive from Spotify reflects their contract with their record label and not the amount that Spotify pays out (e.g., in Rosenthal 2011).[9] There is some truth to this and it is important to recognise that the question 'how much does Spotify pay artists?' is somewhat misleading given that Spotify does not 'pay artists' any more than a physical record store 'pays artists'. Instead, Spotify pays labels, or distributors handling labels and, as such, what proportion of that money is returned to artists is a matter of individual (though often standardised—see Stahl 2013, 165–170) contracts. It is necessary to be cautious, therefore, of information circulated online about the amount a particular artist received from streaming. However, there is obfuscation in Spotify's response also.[10] Not all of the artists raising concerns have record label contracts, with many instead using digital distributors that charge a flat rate commission which makes it possible to ascertain what Spotify actually paid out. A large number of these independent artists have made significant efforts to provide reliable data on streaming rates (for example, the cellist Zoe Keating and the aforementioned David Lowery, who maintains a 'streaming price bible' on his Trichordist blog). Furthermore, the fact that independent labels, and not just individual artists, have been complaining about the revenue received from on-demand streaming suggests that the low level of income received by artists is not just a matter of exploitative contracts.

Aside from claiming contractual confidentiality, Spotify's main public response to the issue of royalties has been to provide some really big figures—the global amount that it has returned to rights holders. In 2012, Spotify founder, Daniel Ek, stated in an interview that 'the whole debate about artists payments is slightly misconstrued. We have paid out over half a billion dollars to rights holders now, and that's doubled in the last nine months. That's a significant amount of money' (in Dredge 2012).[11] The word 'misconstrued' is quite deliberate because the argument being made is that artists and the media are wrong to treat on-demand streaming services as comparable to sales. Spotify has repeatedly argued that it 'does not sell streams, but access to music. … [It] is not a unit based business and it does not make sense to look at revenues from Spotify from a per stream or other music unit-based point of view. Instead, one must look at the overall revenues that Spotify is generating' (in Houghton 2011).

titled 'artists for an ethical and sustainable internet'), where he provides analytical and provocative posts on a range of music industry issues.

[9] Recently, Spotify has begun to subtly deflect pressure from itself onto the record labels, both by making streaming data directly available to artists (via its 'Spotify Artists' service) and through implicit public comments about the distribution of revenue.

[10] It should also be noted that Spotify's contracts with the major labels are subject to non-disclosure agreements which make it impossible to ascertain how much, and in what ways, specific labels are remunerated. It is commonly accepted that the major labels received lump sum payments for making their catalogues available on the service and that this income is not shared with artists.

[11] In Ek's public response to Taylor Swift, he announced that Spotify has paid $2bn to rights holders (Ek 2014).

Thus, the really really big or the really really small numbers get to the heart of those different ways of understanding streaming services.

To be clear, this is not merely an argument that it is impossible to equate a certain number of streams with one purchase. Rather, it is an argument that the nature of what is being sold is qualitatively different than in the past and, therefore, artists need to reconsider how they are rewarded—not merely how much they are paid but the basis on which they are paid: in the 'old' model of music-buying/owning, consumers paid (and artists therefore received) a one-off payment; in the new model of music-renting, consumers continually pay for access to music. The theory is that continual small payments will compensate (and more) for the withdrawal of the one-off payment. That is why Spotify argues that 'people need to transition from unit-based thinking to consumption-based thinking' (in King 2012).

The economics of streaming music

While Spotify's position reflects a broader cultural shift toward 'renting' music, its argument that musicians should move away from 'unit-based thinking' is seemingly undermined by the fact that musicians are paid on the basis of how many times their songs are streamed by the service. In fact, Spotify royalty statements list each stream and its associated rate (though Spotify refers to calculating per-stream rates as 'reverse engineering'). Understanding Spotify's position that it is wrong to focus on individual streams requires an understanding of the broader economic logic of streaming, which depends upon the totality of streaming rather than the aggregation of individual streams.

Before explaining Spotify's payment system, it is important to recognise that Spotify does not seem to be 'cheating' by paying a lower royalty rate than other digital suppliers. At SXSW in 2012, Spotify's chief content officer, Ken Parks, reported that the company pays out 'in the neighbourhood of 65–70% of revenue to rights holders' (in Peoples 2012a) and it has repeatedly affirmed that it pays 'nearing 70%' or 'approximately 70%'. The 70% figure is important because it is what Apple returns to rights holders for iTunes downloads and it broadly matches historically conventional allocation in the record industry.[12] So while not confirmed precisely, Spotify is at least paying rights holders a broadly conventional rate for the right to use music. It distributes money by dividing its total revenue by the number of streams played on the service. However, the amount of revenue Spotify generates relies mainly upon the number of subscribers it has (plus a little extra from advertising), whereas the number of times music can be streamed is effectively limitless. Thus, when this amount paid is compared to the overall number of songs streamed, the numbers look embarrassingly small—the broad average from the information posted online is about $0.004 per stream (0.4 or 0.5 cents per stream, although streams get different rates of return according to a variety of factors, most notably whether it is played by a subscriber or someone using the free service). Given the tiny figures quoted from musicians on per-stream basis, or the '30,000 streams only earned me $120' stories, it is understandable that musicians might be concerned about the amount of money they are receiving. How can Spotify suggest that streaming is a viable option for artists?

[12] The bulk of that 65%–70% is paid to the rights holder of the sound recording, with 10.5% (of total revenue) paid to owner of publishing rights for mechanical royalties and performance rights.

Spotify's answer to the question is scale. Given the company pays a fixed proportion of revenue back to rights holders then, as Spotify's overall revenue increases so, too, does the amount of money returned to rights holders (70% of a billion dollars is more than 70% of 10 million dollars). This means that scale is key to the viability of Spotify and similar services: the more free users it can convert into paying subscribers the greater the level of return to artists and labels, not because more people are playing their music but because there is a bigger pie to share out and the effective per-stream rate thus increases. This can actually be seen in the royalties data that has been shared online: whereas the average rate per stream was initially in the region of $0.002 to $0.003 per stream (as can be seen in Sam Rosenthal's statement quoted earlier), today it is $0.004 to $0.005. Ek announced in November 2014 that '500 thousand listens on Spotify would pay out between three and four thousand dollars' which is an effective per-stream rate of $0.006 to $0.008 (Ek 2014). The logic of the Spotify model has thus shown signs of working, though it remains to be seen whether services can scale sufficiently to provide a viable means of income for musicians. According to Spotify's artist-in-residence, D.A. Wallach, that particular tipping point is achievable, stating that 'if we can get to the scale of Netflix—which has 20 million subscribers—we estimate we'd be paying out to artists what iTunes is paying out on a year to year basis' (King 2012). [13]

Artists are thus being told that they are wrong to treat streams like sales and that they should adopt a patient, long run view. Yet while large labels with cash reserves can potentially ride out the storm, artists who need money to live on now argue that streaming is undermining their current income by cutting into their digital sales. Both Century Media and ST Holdings made explicit reference to the fact that income from digital sales had fallen dramatically since the emergence of on-demand streaming. Spotify's position, perhaps unsurprisingly, is that streaming does not have a detrimental effect on digital sales. For example, Katie Schlosser, a director of label relations at Spotify, has stated that they have been able to provide labels with 'data that's proving and demonstrating the fact that streaming revenue is additional to actual unit download consumption or physical music sales' (Resnikoff 2013). Perhaps more surprisingly, the argument has been supported by the major record labels. For example, at an IFPI event in London in 2012, then president of Universal Music Group's global digital business, Rob Wells, described the argument that on-demand streaming 'cannibalises' sales as 'absolutely bogus' (Peoples 2012b).

The year 2012 was a good year to claim that streaming does not undermine sales, as overall revenue for the recording industry increased for the first time this century, if only by 0.2% (IFPI 2013). There were also individual instances where streaming and selling seem to have complemented each other well. For example, one of the biggest albums of 2012—Mumford and Sons' *Babel*—became the most streamed album on Spotify in its first week of release ('around eight million listens') while simultaneously recording the highest first week sales for a US

[13] In 'Spotify explained' (2013), the company used 40 million subscribers as their basis for explaining the potential of the service for musicians. Two important provisos need to be made about this argument, however. The first is that it assumes subscription prices remain constant, but there are many commentators who think that, for streaming to really break though into the mainstream, lower price points will have to be introduced (for example, Mulligan 2014d). Second, it assumes that new subscribers are converted from existing free tier users. Spotify has thus far remained consistent in converting 25% of users into subscribers. If, however, the number of free users increases at a faster rate than the number of subscribers, then revenue compared to number of streams could conceivably go down rather than up.

album that year (600,000 units) (Peoples 2012b). Furthermore, there are specific territories where streaming has played a significant role in the local recording industry returning to growth after more than a decade of decline. For example, in Norway (where streaming accounted for 65.3% of recorded music revenues in 2013) the industry grew by 7.2% in 2012 and 10.6% in 2013 (IFPI Norge 2014) while in Sweden (where streaming contributed 71.2% of recorded music revenues in 2013) the recording industry has seen 3 years of consecutive growth (IFPI Sverige 2014).

Given their distinctive characteristics (small markets with high broadband penetration and the home of two of the major streaming services), it is unclear whether these Scandinavian examples are reliable indicators of future trends in much bigger music markets. Most notably, neither country had well-established paid download services prior to streaming services emerging (Mulligan 2014b). This makes them very different from the United States and the United Kingdom, where download services were contributing between 40% and 50% of recorded music income by the early 2010s. And, revenues from download sales declined in the United States for the first time in 2013 (Pham 2014) and the United Kingdom in 2014 (Titcomb 2015). Critics of streaming services were quick to attribute the blame to Spotify (for example, Titcomb's headline was 'UK music downloads in decline for first time as Spotify eats into iTunes sales'), though Ek (2014) contends that to do so is to confuse correlation with causation. Instead, he points to Canada, where download sales were falling before streaming services emerged. It should also be noted that growth in download sales had been flattening out considerably since 2008 (which Mulligan (2014c) attributes to increased spending on apps).

In the long run, it seems reasonable to assume that the changing nature of the musical commodity means that streaming will replace downloading but it is difficult to make predictions about the speed and the nature of the transition as current data is ambiguous. Nonetheless, 'while industry executives initially refused to attribute the early signs of weakness in digital sales to the rise in streaming, in the second half of 2013 many conceded that ad-supported and paid subscription services did seem to be cannibalizing digital sales' (Christman 2014).

Spotify and the mainstream industry

Despite concerns that streaming music could be undermining digital sales, the major record labels (Universal Music Group, Sony Music Entertainment and Warner Music Group) have been very supportive of both Spotify and on-demand streaming more broadly. Many of the bigger independent labels, such as Beggars Group and XL, have also been supportive of the service. The majors' support of Spotify is in stark contrast to the early years of the twenty-first century, during which they were hostile to the emergence of digital music and ultimately had to be bullied by Apple into committing themselves to the digital marketplace (Knopper 2009, 170–177). What has changed in the meantime to effect such differing responses? [14]

Understanding the change in attitude requires understanding the changing contours of piracy in the last 15 years or so. In the early twenty-first century, the record industry's

[14] It should not be assumed that the major labels' reaction to Spotify was uniformly positive. In particular, there was resistance to the idea that access to music should be free and, before launching in the United States, Spotify implemented some limits on the amount of music that could be listened to by non-subscribers. These limits have since been removed, however.

overwhelming concern was that digital files generated massive amounts of piracy which undermined legitimate sales. Initial responses to these developments involved searching for ways in which music could be 'locked' through Digital Rights Management systems and aggressive litigation campaigns, against both companies involved in piracy (such as Napster) and individual downloaders (Marshall 2012). Around 2005, however, the record industry changed its approach to online music consumption. While still publicly criticising piracy and campaigning for improved copyright enforcement, the record industry apparently accepted that it would have to adapt to consumer behaviour. The challenge for the labels was finding a way to incorporate the behaviour of a generation which had grown up with music being free and accessible. This has been Spotify's key selling-point: it has consistently presented itself as offering a platform which 'monetises' existing consumer behaviour. In its response to the withdrawal of the Century and Mute catalogues, Spotify stated that the service:

> was launched out of a desire to develop a better, more convenient and legal alternative to music piracy. Spotify now monetises an audience the large majority of whom were downloading illegally (and therefore not making any money for the industry) before Spotify was available. (in Bruno 2011)

The connection between Spotify and piracy is less than coincidental: Spotify founder Daniel Ek was formerly CEO of uTorrent, the most popular client for bittorrent sharing and the Spotify software itself depends on the peer-to-peer technologies that facilitate widespread file-sharing (when a user requests a song, encrypted data is transferred from other users' computers) (Greeley 2011). Despite this heritage, however, a major selling point of on-demand streaming services is that they are generating income for rights holders out of consumer behaviour that had previously generated none. [15]

However, surely the main reason for the major labels' support of Spotify and similar services is that the 'consumption-based' logic of streaming services actually fits the logic of the pre-digital record industry quite well. The success of the major labels has always depended upon 'consumption-based' rather than 'unit-based' profits; their strategy was to release lots of records in the knowledge that only a small number of them would be successful but that the rewards from a small number of hits would outweigh the losses of the remaining releases. Thus, from the major label's perspective, so long as some records made a profit, it did not matter which records sold a lot and which did not. It mattered to the careers of specific individuals (the artist, say, or the A&R executive that signed them), but not to the label overall, whose success depended upon overall levels of music consumption.

The correlation between the 'consumption-based logic' of the major labels and streaming services can be seen in the way that royalty payments are calculated, which is inherently beneficial to those with large catalogues. Spotify's payments are based on a 'market share' system. Simplifying slightly, the basic logic of the system is that an artist is paid a percentage of Spotify's overall revenue determined by the percentage of overall streams that the artist

[15] There is not space in this paper to evaluate the claim that streaming monetises 'pirate' behaviour. There are certainly examples of countries, most notably Spain, in which rates of piracy have reduced as adoption of streaming has increased. There is also some consumer survey data which also suggests a connection between increasing streaming services and declining rates of piracy (for example, NPD Group 2012). Ek's aforementioned caution about confusing correlation with causation should be noted, however, given that other factors, such as the dramatic rise in web takedown notices and the growth of YouTube, will have played a part in declining piracy rates.

accounted for in a particular month (Spotify 2013).[16] There is thus no connection between an individual listener's payment and their listening preferences. This is beneficial to artists and labels who receive a high number of streams because it means that they receive a high proportion of income regardless of how many paying users actually streamed their music. For example, if a listener pays £10 but listens to only one obscure Finnish rapper for the entire month, the rapper will still only receive a very small proportion of the listener's money as the majority of it will be distributed to those artists at the top of the Spotify charts. Independent and less popular artists would benefit from an alternative system of payment that directly distributed an individual's subscription to only those artists to which the individual had actually listened.

Conclusion

The specific complaints about royalty rates raised by independent musicians and labels reflect, after a period of uncertainty, some significant structural recalibrating of the recording industry. Rather than internet technologies providing liberation from old industry dynamics, what we may be seeing is a consolidation of long-established power structures (as predicted by Bukart and McCourt (2004) though not via the precise mechanisms they suggested; see also Rogers 2013). Furthermore, the introduction of streaming may be making the ground outside of the mainstream even more uncertain given that independent artists and labels do not have the luxury of extensive back catalogues and are much less insulated against declining sales. If streaming is 'cannibalising' sales, therefore, it will be disproportionately impacting upon smaller players. Artists signed to bigger labels can be insulated against the changing rhythms of payment for recorded music—if, say, it takes 5 years of streaming income for an album to recoup its costs rather than 2 years of sales income, those with larger catalogues/financial reserves will be able to weather the storm. However, even if streaming services can scale sufficiently to offset the global decline in incomes from record sales, Spotify's current payment system seems skewed towards the major labels.

Thus, despite the seemingly radical shift from ownership to access-based models, the business model of on-demand streaming is one with which the major labels are familiar and which suits their existing strategies. It is unsurprising that they have been supportive of the new services. Indeed, this support has gone beyond the realm of public statement as the major labels are actually shareholders in Spotify: financial filings reported in 2009 state that the major labels have a 16.5% in Spotify, with Merlin, an aggregator for the biggest independent labels, owning a further 1% (Arrington 2009; Jerrang 2009).[17] Furthermore, in late 2012, Access Industries, owners of Warner Music Group, invested $130 million dollars in Deezer for an undisclosed stake. This, again, is a repeat of earlier industry structures, in which each

[16] The actual equation offered by Spotify is 'Spotify's monthly revenue x (artist's Spotify streams/total Spotify streams) x approximately 70% to rights-holders'.

[17] According to Arrington, Sony owns 5.8%, Universal 4.8%, Warners, 3.8%, EMI 1.9% and Merlin 1%. Presumably, Universal assumed EMI's share when it completed its takeover in 2012. There is dispute over how much the labels actually paid for their stakes: Jerrang contends that it was just €8,800 (implying they received shares in exchange for licensing their catalogues) while Arrington disputes this, claiming inside sources state that the labels paid the same rate as other external investors and thus Jerrang's figure is missing three zeros. It is impossible to verify these figures, but it is commonly accepted that the major labels and Merlin do have a stake in Spotify.

of the majors owned their own CD distribution companies (Negus 1999, 55–60). Needless to say, the fact that the labels have a stake in Spotify has merely added to the suspicion and distrust towards the company and its royalty system. The lack of transparency in the entire system has been something that Spotify has tried to address (through its Spotify Artists portal), but they remain limited in information they can release and streaming royalty statements remain incomprehensible to even the most seasoned analysts.

From this perspective, the concerns raised by artists and independent labels about royalty payments from Spotify seem very similar to arguments made about the record industry in the past and, rather than being a 'disruptive technology' (Barr 2013), Spotify and other streaming music services may actually (or also) be quite conservative technologies. There are historical precedents here. In *Pop Song Piracy*, Barry Kernfeld argues that the history of copyright infringement in the music industry follows a repetitive pattern: new technologies or social practices emerge which undermine music rights holders' established forms of profit-making, who respond by yelling 'piracy!'. The public recognises genuinely transformative new practices from blatant copying, however, and, in such cases, rights-holders end up having to adapt to the new practices yet, in doing so, find ways of incorporating them into their existing profit-making practices (2011, 2–4).

Though the story is not complete, it is relatively easy to fit the story of digital music into such a narrative, with on-demand streaming services being the chapter in which the powerful corporations begin to incorporate the disruptive practices and reassert dominance. The recorded music landscape in the streaming era is beginning to bear many similarities to that of the CD era: financial success depends upon scale and catalogue, the major labels have a stake in music distribution networks, and the vast majority of artists do not make any money.

CHAPTER 30

DIY or Die? A Typology of DIY Careers in the Portuguese Independent Music Scenes

Ana Oliveira

DIY, Alternative Cultures & Society 1, no. 1 (2023): 20–33.
https://doi.org/10.1177/27538702231153118.

Abstract

This article addresses the DIY career building strategies in the Portuguese independent music scenes. Is it anchored on the reading of DIY careers as a pattern of promoting employability, in a context marked by major transformations in the music industries and the precarization of professional trajectories. Drawing from interviews with 71 individuals involved in the production and mediation of Portuguese independent music, we seek to understand how these actors build their DIY careers considering their different positions within the music scenes, the strategies used to negotiate their careers, and the way DIY is present. For this, we conduct a typological reading of these careers to identify different career profiles. Based on a mixed-methods approach, we identify five distinct career profiles: 'catch-all musicians', 'non-stop musicians', 'mediator musicians', 'author musicians', and 'mediators'. In their differences, these trajectories are marked by DIY ethos and praxis, from their beginnings to the present day.

DIY careers as a way of promoting employability

Over the last decades, the music industries have undergone major transformations. The proliferation of (illegal) downloading and streaming services has led to a decline in recorded music sales and contributed to the growing importance of live music (David, 2010, Haynes and Marshall, 2018; Marshall, 2015; Wilkström, 2009). It has become the main source of income for musicians and a plethora of music industries professionals. On the other hand, a series of technological innovations, the arrival of social media and the emergence of a platform economy (YouTube, Facebook, TikTok, Instagram) (Fox, 2004), have contributed to more widespread access to the means of production, distribution, and promotion of music and have created direct communication channels between musicians and their audiences (Baym, 2012; Carradini, 2016; Choi, 2016; Haynes and Marshall, 2018; Hracs, 2012; McLeod, 2005). Musicians can now easily promote their music, attracting new fans on a global scale. At the same time, these platforms offer musicians opportunities for monetization. In short, these innovations have enabled a transfer of power to the creative agents, who now have a wider margin of action at all moments of the production and distribution process and are less dependent on studios, producers, publishers, or promoters.

Although they do not provide a total democratization of cultural-creative production and distribution processes [1], these transformations have implications for musicians' working practices (Hughes *et al*., 2016). They can now take control and responsibility for a broader range of activities and tasks in the music field. To the creative dimension of writing, composing, and playing, these actors add many other activities—that of producers, editors, promoters, agents, DJs, among others. Having a music career is much more than knowing how to sing or play an instrument. It requires skills related to management (e.g. planning and strategy definition, dealing with copyright, royalties and other legal issues, stock management) and to the production of content for social media (e.g. marketing and self-promotion) (Oliveira, 2020, 2023).

The most recent analyses of these implications for musicians' ways of working are anchored on the DIY or entrepreneurial approach to music careers which has been present in research on different musical genres, in different geographical and sociocultural contexts (Bennett, 2018; Bennett and Guerra, 2019; Coulson, 2012; Gavanas & Reitsamer, 2016; Guerra, 2018; Haenfler, 2018; Kuchar, 2020; Oliveira, 2020, 2023; Reitsamer & Prokop, 2018; Scott, 2012; Tarassi, 2018; Threadgold 2018).

When it was first used in the early of the 20th century, DIY referred to the practices of creating or repairing something without recourse to an experienced craftsman/professional. Over the following decades its meaning gradually evolved to encompass a wide range of cultural and creative practices (Bennett and Guerra, 2019). From the mid-1970s, DIY gained greater prominence with the emergence of punk. By taking control of the means of production and distribution of music, several punk bands created their production platforms and, by organizing themselves into a network (Crossley, 2015), boosted the emergence of alternative distribution circuits to those that dominated the music industries. From a way

[1] Several studies (Haynes and Marshall, 2018; Kjus, 2016; Morris and Powers, 2015) show that, rather than promoting profound changes in power relations in the music industries, these transformations have been adapted to already existing practices and paradigms.

of music production symbolically and ideologically distinct from the commercial circuits, during the 1980s and 1990s, the DIY ethos remained strongly linked to the punk aesthetic. But it extended to other musical genres, other spheres of alternative cultural production, and to other socio-cultural domains. Today it is synonymous with a broader ethos of lifestyle policies, with repercussions on people's projects and professional choices, on a global scale (Bennett and Guerra, 2019).

The notion of a DIY career implies understanding it as a form of professional trajectory or a pattern of promoting employability (Guerra, 2010, 2016; Oliveira, 2020, 2023) that allows individuals to respond to the current context, guided by neoliberal configurations and by the precarization of the world of work—this obviously includes artistic and cultural work (Hesmondhalgh and Baker, 2011; McRobbie, 2016; Standing, 2011; Threadgold, 2018). In this scenario of redefining the meaning of DIY, we are now witnessing the growth of the levels of professionalization that characterize much of the contemporary DIY cultural production sphere (Bennett 2018; Haenfler, 2018; Tarassi 2018). It does not mean the DIY career concept has lost its connection to an ethos of independence and resistance. To this ethos is added the recognition of the need to achieve a sustainable lifestyle (Bennett, 2018). To discuss DIY careers is to recognize their pragmatic dimension, which justifies the existence of intersections between spheres that used to be opposed: independent and commercial, art and economy, work and leisure, ideology and pragmatism (Oliveira, 2020). It seems more appropriate to assume that DIY and contemporary independent music practices and careers coexist with mainstream ones in a continuum and a vast dynamic of intersection, generating different degrees and forms of independence.

Based on this understanding, this article aims to analyze the construction of DIY careers in the independent music scenes in Portugal[2], considering: (1) the different positions within the independent music scenes that social actors occupy, focusing on gender, education, and social class; (2) the strategies they use to negotiate a music career and their perspectives on music; and (3) the way DIY is present in their trajectories. For this purpose, and for the first time, we conduct a typological reading of these careers to identify different career profiles.

The article is structured as follows: in the first section, we make a brief historical background of independent music in Portugal and a description of Lisbon and Porto scenes. We explain the centrality of both cities and draw a portrait of their music scenes, considering aspects such as gender, education, and the socioeconomic background of their protagonists. We also describe the main strategies they use to manage their careers. Next, we present an account of our methodological approach. In the third section, we present the typology and discuss the features of the five career profiles. Finally, we provide the main conclusions.

Background

Portuguese independent music: What are we talking about?

Talking about independent music in Portugal means referring to a specific social space within the pop rock universe, established during the 1960s and 1970s thanks to the growing capacity

[2] This DIY concept is present not only in the theoretical framework that underpins this research but also in the interviewees' discourses.

of action of a diversified set of agents and structures: recording studios, labels, newspapers and music magazines, radio shows, venues, artists, and bands (Guerra, 2016). This process was marked by two crucial moments in recent Portuguese history: the democratic revolution of 25 April 1974, which ended 48 years of dictatorship, and Portugal's accession to the then-called European Economic Community in 1986. Both opened Portuguese society to external lifestyles and cultural references. This allowed the consolidation of the pop rock industry. Although on a smaller scale and with some delay in time, we witnessed similar processes to those happening in the US and the UK.

In the 2000s and 2010s, with the transformations that the music industries have experienced, with the widening of its audiences and its relative commercial success, the subfield of independent/alternative music has become a key player, recognised and, in a way, reified (Guerra, 2016), namely by gatekeepers, such as music journalists/critics and promoters. Although this sub-field claims and defines itself by opposition to the objectives and ways of working of the mainstream music industries, there are approximation movements between independent artists and bands and mainstream actors, especially multinational labels, and distributors.[3] These movements translate into contracts with major labels, which allow musicians greater or lesser freedom, depending on the type of contracts.

So, the Portuguese context meets Hesmondhalgh and Meier's (2015) argument when the authors state that indie, or independent, encompasses a diverse range of approaches to music production and promotion. This spectrum ranges from more traditionally organized independent artists and bands that resemble the majors in their way of working to DIY approaches to self-financing and self-releasing music. The analysis of Lisbon and Porto music scenes relies on this understanding of independent as a space of intersections and constant negotiations between a DIY way of doing and organizational logic common to the more mainstream spheres of the music industries.

Lisbon and Porto independent music scenes

Lisbon and Porto are the country's main cities. They are where we find the key institutions, facilities, players, and opportunities on the political, economic, social, and cultural levels. Therefore, they have always played a crucial role for the careers in the Portuguese independent music scenes. In this sense, most of our interviewees live in Lisbon (44%) or Porto (34%); the rest are based in cities close to these two urban hubs.

The importance of living in Lisbon or Porto meets the desire of 'being where the action is' (Markusen, 2006: 1929). This is related to the social and symbolic capital of both cities. As in other cultural and creative activities, the importance of the two cities comes from the fact that they host a set of venues, events, networks, relational dynamics, and key players—especially those with roles in mediation—that positively influence the building of a music career. In his analysis of Montreal, Stahl (2004) already evidenced something similar, highlighting the importance of soft and hard infrastructures[4] in sustaining the city's music scene. For these

[3] Today, the main labels in the Portuguese music field are the multinationals Universal and Sony and the Portuguese label Valentim de Carvalho, founded in 1824.

[4] Hard infrastructures include the built environment, cultural centres, meeting and socializing venues, live performance halls, studios, labels, promoters, and the music press. Soft infrastructures involve associative structures, social relations, and networks, interactions between the various members of the music scenes, which provide the flow of ideas and information.

reasons, whether in our sample or more generally in the cultural and creative sector, migration flows between smaller cities with less cultural offer and the cities of Lisbon and Porto are common. This is even more striking in the case of Lisbon. The city occupies a crucial role due to the promotional and reputation-building opportunities. Those who live and work outside Lisbon go there regularly to network.

This importance of the territorial, sociocultural, and economic contexts that structure the music scenes has been highlighted by several authors. Hracs et al. (2011) show how musicians consider the economic and social dynamics of city-regions when making their location choices. Taking the small town of Denton, in Texas, Krims (2014) also shows how urban musicians choose their location based on employment opportunities and considering the types of music consumption cities offer. Namely, the author emphasizes the relevance of the spatial and socio-cultural contexts in which musicians learn to compose and play music. These are preconditions for the development of vibrant and sustainable urban music communities. Therefore, we can say that the case of Portugal is similar to other Western countries.

In line with other music scenes and geographical contexts (Abreu et al., 2017; Berkers and Schaap, 2018; Buscatto, 2018; Gavanas and Reitsamer, 2016; Guerra, 2016; Guerra and Oliveira, 2019; Leonard, 2017; O'Sullivan, 2018; Reddington, 2012; Strong, 2011), male hegemony is a defining feature of Portuguese independent music scenes. In our sample 79% of interviewees identify themselves as men and only 21% of interviewees identify themselves as women. As other research has shown (Richards, 2016; Smith et al., 2019, Vecco et al., 2019), this makes it more difficult for women to build and maintain music careers. The women we interviewed mention aspects such as exclusion from music scenes networks; gender stereotypes of supposed female characteristics, their interests, skills, and roles assigned to them by society [5]; horizontal and vertical segregation, which relegates women to less favourable employment conditions, income, power, and recognition; difficulties in balancing professional and family life; and objectification and sexual harassment. These difficulties tend to accumulate over time, becoming a kind of 'cumulative disadvantage' (Acker, 2009 in Buscatto, 2018) that women seek to overcome to negotiate their music careers.

Despite these difficulties, in the wake of feminist-queer movements, #MeToo or the building of support networks in the music field [6], our research denotes a greater problematization of gender inequalities and the prevailing heteronormative constructions of gender and sexuality. This happens especially among the younger generations and is shown in the reduction of differences between men and women when composing lineups. Formed in Lisbon, in 2014, the collective and promoter Maternidade [7] is an example, to which we can add DAMAS, a music venue, in Lisbon. They have in common the intention of fighting the marginalization of women in concert lineups, as well as the paternalism that they consider to be institutionalized. This phenomenon also manifests itself in some musical projects, such

[5] In Portuguese society, there is a strong influence of the Roman Catholic matrix that assigns women the roles of mother, girlfriend, and wife. While men are invited to assert themselves and lead in the public space, women's domain of leadership is the private space, the home, the children, the domestic sphere.

[6] An example is shesaid.so, a global independent community of women and gender minorities in the music industries, which already has several Portuguese members. More details at https://www.shesaid.so/.

[7] More details at https://www.facebook.com/maternidade2014.

as Vaiapraia and Filipe Sambado [8]. It translates into the themes addressed in the lyrics and how the artists present themselves, questioning gender stereotypes.

In line with the results of other research on musicians' ways of working and their entrepreneurial attitude (Coulson, 2012; Scott, 2012), the protagonists of Portuguese independent music scenes have a high level of education. 69% of our interviewees have completed higher education and 20% have attended university. However, few have formal higher education in music, and this is mainly in music production and sound engineering. This does not mean a total rejection of music education: among the interviewees, 38% had taken singing and instrumental lessons; 24% had attended a music conservatory, while others had rock and jazz lessons. Nevertheless, in most cases, these lessons were a means of acquiring basic knowledge for a further DIY self-taught evolution.

As many authors (Bennett, 2018; Friedman et al., 2016; Threadgold, 2018) have shown about the importance of socioeconomic background in the creation of conditions for building DIY careers in music and others creative and cultural industries, the Portuguese independent music scenes are not an exception. Most interviewees belonged to the middle classes associated with liberal professions (66%) in artistic, intellectual, and scientific areas. We can say that this is a group of actors who are strongly qualified in educational, professional, and social terms, which contrasts with most of the Portuguese population, but is close to the reality of other artistic and creative groups in Portugal and other countries.

Although this privileged socioeconomic position, precariousness and insecurity mark the careers in Lisbon and Porto independent music scenes. This is a common feature of other creative workers (Bennett, 2018; Guerra, 2016, 2020; Hesmondhalgh and Baker, 2011; McRobbie, 2016). They must combine various strategies and sources of income. Meeting other research on music careers (Coulson, 2012; Gavanas and Reitsamer, 2016; Guerra, 2016; Reitsamer and Prokop, 2018; Scott, 2012; Tarassi, 2018), one of the main sets of strategies that our interviewees adopt takes on a logic of multiplication and can take different forms. One possibility is the development of different roles and activities in the music scenes, a multi-tasking exercise that Tarassi (2018) also identified when studying Milan's independent music scene. This is a characteristic feature of independent music production and an aspect Becker (1982) already pointed to in his analysis of the art worlds. The ability to perform different roles and activities makes artists attractive to a variety of employers and contributes to the acquisition of symbolic and cultural capital, reinforcing the positioning these actors have in the music field. A second possibility is to combine music with another profession, which may or may not be related to the artistic and cultural field. Several works in artistic and creative sectors, and more specifically in the music field (Coulson, 2012; Gavanas and Reitsamer, 2016; Guerra, 2016; Reitsamer and Prokop, 2018; Scott, 2012; Tarassi, 2018), have shown that this is an essential strategy to ensure the viability of careers in these areas. For most of our interviewees (62%), this situation arises as a necessity because the income they get from music is not enough. To teach, to be involved in several musical projects simultaneously, as well as to play, compose and write for others are other ways in which this logic of multi-tasking is translated.

[8] Further details at https://www.facebook.com/Vaiapraia and https://www.facebook.com/ofilipesambado.

A second set of strategies is strongly associated with a professional perspective of music. Musical activity is understood as any other profession. Networking, planning and defining goals, and a work methodology is a crucial strategy for a music career. This also includes the use of copyrights, as well as applications for funding. Especially networking refers to music's relational and collective dimension (Becker, 1982; Crossley, 2015). Relational networks are the main way of access job opportunities and build a reputation. Thus, they are used strategically. But they are also a way of being integrated into a community. As Coulson argues, 'networks in the music world also involve friendship, co-operation, support, musical collaboration and learning opportunities' (Coulson, 2012: 258). In the case of Lisbon and Porto scenes, our interviewees state that teamwork—do-it-together (DIT)—is a requirement for building music careers.

A third set of strategies follows a logic of continuity. Our interviewees strive to play live many times and to remain continuously active. This means always being at some point in the process of creating and distributing music, whether composing, recording, producing, editing, or playing. Regularly editing albums, singles, or video clips is also a common practice.

A fourth set of strategies is based on a logic of reduction. This can mean reducing the size of musical projects, that is, instead of having a band with several members, having a band with two or three elements, or having a solo project. But it also means saving, seeking to reduce the costs of musical activity, and adapting it to the resources available. DIY practices assume a crucial place here and in playing different roles in the spectrum of music creation and promotion.

In line with the privileged positioning of most of these actors in the Portuguese social structure, the use of family support is also a common strategy in the Portuguese independent music scenes. It is through this diversified set of strategies that the interviewees manage their careers.

Methodology

The data were collected between 2016 and 2018. To provide different points of view on the object of study and achieve a more comprehensive and robust perspective, we used a mixed-methods approach (Crossley and Edwards, 2016). We conducted 71 semi-structured interviews with individuals involved in the production and mediation of Portuguese independent music scenes: musicians, promoters, record label heads, producers, music venue programmers, managers, and journalists. We used snowball sampling, seeking to ensure that our sample was representative of the Portuguese field, namely in terms of gender. The concern to include social actors at different stages of their careers also guided sample design. We started with a set of key informants and key players in the Portuguese independent music scenes, who facilitated the entry into the field and allowed the identification of other members of the music scenes. Then, we also asked each new interviewee to suggest other people to interview.

The interviews were carried out in settings chosen by the interviewees, such as rehearsal rooms, recording studios, bars, music venues and public places. All interviews were audio-recorded and fully transcribed. We conducted our data analysis by building key categories based on the interview scripts. The interviews were subjected to a thematic content analysis using *NVivo*, which also served as a starting point for the construction of the typology. For

this construction, we used multiple correspondence analysis (MCA), a technique that allows knowing the topological configuration of the social space under analysis, facilitating the definition of profiles of individuals characterized by a set of variables that represent the most frequent type- relationships. We complemented the MCA with cluster analysis, a clustering method that allows the operationalization of the groups/profiles identified through the MCA. Throughout the article we will use excerpts from the interviews as a way of illustrating the ideas discussed. To ensure their privacy, interviewees have been anonymized.

A typology of Portuguese DIY independent music careers

To better understand the construction of DIY music careers, we conducted a typological reading of them to identify different career profiles. To define the career profiles, we considered two analytical dimensions that the MCA revealed to be the most relevant. The first involves the strategies adopted by social actors to ensure the sustainability and economic viability of their careers, including strategies such as networking, the capacity for reinvention, regularly publishing albums and other artistic materials, or using copyrights. The second one focuses on the combination of music-related activities with others in non-musical/artistic fields to earn a living. Based on these dimensions, we were able to identify five ideal-typical career profiles in the independent music scenes: 'catch-all musicians', 'non-stop musicians', 'mediator musicians', 'author musicians', and 'mediators'. They are fluid ideal types. Overlaps or transitions between different career profiles are common during these actors' trajectories. These movements are a consequence of the precariousness and uncertainty that characterise the careers of these actors. They are also the result of external factors, such as the fragile economic situation of the country and the effects of the COVID-19 pandemic.

Catch-all musicians

'Catch-all musicians' comprises 27% of our interviewees. This career profile includes musicians who mostly combine their music careers with other music-related activities, such as writing and playing for others and working as producers and composers for cinema, television and advertising. It is also common to find musicians who combine music with another profession outside the musical/artistic field. Although the interviewees perceive music in a professional way, their own music-making is not their primary source of income. It is also in this career profile that applications for funding are more frequent, which is a crucial task in the context of the non-artistic activities developed by musicians. Therefore, the careers of these musicians require a great capacity for adaptation and enormous versatility. This is the reason why we have designated this career profile as the 'catch-all musicians'. This capacity for adaptation and multiplication of projects and roles is their main strategy to deal with the instability and uncertainty of a music career. This occurs in a markedly DIY way. The skills and expertise needed to perform the various roles are acquired in a self-taught way, in a logic of sharing and collaboration with others. It is also a career profile deeply marked by DIT, because it is anchored in relational networks. The following excerpt illustrates the need to combine several activities, play with different bands, and work hard. In these words, are also evident the difficulties that this multi-tasking entails:

> I live from the music field, not only making music and not only making the music I want. I make music for advertising, for films. I also have work in producing events, and in the studio. I must keep splitting up, which brings very good things. For example, being able to do anything. Then there's a downside: you can never dedicate yourself 100% to anything. And it's very hard to stop doing one of them because it's the combination of them all that allows you to continue living.
>
> Male, 40 years old, BA, musician, producer, promoter and record label head, Barreiro.

This career profile has the most significant gender difference: 94.7% of the individuals in this sample are male. This group is also where we find the oldest interviewees, that is, over 50 years old. Therefore, it is also in this profile that we find the interviewees with the longest career: 89.5% of the interviewees have 16 or more years of activity. This finding reinforces an idea that other studies (Abreu et al., 2017; Bennett, 2013; Haenfler, 2018) have already demonstrated: the participation and involvement in music scenes and subcultural movements is not a reality that remains confined to youth. It continues over time, even though the forms of involvement may change. At the same time, it leads us to consider that this versatility and capacity for adaptation is essential for maintaining and consolidating a music career over time.

Non-stop musicians

This career profile includes 10% of interviewees. Finding a balance between music-making and other professional activities is also a reality, but the connection between the day job and the artistic sphere is more evident in this career profile. The defining feature is the maintenance of continuous musical activity. This means ensuring that the cycle of creation-performance-dissemination is never interrupted, requiring regular releases of albums, EPs, singles and videos. To ensure this, the musicians must plan the whole creative process and define objectives and a work methodology. These musicians are also able to reinvent themselves as musicians and artists. One way to achieve this is to develop various musical projects in parallel. This not only enables musicians to express their creativity in different musical styles but also increases the possibilities of playing live and their sources of income. In this way, and as the excerpt below illustrates, one of the main strategies used by these musicians is to ensure as extensive a concert circuit as possible for their different musical projects.

> We must be always doing something, trying to give many concerts. We mustn't stand still. Nowadays, music gives us money through concerts, royalties, and almost nothing else. The goal is to keep playing, to do new things so we can play more often.
>
> Female, 31 years old, attended higher education, musician, dance teacher and actress, Porto.

This implies the development of solid relational networks with other actors of the music field. Networking not only leads to job opportunities but is also essential in the processes of reputation building and the achievement of a more favourable positioning in the field. In this career profile, music takes on a professional character, requiring planning, dedication to work, perseverance, and the capacity to multiply roles in the music scene. It is in this and the previous category that a highly professional perception of music-making prevails, and DIY practices take on a more professional dimension. This brings us back to the works of Thornton (1995), when she introduces the notion of 'subcultural capital', and Haenfler (2018) who shows how DIY practices and subcultural experiences are transformed into viable career

paths by encouraging the development of skills useful in the labour market, such as management, organisational and marketing skills, but also DIY skills, of resistance, achievement, freedom, and collective action.

Mediator musicians

This is the career profile that brings together the highest percentage of interviewees (31%). Unlike the previous career profiles, for 'mediator musicians', the combination of music-making with other professions outside the music field is not very common. However, the need to play several roles is also a reality. As well as being musicians, these actors work as promoters, record label heads, managers, or music venue curators—that is, professions that allow for creativity, but focused on 'mediation' activities. DIY ethos and practices are very present. First, because the performance of these roles arises, in most cases, as a necessity, due to the lack of channels for promoting their musical work. At the same time, the learning of the necessary skills for the performance of these activities takes place in a self-taught way. In contrast to the other career profiles, the development of several musical projects is not an option. The focus is on the multiplication of roles. The musicians in this career profile tend to be younger and, therefore, recourse to family support is more common for these actors than for the other categories. Another differentiating element is the fact that most members understand music as being only one of the channels and possible languages to share their vision of the world. As the following excerpt clearly demonstrates, we find in these actors a willingness to experiment artistic languages besides music:

> I can't imagine doing this my whole life. I want to realize if I want to continue making music or if it's just a means. I think for me, it's just a means. It could be writing or making films, or theatre. I like the boost it gives me. Many things I'm learning by making music and programming will serve me in the future. But I don't see myself making music for the rest of my life. But maybe I'll do something else related to music, programming, and agency work.
>
> Female, 18 years old, attending higher education, musician, promoter, and record label head, Lisbon.

We also find a skeptical perspective regarding living solely as musicians. They consider that being a full-time musician, especially in the independent music scenes, is virtually impossible. So, in the future they imagine themselves combining music with other artistic activities, such as illustration or writing, as well as playing other roles in the independent music scenes, more linked to mediation and not so much to creation. Involvement in the music field tends to be seen as a form of experimentation and learning. And rather than something continuous and linear, it seems to be made of back-and-forth movements. It is also important to mention that it is in this career profile that we find a higher presence of women (32%), as well as greater awareness and problematization of gender differences in the music field and other artistic areas (Buscatto, 2018; Reddington, 2012).

Author musicians

The fourth career profile, which we have designated as 'author musicians', is the smallest (7%). The small size of this group is a significant and quite expressive result of the difficulties involved in building and maintaining careers in independent music scenes. This is the only career profile whose members live exclusively from the music they create for themselves.

They do not need to create music for other people or be involved in mediating activities. This implies a diversified set of strategies. First, recognizing that networking and the acquisition of social capital are crucial (Becker, 1982; Guerra, 2016; Reitsamer and Prokop, 2018), these interviewees focus intensively on networking and establish relationships in the music field. However, like the 'mediator musicians', the reduction of the size of musical projects (solo projects or projects with two or three people) was also a career-management option. It makes easier and cheaper to book bands and allowing salaries to be divided among fewer people. In line with data revealed by other investigations (Banks and Hesmondhalgh, 2009; McRobbie, 2016), this aspect reveals the influence and impact of neoliberal ideals and their logic of individualization on musicians' trajectories, potentially generating feelings of isolation. Another strategy often used by these actors is the planning and definition of a work methodology, as well as the maintenance of continuous musical activity and the realization of a concert circuit. A differentiating element of this career profile, which clearly reveals an authorial vision of the artistic work, is the use of copyrights [9], which enable them to generate income from their music, often an essential supplement in periods when income from other sources is scarce. The words of one of the interviewees show that a music career requires knowledge about these mechanisms:

> You must understand a minimum of collective management of copyrights: know what that is and how you can get the money that is yours. You must know how you can make your music profitable without selling records or concerts (publishing, placement,…). These are important sources of income. You must know how copyright works and what happens if your music is used without your permission.
>
> Male, 27 years old, BA, musician, Porto.

For most of these interviewees, music has a professional dimension. Consequently, and like the 'non-stop musicians', these actors manage the uncertainties associated with a professional trajectory in music through planning and dedication to work and the adoption of a perseverant posture. The trajectories of these actors are also marked by DIY, which translates into their desire to control the different phases of the processes of music creation, production, and dissemination. It is in this career profile where we find the actors with a more privileged family background in socioeconomic terms. If we consider that this is the only career profile in which musicians manage to live from the music they create for themselves, this seems to suggest that the safety net provided by a middle or upper-class origin acts as a crucial element in enhancing the maintenance of the musical careers of these actors, as is also evidenced by other authors (Bennett, 2018; Threadgold, 2018).

Mediators

We come to the last career profile, the mediators, which includes an extensive set of interviewees—25%. This is a heterogeneous group that is distinct from the others because it does not include musicians. These are social actors who play crucial roles in the Portuguese independent music scenes, acting as journalists/ music critics, radio broadcasters, promoters, managers, label heads and music venue owners and/or programmers. Because almost all live exclusively from their activity in the music field, they have a professional perception of music. The only exception is one person in charge of a record label, who has another job, his main

[9] Musicians in other career profiles also use copyrights, but this is less significant for them.

source of income. In this case, even if the publishing activity requires him to work a lot of time, it is a hobby, reflecting a strong passion for music. In all the other cases, the economic sustainability of their careers is entirely anchored in the musical sphere, often combining editorial activity with promotion or management. The professional trajectories in this career profile are also developed on a DIY basis. Except for the journalists, who mostly had higher professional education, in the other cases, learning was based on trial-and-error as their involvement in music grew. After the 'mediator musicians', this is the career profile where we find more women (24%), which suggests that a music career for women continues to pass essentially through the sphere of mediation. The following excerpt illustrates the trajectory of a woman, highlighting DIY as a way of learning the role played in the music scene. It also shows that over the years, the music stopped being a hobby and became her main occupation:

> I went to London to do my degree (engineering). I worked in this area, but from the beginning, I had a very close relationship with music. I saw a lot of concerts, I socialized a lot with people. The music industries fascinated me. One day I decided to start a record label with a friend. Later, a job offer came up in Portugal, which had nothing to do with music, and I accepted it. I worked as a management consultant, but soon I started working with bands again. After some time, I created an agency, left my other job, and began to dedicate myself 100% to music.
>
> Female, 40 years old, BA, entrepreneur in charge of a music agency, Lisbon.

In another dimension of this research, which is not the focus of this article, we applied Social Network Analysis to understand the structure of the relational networks that sustain the two music scenes, and we perceived the centrality of the people who belong to this career profile. They are catalyst figures who support and assure the maintenance of the scenes, acting as an important link in the cooperative network that Becker (1982) showed to be a feature of the art worlds.

Conclusion

Through a pioneering analysis in Portugal, this article augments the literature on the ways of working and the configurations DIY careers assume in independent music scenes. Based on a mixed-methods approach, it identifies the strategies and modes of action as well as the difficulties and tensions involved in these trajectories. It brings major contributions to the ongoing international discussion on DIY music practices and careers. The first is that it is the accumulation of roles that allows a wider range of interviewees to earn a living from music, albeit not always exclusively from their activity as musicians. Far from being a homogeneous and linear experience, having a career in the Portuguese independent music scenes is a multifaceted and complex process, where different possibilities and modalities of trajectories fit, as reflected in the diversity of the five career profiles of the typology we have identified.

This multiplicity and the non-linear character of these trajectories are intensified with situations such as the one experienced with the COVID-19 pandemic. In Portugal, it deepened and made more visible fragilities that had already been felt by cultural workers for a long time. This was felt particularly in the performing arts. The lockdowns have meant sharp income losses for musicians and other actors in the live music ecosystem. Support measures from the Portuguese government were scarce and did not always reach all actors involved in the

independent music scenes, which tend to benefit from less support when compared to other music genres. As a result, the combination of music with other professions became even more necessary for many of the protagonists of Lisbon and Porto's independent scenes. These actors had to reinvent themselves in the search for new strategies to deal with the challenges imposed by the pandemic. And in this process, digital tools and platforms have assumed a crucial place in music production and promotion (Green et al., 2023).

A second contribution is that, although a music career is associated with a wide diversity of possible strategies and trajectories, there is one common denominator: the DIY ethos and practices. It is a requirement for a career in the independent music scene. DIY practices were important to most actors from the beginning of their cultural activities to the present day. They manifested in different learnings such as singing and playing instruments; recording, producing, booking, and organizing concerts and tours; or producing contents for social media. In all these learning axes, we speak of informal learning processes and contexts characterized by trial-and-error and the sharing of information and skills based on belonging to creative-artistic communities and local music scenes (DIT), facilitated by digital technologies. Discursively, DIY does not fail to appear connoted with the will to affirm an alternative positioning to the dominant paradigms and ways of making, assuming an ideological character and one of resistance. But what prevails above all is its imminently pragmatic character. DIY appears as a necessity and as a strategy for survival in music.

Third, although there is greater awareness and more efforts to make music scenes truly equal spaces for men, women and gender minorities, women continue to develop careers mainly as 'mediators' and 'mediator musicians'. Music genres such as punk and independent/alternative music are associated with more inclusive attitudes and contexts and a disruptive posture towards the current system and its configurations. However, our research adds to the theoretical and empirical body that demonstrates that the 'cumulative disadvantage' (Acker, 2009 in Buscatto, 2018) that women face when trying to build their trajectories continues to be a reality in Portuguese independent music scenes.

The last implication of this study is to show that the family socioeconomic background and the social class of these actors continue to play a crucial role as an element that enhances the pursuit of musical careers. This is an argument that our typology proves, and it is especially evident in the 'author musicians' career profile. It is the only one in which musicians live exclusively from the music they create for themselves. It is also the one in which its members have a more privileged socioeconomic family background. If, when applied to music and music careers, DIY ethos and praxis might suggest that these careers, and their viability and sustainability, could become accessible to a broader set of social actors, our research shows that they are not a sufficient condition for this.

CHAPTER 31

The Political Economy of Financially Successful Independent Hip-Hop Artists

Geoff Ostrove

Class, Race and Corporate Power 2, no. 1 (2014).

Abstract

From 2000 to 2010, America's music industry's annual revenue went from $4 billion to $2 billion. Much of this is attributed to the internet's ability to provide consumers with easy access to free music, and hip hop has been especially impacted by this trend. Utilizing document analysis and personal interviews, this study found that the success of independent artists has influenced the business strategies of major record companies. In response to a dramatic decrease in record sales, major labels have made more of an effort to sign their artists to 360 deals, which allow the labels to profit from every aspect of an artist's brand or identity. While some independent artists are the main beneficiary of the profits generated from their music and personal brand, they also reify the commodity-form capitalist system by attempting to turn their music and brand into a fetishized commodity and by turning their audience into a fetishized commodity.

Introduction

The internet has become the world's greatest tool for consumption. Many acts of consumption that previously occurred in a physical, face-to-face, human-to-human setting now take place within the internet's digital hyperreality. In response, the music industry must adjust its business strategies to keep up with an increasingly digital world and consumer behavior. This study explores the ways in which financially successful independent hip hop artists are able to maintain consistent income, and in what ways their business strategies have influenced the actions of major record labels.

Traditionally, most artists would need to receive cash advances from major record labels in order to be able to fund the recording and production of their music. After receiving the cash advance, however, the artist would no longer control the music. The label that issued the cash advance would then sell the artist's sound recordings and be the main financial beneficiary. Known as working "for hire," this was the traditional way in which artists were able to make a living and record companies were able to turn a profit.

Nowadays, instead of simply making money by selling an artist's music, record companies demand to control more than just the sound recordings. Most major labels now control all of the image and branding rights associated with the artist, which includes merchandising, sponsorships, and touring. Known as "expanded-rights deals," this is an emerging way in which recording artists are able to make a living and record companies are able to turn a profit.

Because of the internet, however, musicians who previously needed the capital and resources of major record labels can now create, record, produce, and distribute music completely independently. The internet has created easy access to resources that were not previously available to independent artists. On the other hand, the internet has also increased the ability of consumers to easily access free music. There are now many ways for consumers to listen and possess music without actually purchasing it. On top of the rising rates of illegal music piracy, there are now a growing number of legal internet sites that allow consumers to listen to music for free, such as Pandora, Groove Shark, YouTube, MySpace, and many others.

The aim of this project is to explore the strategies utilized by financially successful independent hip-hop artists in order to maintain consistent income in an age when consumers do not necessarily need to purchase music in order to listen and possess it. Specifically, this project explores how independent hip-hop artists make the majority of their money (whether it be by selling records, performing at live events, selling merchandise, etc.), and whether independent hip-hop artists are the ones taking home the majority of the money made from their art. In other words, while the "expanded-rights deal" model allows for the record company to be the main financial beneficiary of an artist's work, do independent artists break away from this paradigm by receiving the majority of the profits?

In addition, this paper explores whether or not major record labels have been impacted by the success of independent artists. With the decreasing need to turn to major record labels in order to record, produce, and distribute music, how have major record labels changed their business strategies in order to keep up with the cultural and societal changes that have resulted from technological advancements? How much do record labels still rely on record sales as a major source of revenue?

In other words, this paper answers three main research questions:

1. How do financially successful independent hip-hop artists generate the majority of their income?
2. How have major record labels adjusted their business strategies as a result of the financial success of these independent hip-hop artists?
3. Are these independent hip-hop artists the main beneficiaries of the revenues generated from their labor?

The Political Economy of Communication

Political economists of communication have sought to decenter the media of communication by investigating its economic, political, and other material constituents. At the heart of political economy is the notion of "viewing systems of communication as integral to fundamental economic, political, social, and cultural processes in society."[1] This includes considering those people who set the parameters and goals for media and information production and distribution, and for the introduction and developments of new communications and information technologies. In other words, political economists of communication analyze how power and control is produced and reproduced within the media industry.

Power and control is central to any understanding of modern society and "any adequate analysis of the distribution of power and of the process of legitimation must necessarily include an analysis of the mass media."[2] Political economists understand that power is located at different levels. It can be held within specific ownership structures, hierarchies and political alliances with media corporations, and, also, in access and reception.

Understanding the role of commodities is also central to the political economy of communication. Karl Marx noted that the value of a commodity reflects the value of the labor that has gone into producing it; but Dallas Smythe felt that when it came to communications, Marxist theory had a blind spot.[3] His question to Marx was: What is the commodity form of mass-produced, advertiser supported communications under monopoly capitalism? And his answer: audiences. In other words, Smythe realized that the mass media had turned the audience into a commodity. In fact, what many people would consider "leisure time" is really just the time when the audience is being sold to advertisers. This means the audience is really doing unpaid work. Therefore, the selling of audiences to advertisers not only serves as an essential marketing function, it also helps to reproduce labor power within society. It is not just "a question of the increasing control of the large media companies over a particular media sector or even several sectors, but also their increasing influence over the whole field of non-work time."[4]

This relates to the mode of production. The mode of production is "the way in which a society chooses to appropriate and allocate all of the productive resources and surpluses needed for and created by the process of production," and "capitalists create rules defending

[1] Vincent Mosco. *The Political Economy of Communication*. Sage, 2009, 66.

[3] Dallas Smythe. "Communications: Blindspot of Western Marxism." *Canadian Journal of Political and Society Theory*, 3, 1977, 1–28.

[4] Ibid.

unequal distribution determined by competition between capitalists and each individual's willingness to pay for goods and services."[5] In regards to commodification, the capitalist mode of production helps to separate conception from execution within the media industry. For instance, it is not uncommon for a commodity to begin within working-class culture, and then be transformed into a product and offered back to working class audiences.

Markets play a big part in political economy, as well. Meehan and Torre point out that in the media industry these "markets tend to be oligopolized and stratified, with the proverbial 'big boys' exerting the most influence over the market's shape and workings."[6] Therefore, the organizational structure of the economy, not the particular market, is the major force guiding production, distribution, and exchange of goods and services.

In the media industry, five major corporations basically run the show: The Walt Disney Company, News Corporation, Time Warner, CBS Corporation and Viacom. The myth is that they compete against each other. The truth is that the intertwining of these big corporations through joint ventures gives each participant an interest in the success of the specific venture but also an active concern for the health of its partner.

These corporations also integrate their products across different markets to increase profitability. Vertical integration involves the same company owning different aspects of the same product line, like a car manufacturer also owning a tire company or a record label owning a CD manufacturer. Horizontal integration involves moving to markets similar to one's original product.

For example, Warner Bros. was involved in distributing *Krush Groove*, a film released in 1985 that chronicles the success of Def Jam. For Def Jam, though, *Krush Groove* was more than a film. *Krush Groove* was an opportunity to showcase Def Jam's rising stars, help these young stars make some money, and advertise the label all at the same time. Def Jam artists, such as LL Cool J, the Beastie Boys, The Fat Boys, Kurtis Blow, and Run-DMC, made appearances in the film and contributed to the soundtrack. The film itself, which grossed $3 million in its first weekend, highlights the path that Russell Simmons and Rick Rubin took to make Def Jam one of the first successful independent hip-hop labels. *Krush Groove* serves as an important artifact in the history of hip-hop culture, as well as an excellent example of synergy.

The Fetishism of Commodities

Marx's *Capital: A Critique of Political Economy* begins with an analysis of the basic component of the capitalist economy: the commodity. From this he explains how many of the contradictions within a capitalist society arise. In the case of commodity-form capitalism, the intrinsic quality of something no longer determines its value, only its base of exchange.

The nature of commodities, though, does not arise from the fact that people produce them. People in all societies produce useful goods, but not all these goods are commodities. A good becomes a commodity when the good becomes fetishized. Traditionally, the term "fetish" refers to the religious practice of attributing human characteristics to material objects. In

[5] Dean Colby. "New Media as a New Mode of Production?" In McKercher (Ed.), *Knowledge Workers in the Information Society*. 1997, 193.

[6] Eileen Meehan. "Markets in Theory and Markets in Television. In Wasko, Murdock, and Sousa (Eds.), *The Handbook of Political Economy of Communication*. Blackwell Publishing, 2001, 68.

the general sense, though, the concept of "fetishism" refers to people finding more value in a good other than just simply its physical production value.

In the music industry, the concept of "hype" is very similar to the notion of fetishism. Hype should be understood in three distinct ways: 1) as a result of material changes in the music industry over a period of time; 2) as a multifaceted discursive process that involves the creation, circulation, and debate of journalistic writing; and 3) as a rhetorical strategy employed by music artists to distance themselves from the aforementioned process.[7] In other words, financially successful musicians must create hype for themselves in the very same way that a commodity must be fetishized.

Sarah Thornton studied how self-conscious subcultures that are brought together by a particular niche media (such as music) can sometimes be recast as "movements" within popular cultures. In her analysis, she coined the notion of "subcultural capital" to refer to the distinctions made by subcultures to remain unique from "mainstream" society. This subcultural capital, however, can sometimes be used by mainstream society to generate financial wealth.[8]

Some scholars have pointed to the usefulness of the term "scenes" for describing this phenomenon, noting that the "sense of purpose articulated within a musical community normally depends on an affective link between two terms: contemporary musical practices, on the one hand, and the musical heritage which is seen to render this contemporary activity appropriate to a given context, on the other."[9] In other words, in a musical scene or subculture, there is a relationship between particular musical practices and a particular geographic space at a particular moment in time.

Other scholars highlight the notion of the "brand community" to refer to cultures such as hip hop. They define a brand community as a specialized, non-geographically bound community, based on a structured set of social relationships among admirers of a brand. Like other communities, it is marked by a shared consciousness, rituals and traditions, and a sense of moral responsibility. In short, subcultural branding is an important concept for understanding the evolution of hip hop culture. Because of its international success, however, hip hop can no longer be considered a subculture.

Instead, hip hop should be seen as a major part of contemporary mainstream popular culture. For example, Coca-Cola specifically targets hip-hop culture in their marketing campaigns. Sprite, a soft drink produced by Coca-Cola, since its inception, has always included hip hop in its marketing strategies. Sprite has recently even teamed up with the National Basketball Association (NBA) in a campaign that commoditizes rap music and other aspects of the hip-hop culture.

To Coca-Cola, Sprite's "Obey Your Thirst" slogan sends a clear message to corporate America about the financial viability of hip hop: "It's okay to work with this culture, Proctor & Gamble. It's okay, Ford Motor Company. It's okay, IBM. Because this great American brand aligned itself with hip-hop. And it's beating everybody."[10]

Procedures for Conducting this Study

In his preface to *Capital: A Critique of Political Economy*, Marx outlines political economy's method of analysis. To Marx, the purpose of political economy is to analyze the capitalist economy, not as the sum of individual acts of exchange, but as a complex system, dominated by laws of its own which are as powerful as the laws of nature.

Document analysis is a major methodological component of political economy. In fact, documentary investigation was the main research tool of many classical sociologists. For example, "Marx made extensive use of the reports of the factory inspectors, Weber utilized religious tracts and pamphlets, and Durkheim employed official statistics on suicide." [11]

One of the most important and widely read early research on power was *Who Rules America?*, which was originally written by G. William Domhoff in 1967. Domhoff suggests that the best strategy in conducting power structure research is to first create a network analysis. A network analysis traces all the people and organizations that make up the power structure, and then it figures out how they connect to and influence government. This is achieved by analyzing annual financial reports and studying the people who sit on boards of directors or serve as high-ranking executives. Then, Domhoff suggests conducting a content analysis, which is the term for the systematic study of the power structure's ideologies, policies, and plans, which are learned about through the careful study of documents such as the texts for speeches, policy statements by organizations, and drafts of legislation. [12]

Although classical sociologists utilized document analysis as a main research tool, they also recognized other qualitative methods as useful tools for analyzing society. Geertz once said that he agreed "with Max Weber, that man is an animal suspended in webs of significance he himself has spun. I take culture to be those webs, and the analysis of it to be therefore not an experimental science in search of law but an interpretive one in search of meaning." [13]

Participant observation is a useful method because it allows a phenomenon to be perceived from a normal everyday setting. This method of analysis is great for researchers who are analyzing live events (such as concerts) and other phenomena that take place in an open and public setting. This method allows the researcher to observe a phenomenon without dramatically affecting it.

Using a mix of methods within a research project allows for a greater level of comparison and accuracy. This study utilizes political economic methods like document analysis, as well as qualitative methods such as personal interviews, e-mailed questionnaires, and participant observation.

To conduct this study, the researcher began by analyzing important financial documents pertaining to the Big 4 record companies. These documents included corporate financial reports, transcripts of legislative hearings, and court records. The researcher also interviewed individuals who have experience working within the music industry. Rappers, DJs, promoters, publicists, managers, and executives were all interviewed. A full list of the individuals interviewed can be found in the appendix.

[12] William Domhoff. "Who Rules America?" http://sociology.ucsc.edu/whorulesamerica/.2006.

[13] Clifford Geertz. *The Interpretation of Cultures*. 1973, 5.

Potential interview participants were contacted via email. Some interviews were conducted in person, some interviews were conducted on the phone, and some interviewees simply answered a questionnaire and emailed it back to the researcher. The researcher also attended live music events where the interviewees were performing in order to observe the experience of being a successful independent hip-hop artists and to analyze the behaviors of consumers attending the concerts and purchasing merchandise.

Political economists are not content merely to criticize the system. Instead they take up the tools of empirical social science and use them to document the domination of big corporations and the upper class over American political life and to analyze the mechanisms by which that domination is maintained. By analyzing documents and incorporating the notion of praxis into its ideology, political economy analyzes how power is produced and reproduced within specific markets and industries, and reveals where and how active resistance is possible.

The purpose of the following section is to highlight trends within the mainstream music industry and to gain an understanding of how financially successful independent hip hop artists are influencing the business strategies of major record labels. This section also reveals the ways in which major record labels are currently able to profit from the success of independent artists.

The Big 4, the RIAA, and the Rise of Expanded-Rights Deals

As internet use has risen in the 21st century, so has the rates of music piracy. Major record companies, as well as the federal government, have struggled to figure out how to handle this trend. On July 19, 2000, the Congressional Committee on International Relations held a House hearing entitled, "Costs of Internet Piracy for the Music and Software Industries." This meeting was held by the Subcommittee on International Economic Policy and Trade in order to discuss the rising rates of internet piracy and how specific industries, such as the music and computer software, were being dramatically affected by this new trend. The hearing referenced research from the International Intellectual Property Alliance, which estimated the total losses attributed to these so-called content industries to be over $8.5 billion in 1999. [14]

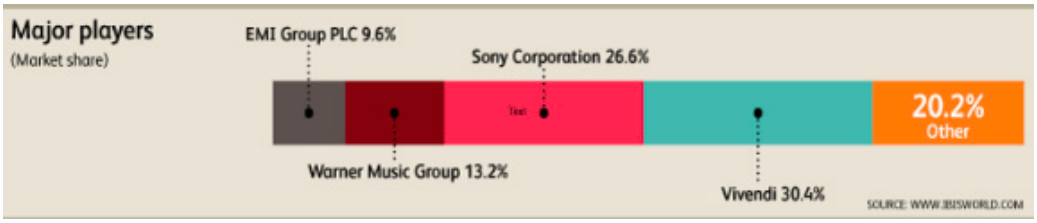
Ileana Ros-Lehtinen, a Representative from Florida and the head of this Subcommittee, suggested that the music industry itself might be to blame for this trend. She argued:

> It has been estimated that a compact disk costs as little as 60 cents to manufacture, and depending on where you live, a new CD will cost you around $15. When CDs were first introduced in the early 1980s, manufacturing costs represented $3 to $5 per CD and retailed for $15 to $20. As the manufacturing price per CD has fallen, there has not been a parallel drop in the retail price. When compared to the prices offered for music and software by Internet counterfeiters, there can be little doubt as to why many ordinarily law abiding citizens are swayed into breaking the law. This is not an excuse or a justification for on-line piracy, but merely one example of the need to look at all sides when approaching a problem as insidious as piracy. [15]

[14] US Congress. House Hearing 106–174: Costs of Internet Piracy for the Music and Software Industries. Subcommittee on International Economic Policy and Trade. Washington, DC: US Government Printing Office. (2000, July 9).

[15] Ibid

Ros-Lehtinen's sympathy towards those who pirate music, though, was not shared by her congressional colleagues. This House hearing represents a major turning point in the way in which the United States government responded to music piracy. From that point on, the government made efforts to make it harder for consumers to have free access to music.



Much of this effort has been inspired by the effective lobbying strategies of the Recording Industry Association of America (RIAA), which according to its own website is:

> …the trade organization that supports and promotes the creative and financial vitality of the major music companies. Its members are the music labels that comprise the most vibrant record industry in the world. RIAA members create, manufacture and/or distribute approximately 85% of all legitimate recorded music produced and sold in the United States. In support of this mission, the RIAA works to protect the intellectual property and First Amendment rights of artists and music labels; conduct consumer, industry and technical research; and monitor and review state and federal laws, regulations and policies. [16]

In other words, the RIAA is an organization that consists of most of the major record labels in America. Its main focus is to preserve the financial productivity of the music record industry by influencing policies and legislation at a federal level. Based on a study conducted by the Institute for Policy Innovation, the RIAA claims that music piracy results in more than 70,000 lost jobs and $2 billion in lost wages to American workers every single year. [17]

Universal Music Group (Vivendi), Sony Music Entertainment, EMI Group, and Warner Music Group were known as the "Big 4" in the music industry. These companies, along with their many subsidiaries, accounted for almost 80% of the revenue generated within the music industry in 2011. [18] 2011 total market share can be seen below:

Figure 1. 2011 Music Industry Market Share

(IBIS World 2012)

Between 2000 and 2008, the RIAA brought lawsuits to over 35,000 people for music piracy. The RIAA credited the lawsuit campaign with raising awareness of piracy and keeping the number of illegal file-sharers in check while the legal market for digital music took off. However, the RIAA's decision to stop pursuing legal action against those pirating music coincided with an important shift in the music industry.

2008 was the first year that a record label reported that digital sales made up the majority of its revenue. Atlantic Records, a subsidiary of Warner Music Group, reported that digital

[16] RIAA (2012). riaa.com

[17] Ibid

[18] IBIS World. 2012. Clients. IBISworld.com.

sales represented 51% of its fourth quarter revenue that year. This moment represents a shifting trend in the music industry.

Because of contemporary changes in technology, musicians now realize they can record, produce, and distribute their music independently. This also means they can receive the majority of the revenue generated from their music. Therefore, fewer artists need to sign record contracts.

In response, major record labels began to focus more on finding artists who would be interested in signing an "expanded-rights deal," a strategy pioneered by Warner Music Group. The results of this effort are obvious when analyzing Warner Music Group's annual reports. In 2008, Warner Music Group had almost one-third of its artists signed to expanded-right deals. That same year, at the Web 2.0 Summit, WMG CEO Edgar Bronfman told the audience that his label now requires all new artists to sign 360-deals. By 2010, over half of Warner Music Group's artists were signed to expanded-rights deals.

Major record companies, like Warner, have become determined to sign their artists to expanded-rights deals because, despite the fact that digital sales are now greater than physical music sales, digital sales do not generate as much income. Therefore, profits must be made through live events and merchandise. Expanded-rights deals allow record labels to potentially profit without having to focus on album sales as the main source of revenue. Digital album distribution, however, has the potential to generate higher profits than physical sales because the production and distribution costs of physical albums are much higher than digital production and distribution.

For example, in November of 2011, Pittsburgh-based rapper Mac Miller's *Blue Slide Park* debuted at No. 1 on the Billboard 200 chart, selling 144,487 copies according to Nielsen SoundScan. This marks the first time that an independently released debut album hit No.1 on the charts since Tha Dogg Pound's *Dogg Food* was released in 1995. In fact, SoundScan shows that 76% of his total 144,487 sales came through online retailers. [19]

Mac Miller's success, however, did not come over night. Between 2007 and 2010, he released four EPs for free online. He also toured constantly. So, by the time he released his first LP in 2011, he had generated a tremendous amount of publicity for his music and for his personal brand. When *Blue Side Park* debuted on the album sales charts at number one, it was a watershed moment for his Pittsburgh-based record label, Rostrum; his San Francisco-based digital distribution and marketing partner, Ingrooves; and his physical distribution partner, Fontana, which is the independent artists' sales and marketing division of Universal Music Group.

"This is a big moment for the independent music community," said Dave Zierler, EVP & General Manager of Ingrooves. "Rostrum and Mac are proof that a digitally-focused independent effort works in today's dynamic music marketplace, by engaging fans directly and maximizing availability to all consumers via our global online retail network." [20]

With more than a million Twitter followers, and videos on YouTube approaching a total of nearly 100 million views, Rostrum Records helped Mac build a huge fan base online, which made a digital partnership with Ingrooves even more logical. Mac Miller's use of the internet to promote his music and his personal brand is a major component of his financial success

[19] Ingrooves. 2012. http://www.ingrooves.com/blog/?p=4953.

[20] Ibid

as an independent artist. This is evident when considering that over 76% of his album sales were digitally distributed. [21]

Increasing use of internet technology is substantially affecting the industry's revenue earning capability, as freely available music online (whether legally or not) is devaluing the rights held to music by publishing companies and record labels. As more and more countries establish intellectual property rights protections and crackdown on websites that allow illegal file sharing, record labels' profits from international sales improve. For example, Sweden strengthened the legal rights of music labels in 2009 and, according to the International Federation of the Phonographic Industry (IFPI), music revenues were up 10% overall, driven by a 98.6% increase in digital sales. [22]

This has not been the trend in most of the world, however. EMI Group, a UK-based music company, has, like its competitors, experienced difficulties as a result of the changing music and media environment. Although it still is the fourth largest record company in the world, the company's total revenue has fallen at an average rate of 6.1% per year over the five years to 2011. [23]

Music publishing revenue has risen at an estimated rate of 2.4% per year, as EMI managed to derive considerable revenue from existing licensing agreements, whereas revenue in music production and sales requires new music to be produced and purchased, and this is where the industry is experiencing difficulties. Over the past three years, licensing and publishing has gone from representing less than 20% of revenue to more than 30%, a clear indication of the state of the industry at large. [24]

EMI's success in the publishing sector, however, was not enough to save the struggling label from needing to sell off many of its assets to the other three major record companies. In February of 2011, Citigroup took a big step toward exiting from its disastrous involvement in EMI when it assumed control of the major from British private-equity firm Terra Firma, paving the way for EMI's sale. The auction of EMI eventually culminated in November of 2011 with a Sony-led consortium agreeing to buy EMI Music Publishing and Universal Music Group signing a definitive agreement to buy EMI's recorded-music operation.

Music publishers work for musicians, songwriters and composers. They are responsible for licensing the intellectual property of their clients and ensuring that royalties are collected. Royalties are earned each time a song is downloaded on iTunes, sold on a CD, reproduced by another artist, or played on the radio, a television show, a movie or other media. Increasing independence of artists is another growing concern for the industry. As artists and bands grow more aware of the capacity of the internet to distribute their music, the need for artists, even small ones, to directly license intellectual property to record companies diminishes.

The chart below highlights the percentage of the market share that subsidiaries of the "Big 4" hold within the music publishing industry in 2011. As a result of EMI's sale, these figures look dramatically different in 2012, with Sony being an even bigger part of the publishing industry.

(IBIS World 2012)

Figure 2. 2011 Music Publishing Share

(IBIS World 2013)

Figure 3. 2012 Music Publishing Share

The advent of digital transfer of music online presents positive and negative possibilities for the music publishing industry. On one hand, overall demand for music may actually increase, despite the revenue from CD and online sales combined falling over recent years, as more fans access music by artists they were previously unaware of, creating greater opportunities and possibly increasing the value of assets held by the industry. However, as fewer consumers purchase their music legitimately, more direct lines of revenue, such as releasing songs for compilations and radio, means revenue could fall. Also, it becomes more difficult to identify which music is popular as illegal downloads are not publicized, hence discouraging companies from investing too heavily in music as a promotional tool.

One strategy the music industry has employed in this attempt to mitigate the negative economic effects of free music is to create an organization that attempts to collect royalties on behalf of artists whose music is being played and downloaded digitally. This institution, known as Sound Exchange, is a non-profit performance rights organization that collects statutory royalties from satellite radio (such as SIRIUS XM), internet radio, cable TV music channels and similar platforms for downloading and streaming sound recordings. On top of that, the "Copyright Royalty Board, which is appointed by The U.S. Library of Congress, has entrusted Sound Exchange as the sole entity in the United States to collect and distribute these digital performance royalties on behalf of featured recording artists, master rights owners (like record labels), and independent artists who record and own their masters."[25]

In short, analyzing documents, such as financial records, judicial reports, and transcripts of legislative hearings, reveals a trend of 360-deals becoming more popular amongst the Big 4, now the Big 3. They have been forced to utilize this strategy within recent years because contemporary changes in technology allow consumers to easily access music for free via the internet. On top of that, artists can now record and distribute music without the resources of a major label. Therefore, why would an artist sign with a major record label in the 21st Century?

[25] SoundExchange. 2012. soundexchange.com.

The next section discusses the findings from interviews conducted by the researcher. The purpose of these interviews was to gauge exactly how much independent hip-hop artists value controlling their image, branding, sounds recordings, and publishing copyrights. These interviews also served the purpose of discovering whether independent hip hop artists actually are the main financial beneficiaries of the revenues generated from their creative labor. These interviews were either conducted in person, over the phone, or via email. A full list of the interviewees can be found in the appendix.

"There Is No Industry for Dreams"

Marv Ellis is an Oregon-based rapper who has definitely noticed the shift in the way artists and major record labels interact. He says:

> Basically, when I first started rapping like 10 years ago, I was like, "I wanna get signed! I wanna get signed!" And now I'm like, "I don't wanna get signed! I don't wanna get signed!" Because basically, when it came to music, you could sell it back in the day. And now, people don't buy it. So what happens when you don't need to buy it and when there's a mass influx of people who can make the music in house and put it online, and all of a sudden their promotional capabilities are the same as a major artist, it puts pressure on the major record labels. So those labels started tying up musicians in LA and changing their deals to 360 deals so they could be making money off of marketing and promotion. So what happens is that the music really becomes a calling card to YOU. So now you're selling YOU. Your brand is YOU. [26]

According to Sony Records' Vice President of Sales, Scott Van Horn, there has definitely been a dramatic shift in how music companies sell & market music due increased access to free music:

> The US music industry revenue has been halved in the last 10 years—from $4B to $2B (2000–2010). Much of this has been attributed to the easy accessibility of 'free' downloads through a myriad of illegitimate sites, primarily in eastern European/Asian countries whose lax intellectual property laws allow them to flourish. [27]

Del the Funky Homosapien is an Oakland, California-based hip-hop artist who has witnessed this shift from the perspective of an independent artist, as well as from the perspective of an artist signed with a major record deal. In the early 1990s, Del released two albums for Elektra Records, a subsidiary of Warner Music Group. His relationship with Elektra, however, soon went sour. In 1997, about a month before the release of his third album, Del received a letter from Elektra stating that his contract had been terminated.

Elektra Records was experiencing the same financial hardships that other labels were experiencing at that time as a result of changing industry. In 2004, Warner decided to merge the label with another subsidiary, Atlantic Records. This merger, however, caused even more cut backs. According to a former Electra Vice President of Video Production, Diane Van Horn:

> Elektra was a stand-alone label (meaning it had its own promotion/sales/marketing/publicity staff) within the Warner Music Group. In 2004, Edgar Bronfman Jr. and other investors purchased WMG. They merged Elektra and Atlantic records together to cut expenses. Elektra lost about 60–70% of

[26] Marv Ellis. Interview conducted in Eugene, Or, on September 24, 2011.

[27] Scott Van Horn. Email questionnaire answered on February 12, 2012.

> its staff. The remaining employees were folded into Atlantic Records and began working with their staff and artists. [28]

Since leaving Elektra, Del has been a major part of the Hieroglyphics, one of the most successful independent hip hop groups of all time. Del recalls the financial problems that Elektra was having in the late 1990s:

> They weren't really making money any more. They wanted to keep me; but I was just being too demanding. They would ask me things like, "Would you work with a Premier? Would you work with a Pete Rock?" And I was like, "I mean yeah I'll work with them 'cause I like their music. But why should I? I mean I'm doing just what they're doing." And I know in their minds they were thinking, "No you aren't. You ain't making no money." [29]

The Hieroglyphics, which consists of seven rappers, a DJ, and a producer, is a LLC where all members are equal owners. They also release their music through their own label. The label, known as Hieroglyphics Imperium Recordings, was created by the collective in 1995 in order to publish and market the group's, and individual members', releases, as well as releases from other affiliated artist's that major labels would deem not commercially successful enough for mass distribution.

The Living Legends is another California hip-hop collective with a similar business plan as the Hieroglyphics. Consisting of eight rappers, the Living Legends is also an equal member LLC that also releases their music through their own label, which they call Legendary Music. Eamon Mulligan, the label's manager, believes that even in the case of independent hip-hop music there is "still definitely a case of capital resources, whether financial or human, affecting the amount of success of an artist and/or album-success being defined as units sold and monetary gains." [30]

To Mulligan, the internet has been a great tool for independent artists who are trying to compete with more popular mainstream entertainers:

> The internet has democratized the music industry and allowed people from the mainstream to the underground to play on the same level as each other… Sites such as YouTube are crucial because it is essentially today's MTV, but it is completely customizable at the click of a button and you can go from watching a Beyonce video to a Living Legends video. [31]

Mulligan also understands, however, that the music industry is a business. It doesn't matter whether the artist is mainstream or underground. He points out that a "truly independent artist though, with no label, at the end of the day would still like to be able to sustain themselves purely from their art. In a time where record sales are declining, the revenue streams for artists are becoming more and more sparse. One great way that an artist can earn revenue is from licensing their songs for movies, television, and video games." [32]

When it comes to licensing, though, it makes a big difference whether the artist is independent or signed to a record deal. If artists are independent, they receive the majority of the royalties for licensing the song; however, if artists have contracts such as expanded-rights

[31] Ibid.

[32] Ibid

deals, they might not receive any of the licensing profits. That is why Eligh, a member of the Living Legends, notes that although the business tactics are similar for all artists, independent artists maintain more control over their art.

For example, when it comes to promoting and putting on a live concert, he says that, although he's never been in the mainstream, all of the tactics for putting on a show are basically the same:

> You've got the promoter, you got the club itself, you got the artists, you got probably the managers of the artists, there's a bunch of people in play. But in the underground, you know, we book our own shows sometimes. Sometimes it's just us and the promoter and that's it. So in the underground, the power lies with the artist. [33]

Rhymesayers Entertainment is another independent hip-hop label that allows artists to maintain control over their own music, brand, and image. It was founded in 1995 by Atmosphere, a hip-hop duo consisting of Slug, the group's MC, and Ant, the group's DJ/producer. In 1999, the label became vertically integrated when it opened its own record store called Fifth Element, which is located with the label in Minneapolis, Minnesota. In March of 2007, Rhymesayers ditched its former distributor, Navarre Corp., and now has its catalog distributed by Alternative Distribution Alliance (ADA), WMG's "indie" distributor. Later that year, Rhymesayers Entertainment first began to distribute their music digitally. [34]

Some independent artists have even begun to throw their own live music festivals. Murs, a member of the Living Legends, has been instrumental in producing the Paid Dues festival, a live independent hip hop event that brings together some of the most popular and successful artists. On March 11th, 2006, the first Paid Dues festival sold out, with over 5,000 concert-goers packing the Shrine Expo Center in Los Angeles.

Following the success of the next Paid Dues show in 2007, Murs announced that the festival would begin touring with Guerrilla Union's Rock the Bells Festival, a much larger live music event. Formed in 1998 by Chang Weisberg, Guerilla Union began as a concert promotion company, but it has since evolved into much more. According to acclaimed DJ and producer 9th Wonder, these festivals are essential to the contemporary hip-hop culture. He says:

> I think it's beautiful man. I think what Murs and Chang are doing with Guerilla Union is something that we need. I mean we need it. I think it's dope. I love it. I love it. It's one of the only ways today that artists can get together and just sit and talk and see people we haven't seen in a long time and things like that. You know, we don't get to do that as much as we should. I think Murs and Chang are doing something that's needed. Without Paid Dues, without Rock the Bells, hip hop would be missing something. [35]

Despite the financial success of these festivals, though, they have been highly criticized for utilizing corporate sponsorship, such as Coca Cola. Sunspot Jonz, another Living Legend, is offended by this criticism of Murs. He says:

> Any one hating on Murs… fuck them. The whole point of this was to not go to work for someone who has no care of what you're about. They only see you as workers, as employees. Create your own moment for your life. That is what Murs did. He created his own moment for his own life. That is so

[33] Eligh. Interview conducted in Santa Cruz, Ca, on July 14, 2011.

[34] Kevin Beacham. Phone interview conducted on January 21, 2012.

[35] 9th Wonder. Phone Interview Conducted on September 12, 2011.

> much more important than you will ever realize. And you can say, 'Yo, you sold out for this, or you sold out for that.' I don't know what that even means. You didn't even know who I was before you were telling me I was selling out. My whole thing is this: There is no loyalty; there is no industry for dreams. There is no loyalty; there is no industry for dreams. There is no loyalty; there is no industry for dreams. Create your own moment. [36]

James Dunn, who does public relations work for such hip hop artists as Murs and the RZA, also agrees that working with major corporations can sometimes be a benefit to artists who are mainly independent. [37] For instance, in 2008, Murs released an album on Warner Bros. Records. While the record ultimately did not lead to the financial success that both he and the label expected, it sold over twelve thousand albums in the first week. It entered the sales charts at #43, and made the release Warner Brothers' best hip-hop showing of the year. It also allowed Murs to receive massive amounts of marketing and advertising for his album and his brand that he would have otherwise not received. In other words, working with a major label on a project or two can allow independent artists to reach a wider demographic of music consumers.

Spose is a hip-hop artist who used his successful relationship with a major record label to jump start his own independent music career.

> I signed a single deal with Universal Republic Records in 2010, for them to promote my song 'I'm Awesome,'" explains Spose. "The deal basically gave them a guaranteed hit record (as it already had become before they signed me) and gave me $35,000 with potential for more should Universal decide it would be to their financial benefit." [38]

Spose learned from his experiences interacting with Universal, and started PDank Entertainment:

> At a show for any PDank artist, the artist collects somewhere between 50% and 100% of the profits. I've played enough shiesty, terrible shows to know how to keep this percentage closer to 100% than 50%. Some venues and promoters, however, will take 50% right away before the artist sees a penny. [39]

The majority of money made by PDank artists comes from live shows. According to Spose, subsequently acts like the Educated Advocates, which contains three members instead of one, like Cam Groves or Spose, make less money at live shows than other artists:

> I think as tour-heavy artists like Wiz Khalifa have shown, a musician's money is made on the road. Basically, as label owner, I take 10% of the profits after recoupment. This is inconsistent with the industry because the big record labels, and even midsize ones, take between 75% and 90% of the profits from the artist. My deal with Universal afforded me just 16% of my sales after recoupment. [40]

RA Scion, from the Seattle, Washington-based duo Common Market, agrees with Spose's business tactics:

> Independence means you don't rely on others to take care of those tasks, which, in turn, means that your slice of the pie is larger. On the other hand, it means the pie itself is smaller, so there are inher-

[39] Ibid.

[40] Ibid.

> ent benefits and drawbacks. When Common Market had an agent and a management company, we got much larger guarantees and everybody got a little piece. These days, I do all the booking and management myself; the payoff is modest but it's all mine. If the point of the question is to establish whether or not it's more lucrative to be an independent artist then there's no definitive answer. U2 grossed $130M in 2011. I don't know about you, but I'd be hella happy with just 10% of that. [41]

Erik Abel is the producer for a Portland, Oregon-based independent hip hop group called Animal Farm. In his view:

> Hip hop is absolutely a microcosm of the world and the practice of capitalism. The major players in the music industry are the people with money, who have the capital to put hundreds of thousands of dollars into hiring publicists, radio promoters, video promoters, placing advertisements, etc. The underground community, however, needs to be more creative, utilizing guerilla marketing tactics and creating higher quality music for the most part. Even within the underground though, YouTube views, press, free music download counts, and twitter fans are all accumulated with the hopes it will lead to additional album sales or interest from sponsors or people with deeper pockets within the music business. [42]

In short, many artists remain independent because it is more financially profitable to do so, not because they are adhering to any sort of moral or ethical code. Even artists such as Del, who has had tremendous success as an independent artist, wouldn't rule out the possibility of signing with a record label if the right situation would come along. The main reason most artists remain independent is because they want to control their personal brand. Instead of having some record company commoditize their brand, they would rather commoditize it themselves and be the main beneficiaries of the profits generated from their labor.

The Fetishism of Independent Hip Hop

In order to be a financially successful independent hip-hop artist in the 21st century, artists must create hype for their music and personal identity in order to convince consumers to make the seemingly irrational choice of purchasing music that is, most likely, readily available to them for free. This means that a major component of being a financially successful musician is generating a fetish for one's music and identity. In other words, in order to allow independent hip-hop artists to be financially successful, an artist's music and brand must become a fetishized commodity.

Mac Miller's success can certainly be attributed to his ability to create a fetish for his music and personal brand. After years of incessant touring and releasing his music for free, he had created so much hype for his products that when he finally released a full-length album music consumers bought his albums in droves. He received thousands of album sales despite already having a reputation for allowing his music to be freely distributed throughout the internet.

Independent hip hop itself, however, is also becoming a fetishized commodity. This is evident when looking at the rising trend of conglomeration between major record labels and independents. For instance, most of the independent artists and record labels analyzed in this study are somehow connected to one of the "Big 3" major record companies: Rhymesayers Entertainment signed a promotion, marketing, and distribution deal with Warner Music

[41] RA Scion. Interview Questionnaire answered on January 10, 2012.

[42] Erik Abel. Email Questionnaire answered on August 23, 2011.

Group's Independent Label Group; Rostrum has a physical distribution partnership with Fontana, the independent artists' sales and marketing division of Universal Music Group; Murs recorded an album for Warner Bros. Records; and Spose got started by taking a deal from Universal Republic Records.

Contemporary hip-hop artists don't rely on album sales any more as a main outlet for financial success. According to DJ/producer Nima Fadavi, however, just because a song is obtained for free doesn't necessarily mean that the song no longer has any value. Instead, as Marv Ellis pointed out, the recorded music is really a "business card" that gets music consumers to pay attention to their personal brand and identity. Therefore, if recorded music is no longer a viable option for gaining profits, independent hip-hop artists need consumers to attend live events and purchase merchandise in order to be financially successful.

In terms of live events, the labor of independent artists is commoditized less than the labor of artists who are signed to expanded-rights deals because independent artists receive the majority of the profits made from the show, as opposed to those artists with expanded-rights deals whose label makes the majority of the profits gained from the event. Even in the case of festivals such as Rock the Bells or Paid Dues, where there is corporate sponsorship such as Coca-Cola, the artists, not the sponsors or promoters, take home the majority of the profits. Therefore, although there is corporate sponsorship, festivals such as Paid Dues and Rock the Bells represent a resistance to the dominant means of production because they allow the artists to be the main financial beneficiaries of their labor.

In other words, while independent hip hop artists must work to create a fetish for their records, live events, and merchandise, they attempt to resist the dominant means of production by not having their labor commodified. However, major corporations such as Coca-Cola and the music industry's "Big 3," have figured out how to profit from the publishing and distribution of recorded independent hip-hop music, as well as live events and merchandise. On top of that, independent hip-hop artists still rely on exchange-value, not use-value, in order to be financially successful. Therefore, independent hip hop itself has become a fetishized commodity.

The Internet, Free Music, and Subcultural Branding

The internet has undoubtedly played a major role in the way the business structure of the music industry has shifted over the past couple of decades. Major recording labels, as well as independent hip-hop artists, can no longer rely on album sales as a consistent source of revenue. Except for the extreme cases, such as artists like Mac Miller, music consumers are no longer purchasing music at high enough rates in order to rely on record sales as an outlet for financial success.

The increasing independence of artists is another growing concern for the industry. As artists grow more aware of the capacity of the internet to distribute their music, the need for artists to have their intellectual property licensed by record companies diminishes. In response, major record labels have sought out more expanded—rights deals in order to profit from every aspect of the artist's brand and identity.

As RA Scion pointed out, artists and groups such as U2 only receive about 10 % of the revenue generated from their music and products. Yet, their music and products bring in millions of dollars every year; so, they make significantly more money than most independent

hip-hop artists. Therefore, the central question is: Do you want a lot of a little or a little of a lot? Artists such as Immortal Technique, Del, and 9th Wonder, as well critical philosophers and political economists such as Marx and Engels, would argue that it is better to receive the majority of the profits which come from one's labor, as opposed to allowing one's own labor to become a commodity.

In some ways, however, even artists that are completely independent still have their labor commoditized. For example, the venue that hosts the show needs the artists' labor in order to make money. That also goes for the show promoters, artist managers, and companies involved in making the merchandise. Therefore, independent hip hop itself has become a fetishized commodity.

Independent hip-hop artists must rely on performing at live events and selling merchandise in order to be financially successful. That means they need to create a fetish for their own personal brand, as well as for the merchandise they are selling. In other words, an artist's albums, live events, and merchandise all need to become fetishized commodities in order for the artist to be financially successful.

In that sense, independent hip-hop artists offer no resistance to the dominant means of production. They are still participating in the reification of the commodity-form capitalist system. Even artists, such as Immortal Technique, who dialectically critique the dominant means of production, are still guilty of contributing to the creation of what makes this capitalist system exist: fetishized commodities.

There are many examples of subcultures being coopted by corporate brands. The independent hip-hop industry certainly does not escape this distinction. Companies, such as Coca-Cola, have begun to invest in hip hop shows and festivals; Smirnoff sponsors a show on Viacom-owned BET (Black Entertainment Television) that's centered on a DJ competition; and most independent labels need to utilize publishing and distribution outlets associated with the "Big 3."

Therefore, independent hip hop is also guilty of turning its consumers into a commodity. Major corporations that have realized the widespread popularity of hip-hop music and products make investments that allow them to profit from the commodification of the culture. These corporations use subcultures as a way to market their brand to a particular demographic. In other words, by allowing corporations such as Viacom, Smirnoff, Coca-Cola, and others to fund events, to invest in merchandise, and to profit from the labor of the artists, independent hip hop contributes to the creation of the audience commodity.

This promotes the dominant mode of production. As noted earlier, the mode of production is "the way in which a society chooses to appropriate and allocate all of the productive resources and surpluses needed for and created by the process of production;" and it should be noted that "capitalists create rules defending unequal distribution determined by competition between capitalists and each individual's willingness to pay for goods and services."[43] In regards to commodification, the capitalist mode of production helps to separate conception from execution within the media industry. For instance, it is not uncommon for the conception of a commodity to begin within working-class culture, and then be transformed into a product and offered back to working class audiences.

[43] Dean Colby. New media as a new mode of production? In McKercher (Ed.), *Knowledge workers in the information society*. 1997, 193.

This is certainly the case for hip-hop music created by artists who are signed to major record labels. Those major corporations invest in artists in order to profit from a specific culture. In terms of hip hop, major record labels look for artists who are consistent with the image of hip hop that they deem to be profitable. The artists then release music that is consistent with that image.

Independent hip-hop artists, however, are not guilty of contributing to this trend. Although they still reify the commodity-form capitalist system by creating a fetish for their personal brand and turning their consumers into a commodity, independent artists make music that is still authentic and genuine. Their music isn't influenced by the opinion of a major record executive.

Therefore, while there are plenty of similarities between being signed to a major record label and being an independent artist, there are also some very important distinctions. For example, independent artists take home the majority of the profits generated from their music, while record companies are the main financial beneficiaries of the profits generated from artists signed to their label. On the other hand, major and independent artists both rely on turning their music, merchandise, personal brand, as well as the hip-hop culture itself, into a fetishized commodity.

Independent artists are also guilty of turning their fan base into a commodity. Most independent artists and labels rely on subsidiaries of the "Big 3" for publishing and distribution. With the dramatic decrease in album sales, major corporations are given more opportunities to invest in the marketing, advertising, and promotion of independent hip-hop artists, labels, and events as independent artists are forced to utilize touring and selling merchandise as their main way of generating profit.

In many ways, however, these new trends within the music industry are empowering for independent artists. They are able to personally control the entire process of recording, distributing, and advertising their music. Independent artists have had so much success, in fact, that major record labels are being forced to change their business strategies in order to keep up with a dynamic market that is being greatly influenced by contemporary changes in culture and technology.

Although this study fills a needed void in the existing literature pertaining to independent hip-hop artists, there are still many more opportunities for research. This article is hindered by the researcher's limited access to potential interviewees and the financial records of independent artists. Yet, this study represents a significant contribution to the study of hip hop.

No other studies have focused specifically on how the success of independent artists is a major influence on the business strategies of major record labels. There are also no other studies that compare the ways in which independent artists commoditize their own brand and the ways in which a record company commoditizes an artist's brand. This study does just that.

This study reveals that independent artists make the majority of their money through touring and selling merchandise. Like the rest of the music industry, hip-hop music has experienced a dramatic decrease in album sales, making physical distribution of recorded music and outdated strategy for making money. This has had a major impact on the major record labels. Noticing the success of independent artists who focus specifically on touring and selling merchandise, major record labels have made a concerted effort to sign more of their artists to 360-deals in order to profit from every aspect of their artists' brands and identities.

While most independent artists attempt to be the main beneficiary of the revenues generated from their labor, not all of them actually are. The Big 3, through their many subsidiaries, dominate the music publishing industry. So much so, that it is difficult to release any recorded music without using a subsidiary of the Big 3. Therefore, many artists now release music for free and focus only on touring and selling merchandise.

Even in the case of exceptions, such as Mac Miller, where independent artists are able to profit from their album sales, free online distribution plays a major role in promoting their music and creating a fetish for their brand and identity. That is why touring and selling merchandise will become the main focus of financially successful independent hip-hop artists and labels in the years to come. Independent hip-hop artists who wish to be financially successful will need to continue to tour incessantly.

This will result in the opportunity for more corporate sponsorship of tours, festivals, and merchandise. In that sense, financially successful independent hip-hop artists will continue to turn their fans into a commodity. Like any person looking to profit in the entertainment industry, independent hip-hop artists contribute to the audience commodity. By allowing major corporations such as Coca-Cola to profit off of live music events and merchandise, and by allowing the "Big 3" to continue to dominate the publishing and distribution sectors of the music industry, the independent hip-hop culture itself is increasingly becoming a fetishized commodity.

CHAPTER 32

Autonomy, Integration, and the Work of Cultural Intermediation in Indie Games

Matthew E. Perks, Felan Parker, Jennifer R. Whitson, Bart Simon, Gabrielle Lavenir, Ceyda Yolgörmez, Pierson Browne, and Brian Schram

Media Industries Journal 6, no. 2 (2019). https://dx.doi.org/10.3998/mij.15031809.0006.202.

Abstract [1]

Based on empirical research, this article addresses the role of cultural intermediaries in the production, distribution, and reception of independent or "indie" digital games. Festival and showcase curators, local community organizers, co-working space managers, promoters, critics, funders, granting agencies, and other support actors are central to sustaining indie game cultures, but are often overlooked. Our research makes visible the diverse taskscapes of cultural intermediaries; the wide variety of brokering, translating, value-ascribing, connection-making, and care work involved; and the attendant tensions and challenges. We contend that cultural intermediary work in the game industry is characterized by precarity, extensive and largely invisible behind-the-scenes work, complex networks of interdependence and sup-

port, blurred boundaries between the personal and the professional, and a delicate balance between autonomy and integration.[2]

Keywords

Game Industry, Indie Games, Cultural Intermediaries, Autonomy

Introduction

In the industry and culture of digital games, community and event organizers, festival coordinators, showcase curators, co-working space managers, promoters, critics, funders, granting agencies, and other such "support" actors are often seen as secondary or peripheral to the "real" work of making games (or else overlooked completely). Based on ethnographic and interview research, we contend that these cultural intermediaries play a pivotal role in small- to medium-scale independent or "indie" game production, distribution, and reception. Our research contributes to growing critical awareness and understanding of cultural intermediation and illustrates that the experiences and practices of cultural intermediaries are more diverse and dispersed than typically understood. We argue that cultural intermediation is multifaceted, spread throughout the industry, and involves an immense amount of underappreciated labor that goes beyond common conceptions of cultural intermediaries as primarily gatekeepers or cultural brokers. Examining cultural intermediation in the game industry paints a very different picture of indie game development—and cultural work more generally—compared with romanticized popular representations,[3] characterized by precarity, extensive and largely invisible behind-the-scenes work, complex networks of interdependence and support, and a delicate balance between autonomy and integration.[4]

---

[2] Matthew E. Perks is a PhD student at the University of Waterloo in the Department of Sociology and Legal Studies. His research focuses on the socioeconomics of the video game industry and how these inform and alter the design decisions and identities of video game developers. Felan Parker is assistant professor of Book and Media Studies at St. Michael's College in the University of Toronto, specializing in digital media, media industries, and game studies. His current research, supported by a SSHRC Insight Development Grant, explores the production, distribution, and reception of "indie" digital games. Jennifer R. Whitson is in University of Waterloo's Department of Sociology and Legal Studies. Along with ethnographies of game developers, she studies digital media surveillance. She is an associate editor of Surveillance & Society and her work appears in Economy & Society, Games and Culture, and New Media & Society. Bart Simon is associate professor of sociology and director of the Milieux Institute for Arts, Culture and Technology at Concordia University in Montreal. His work combines cultural sociology, game studies, and science and technology studies to look at modalities of play and technology in everyday life. Gabrielle Lavenir is a PhD student in Sociology and Anthropology at Concordia University (Montréal). Her research focuses on older videogame players and older adults' relationship to digital technology. Gabrielle is on the board of the Observatoire des Mondes Numériques en Sciences Humaines (Paris) and is part of TAG at Concordia. Ceyda Yolgörmez is a PhD student in Social and Cultural Analysis program of Concordia University. Her research focuses on how artificial intelligence technologies change everyday life of their users. She studies situated interactions with artificial intelligence agents and aims to see whether new forms of socialities develop out of these encounters. Pierson Browne is a PhD student at the University of Waterloo. His research focuses on the propagation of concepts and information through the social networks formed around and within communities of play. Brian Schram is a PhD candidate and in the Department of Sociology and Legal Studies at the University of Waterloo, Ontario. His work centers around the historical and contemporary surveillance of queer persons, extending from the postwar period to our current era of omnipresent digital media and dataveillance.

[4] Mark Deuze, "Work in the Media," *Media Industries Journal* 1 (2), published electronically February 1, 2014.

Cultural intermediation, originally theorized by Bourdieu [5] but more recently taken up and elaborated by scholars in sociology, media studies, and cultural studies, refers to work that takes place *between*, *but apart from*, other actors and sectors within a field of cultural production. Cultural intermediaries are in part gatekeepers, brokers, and mediators that use their strategic in-between position, specialized knowledge, and networks to connect cultural producers with the resources, institutions, and audiences they need to succeed. [6] Cultural intermediaries are connective tissue, sitting "at the boundaries of multiple fields, not only between culture and economy but also culture, society, and community" [7] and shaping the heterogeneous relations between diverse actors and activities that make up cultural industries. [8] Research on cultural intermediation reveals a diverse and growing range of frequently overlooked cultural workers wearing many hats, herding many cats, and exerting a constitutive influence on their fields. [9]

There is a pressing need in media and cultural industries research to examine what cultural workers actually think and do, [10] but this can be difficult to accomplish. The work of cultural intermediaries has a low degree of organization, formalization, and recognition (both internally and externally) that colors their careers with uncertainty and disrupts their sense of identity. Given the strong emphasis on the work of "creatives" (i.e., designers, programmers, artists) in game development and other cultural industries, intermediation is rarely fully visible, existing in the interstices and on the peripheries. Geoffrey Bowker and Susan Leigh Star describe a similar problem associated with classifying and defining just what it is that nurses do. [11] This inability to describe work practices has negative impacts, including the devaluation of essential work, as well as massive variability in quality and consistency in everyday practice, recognition, and education. [12] Following this trajectory, and respond-

ing to Julian Matthews and Jennifer Smith Maguire's call to examine "the broader range of occupations involved in cultural production" and "better specify cultural intermediaries' shared contexts and characteristics, and their points of differentiation," we specifically focus on defining the taskscapes of cultural intermediaries in games.[13] Our research also aligns with Beth Perry, Karen Smith, and Saskia Warren's conception of a "third wave" of cultural intermediary studies that reclaims and revalues this work.[14]

As we have argued elsewhere, cultural intermediation tends to be difficult to discern and "only becomes 'sensible' within the broader networks of intermediaries spread out across the entire cultural industry in which they are embedded."[15] Unlike some more traditional intermediary jobs (such as the local geek shop owners examined by Benjamin Woo),[16] cultural intermediaries in the game industry are members of a geographically dispersed and socially fragmented pseudo-occupational group, often lacking a fixed place of work or a regular schedule. The cultural intermediaries studied in this article include co-working space coordinators, festival curators, funding and awards panel judges, community organizers, and public advocates for indie games who (at least in their intermediary capacity) are not affiliated with any one game development team and are distributed across different international game industries and scenes. In order to address these issues, we hosted an international symposium at the Technoculture, Art, and Games Research Centre at Concordia University, explicitly framed as a way to better understand their work. As a kind of pop-up water cooler, our unconventional symposium-as-research-site method was able to bring indie intermediaries and their networks to the surface, granting participants who rarely have time to pause for reflection or mutual commiseration the time, space, and social prompting to do so. In the process, we were also able to collectively name and make visible the particular form of cultural work that our participants are engaged in, which generally goes unnamed and unacknowledged even by those who perform it.[17] The site was documented via note-taking, photos, audio recordings of interviews, and video recordings of talks and panels. Written ethnographic vignettes and reflections, along with the interviews, are the primary basis for our arguments in this article.

In this article, we strive for a more fully realized account of the work of cultural intermediation, one that takes into consideration its diversity and intermediaries' own difficulties in establishing and maintaining their positions within cultural industries. First, we map the multifarious taskscapes of cultural intermediaries; second, we examine some of the core functions of cultural intermediation: brokering, translating, and ascribing value; third, we examine the wide variety of care work involved in cultural intermediation that routinely goes unrecognized; fourth, we examine how cultural intermediaries balance the relative

autonomy necessary for intermediation against integration into the communities, networks, and industries in which they operate. We conclude by considering the wider implications of the many tensions and blurred boundaries that inhere in the process of cultural intermediation, between autonomy and integration, personal and professional, work and play, art and commerce, accumulation and sustainability.

Figure 1. Participants work to organize their taskscape Post-It notes into emergent categories. Photo by Authors.

Mapping Cultural Intermediary Taskscapes

Identifying a commonality between different kinds of cultural intermediaries in the game industry is relatively straightforward, but it is more challenging to identify what their actual day-to-day activities look like. The symposium offered an opportunity to ask intermediaries directly about their work and to have them discuss and compare their respective "taskscapes"—the particular range of roles and duties they take on. To draw out this theme, we organized a small group activity where participants listed all their tasks in a typical week on "Post-It" sticky notes and collaboratively sorted the resulting 440 notes into emergent categories (Figure 1), offering sketches of an archetypal cultural intermediary's taskscape. Examining how identities are reconciled in the face of this unruly diversity of tasks allows us to more fully recognize, connect, and make visible the work of cultural intermediation.

We organized these tasks into four categories, relating broadly to game-related activities; outreach, networking, and promotional activities; business and finance-related activities; and

management-related activities (Table 1). The broad range of activities is noteworthy in itself, but also emphasizes the considerable amount of "slippage" between tasks as many crossed multiple categories. Cultural intermediaries spend a substantial amount of time immersed in game-related activities, whether playing, making, or both. Playing as many games as possible is key to maintaining cultural currency and feeds into other tasks such as networking, research, and knowledge-gathering activities. Outreach, networking, and promotional activities centers on collecting and disseminating information, connecting others, and directly promoting one's own activities, events, and organization. The final two categories relate to managing both material and human infrastructures. Business and finance-related activities relates to applying for (and dispersing) funds, and management-related activities refers to the logistic and maintenance work associated with operating physical spaces (e.g., events and offices), as well as activities associated with managing humans, such as coordination, mentorship, and conflict resolution. These management tasks, and the amount of time and effort required of them, occupied a significant portion of our discussions.

Table 1. Taskscape of Cultural Intermediaries.

Typology	**Key tasks**	**"Post-It" examples**
Game-related activities	Game-making; game-playing	Writing game prototypes; supervising art direction; writing code; fixing bugs; playtesting; reviewing games; submitting for games festivals
Outreach, networking and promotional activities	Social media; direct communication; contact building and networking; event attendance	Browsing and posting on social media; updating websites; reading, answering, writing e-mails; introducing contacts to one another; moderating discussions; going for drinks; visiting games festivals, tournaments, opening parties
Business and finance-related activities	Applications; accounting; dispersing funds	Writing applications for jobs, funds, and grants; assisting with applications; writing and assessing budgets; navigating government bureaucracy; negotiating funding, rent, and investments; accounting; preparing for audits; invoicing members; paying bills
Management-related activities	Spaces: maintaining/managing material infrastructure; event planning; travel planning	Organizing and attending meetings; scheduling events; organizing maintenance; buying supplies; booking travel and attending; curatorial discussions and decision making
	Humans: managing human resources; relationship management; leadership	Providing emotional support; reviewing others' work; defusing conflicts; mentoring

Table by Authors.

A cultural intermediary's claim to authority rests on the competent execution of a diverse taskscape, aspects of which may not align with a clear occupational role. Amir provides a telling anecdote, about his first game industry job:

> I had to get business cards printed, and Andy, the boss, was designing the card and was like, 'What do you want your title to be on the card?' [. . .] So I said: either put 'developer' on it or leave it blank. In some ways, putting a title on the card will be confusing, because I will be doing so many different things.

As Amir notes, what he actually did within the studio, and in the larger community, did not fit into a discrete occupational category. The status of intermediaries is always uncertain—untitled—even as they exert considerable influence.

Bringing together indie game cultural intermediaries and collectively mapping and discussing their taskscapes reaffirmed many of the tasks traditionally associated with cultural intermediaries (networking, curating, brokering of material and symbolic resources, etc.) and also highlighted activities and agencies less commonly associated with the role. This exercise suggests that the most commonly shared characteristic may be in their uncertain and always-negotiated boundaries; we might even be tempted to answer the question of what cultural intermediaries actually do simply by saying "everything."[18] This is a challenge for cultural intermediaries, whose struggles to define their own work and workload ultimately reduce their visibility and external understanding of what they do. But this ambiguity is also their strength: Cultural intermediation thrives on flexible connections across multiple networks and is inevitably an uncertain endeavor. Understanding the tensions faced by cultural intermediaries who may be unable to construe their own work is the focus of the rest of this article. Drawing on interview data and observations gathered at our symposium-as-research-site, we offer a deeper analysis of the slippages between autonomy and integration faced by cultural intermediaries. In doing so, we offer new insights into the evolving ways that cultural intermediaries perform and characterize their own work, and in particular the under-explored question of how intermediaries situate themselves in relation to one another.

Brokering, Translation, and Ascribing Value

Cultural intermediation in indie game development, as in other industries, conditions the social and cultural existence of its products. Cultural intermediaries help make certain games visible and understandable to the various actors who co-create "game culture." Leveraging their in-between position and connections, intermediaries gain access to, broker, and translate valuable social, cultural, and economic resources such as access to publishers and platforms; press, influencer, and industry connections; sources of funding; and featured spots at festivals and showcases.[19] These resources are increasingly seen as a necessary precondition for indie game developers to legitimate their work in crowded digital marketplaces dominated by a small handful of heavily marketed AAA franchises backed by massive, vertically integrated, multinational corporations. Reliant instead on more "horizontal" management and mentorship structures, the context of indie game development is unique in its heavy reliance on social capital, cultural intermediaries, and tastemakers to break through an oversaturated and competitive market. The work of cultural intermediaries is thus especially important for smaller independent studios who cannot access these platforms, resources, and networks on their own (or who can access them but are not able to leverage them to their full potential).

As Liz McFall contends, intermediation is not only about qualifying finished products for consumption, but is rather an open-ended process of "forging more and more relationships

in an expanding network" in order to secure the position and status of a cultural object or practice.[20] Tracey describes how connections are commonly brokered between developers and influential industry actors in the co-working space she manages:

> if you're going to release on Steam, I should know, so that when the opportunity arises, I can help [you] meet the influencers and tastemakers. Kickstarter was in the space last week and one of our teams has a Kickstarter campaign, I told them to go and sit with Luke [to discuss their campaign].

Networking events organized by or hosted in the space offer potential points of connection that Tracey is able to mediate. Cultural intermediaries also broker connections to other intermediary institutions, such as festivals, awards, and press coverage, that have a ripple effect in the wider local community. Co-working space directors, local developer organizations, and other intermediaries thus produce (more or less permanent) hubs of inward and outward connection for indie developers that organize the flow of mutual encouragement, mentorship, advice-giving, reviewing, and knowledge exchange (about funding institutions, financial opportunities, working conditions, etc.) as well as more substantive opportunities.[21]

Aspiring and early-career independent cultural producers often operate with little to no actual capital, but "alternative forms of capital—social, cultural, and symbolic—are readily available resources to be mobilized and converted in the struggle to build a career."[22] Cultural intermediaries play a key role in these processes of "capital intraconversion,"[23] for their own benefit and for others. For instance, they can trade on the "indie coolness" of the scenes and communities they inhabit in exchange for sponsorship and in-kind contributions. Amir recounts how he used his co-working space's reputation in his local indie scene to obtain a financial contribution from a large tech company that "doesn't have a very good reputation, because devs would talk about how much they disliked working there. I was like, your HQ are in [this city], I'm doing this thing in [the city] if you really care. They gave us 50,000 dollars." In this case, Amir was able to identify an opportunity to "spend" cultural capital (in the form of indie credibility) to gain economic capital (in the form of a major sponsorship).

Indie intermediaries also facilitate the trajectory of developers' creative work outward and toward various audiences, some of which may fall outside of the usual gaming public. Independent games have a complex relationship to cultural legitimacy, sometimes materialized in an ambition to be understood and appreciated in artistic terms, which may be problematized by commercial or enthusiast ambitions.[24] This version of indie legitimacy is discursively positioned against the mainstream commercial game industry's traditional focus on marketing and entertainment. When indie game developers want their games to be recognized as a form of artistic expression (whether for the sake of prestige or in order to

access material resources like arts funding), they may look to cultural intermediaries with one foot in the art world or other media industries, who are equipped to perform the necessary legitimation and translation work.[25] As knowledgeable and well-connected actors in indie scenes, intermediaries contribute to legitimation of games and developers, whether within the game industry or in the broader cultural and artistic field. Emilia explicitly describes her work with a local indie game community organization in these terms. Game culture is "very commercialized" and often seen as juvenile, making it hard for developers to gain outside recognition; so much of her work involves adapting time-tested legitimation strategies from other artistic fields such as film and theater for indie game developers.[26]

Emilia organizes workshops in which she literally translates the commercial, fan language of game developers into an artistic language that is more appropriate for cultural institutions such as arts councils and granting agencies, which may not be accessible to developers otherwise.[27] "People call themselves 'content creators' instead of artists. They talk about return on investment, you don't even know what that means!" She provides an example:

> One particular applicant wanted to make a mobile game with a comedy clown duo. It was theater. [. . .] But the way they described it in the application was, it's a franchise, pre-existing intellectual property. That's an example of those terms that the jury read and think, "That's not something an Arts Council should fund." But if you framed it in terms of artistic collaboration with theater, merging media art and theater, that would have been perfect.

In order to facilitate the integration of game developers into the wider artistic field, Emilia encourages them to "de-specialize" the language they use, coaching them on "how to describe your game to people who don't play games" because "not everyone on the jury is gonna be a video game player." Similarly, co-working space director Lee and festival organizer Viktor maintain active relationships with government and arts agencies as a means of mediating between developers and potential sources of funding beyond investors, loans, and other market-oriented models emphasized in the game industry, in doing so influencing how governments "define and place" games as a medium and a business.[28] Mobilizing their expertise, social connections, and cultural capital as a "third who translates," each of these intermediaries uses their position to bridge across seemingly disparate cultural worlds.[29]

Qualifying and adding value to cultural objects is a well-established function for cultural intermediaries, and several strategies for tastemaking and highlighting certain games among the chaff of a crowded indie market were discussed by participants involved in festival curation and event organizing. Festivals and showcases for indie developers can be incredibly important for cutting through the noise and gaining access to larger audiences and key industry contacts. Identifying trends, highlighting promising but not yet well-known developers, and

putting games in front of other influential intermediaries are common tactics.[30] Describing his event coordination and promotion work, Viktor explains that he spends his days talking to journalists about what the current trends are in digital art and indie games, a straightforward instance of tastemaking in which the cultural intermediary uses their specialized knowledge and position to put forward an authoritative stance on what is relevant in their cultural field, circulated via field-specific or mainstream media coverage. However, like other participants, he expresses uneasiness with the idea he is a cultural gatekeeper. Tastemaking activities do not always play out as intended and may be taken up or misrepresented in unexpected ways. Viktor often finds his words and intent decontextualized, becoming a spokesperson for game design practices and technologies he is personally ambivalent about, or outright critical of, such as virtual reality (VR). This is echoed by Robert, who states he is aware he "works for [Facebook CEO Mark] Zuckerberg" when he advocates for VR and that this "isn't a good feeling." In these cases, cultural intermediaries have found themselves uncomfortable with the compromises and tensions inherent in their work. By bringing together many intermediaries into one place, with the explicit goal of reflecting on their work, our findings demonstrate that the support cultural intermediaries offer to cultural producers and other actors is manifold and far-reaching, but not without complications.

Fostering Care and Boundary Work

Contrary to some formulations of cultural intermediation as the insertion of self-interested, exploitative "middle men" between production and consumption, we contend that cultural intermediation is not a simple or straightforward process limited to value extraction and symbolic qualification of cultural objects—nor is this how intermediaries understand or experience their work. Intermediation actively shapes *cultures* of production. As McFall contends, "production and consumption have to be always already, dynamically connected to continue at all," and intermediation is a distributed, nonlinear process involving "a whole 'crowd' of intermediaries [. . .] many of whom may be engaged in activities that are not easily designated production or consumption, but might be anywhere within the surrounding space."[31] This resonates with our conversations with game industry intermediaries, who point to aspects of their work that are more aligned with noncommercial, non-materially productive work such as parenting. Accordingly, we argue for a conception of cultural intermediation that renders visible the most invisible, naturalized aspects of an already largely invisible occupation.[32]

Emphasizing commodification or gatekeeping as the primary task of cultural intermediaries does not reflect how cultural intermediaries themselves understand their work. Much of the work of cultural intermediation is personal, relational, and emotional at its core.[33]

Our participants are acutely aware of this: One "Post-It" note from the taskscape exercise reads, "How hard it is to reject someone's work/project, esp. when you know them well: extra care and emotional work to make the feedback less difficult to hear." As Perry et al. argue, formulations of cultural intermediation that emphasize self-interest and personal gain are ill-equipped to account for more community- and sustainability-oriented aspects of cultural intermediation, but these are central to the self-identification of many intermediaries.[34]

Community-minded cultural intermediaries express a strong sense of responsibility for attracting and retaining game developers in indie game scenes. They perform emotional and care work in order to ensure that projects go through and teams stay together, performing invisible, gendered tasks that fall outside of the game development "triangle" of designer-coder-artist and can go neglected on smaller indie teams.[35] This side of their work causes some friction, because it complicates the notion that intermediaries must maintain a degree of autonomy and not become too deeply involved—after all, they generally work with many different teams and projects at the same time. In conversations with co-working space coordinator Tracey, she remarks that while she is not a member of any one team, and at the end of the day is not responsible for any decisions, she performs a great deal of work and care to aid these studios. She manifests this care as an "open arms policy" of membership that is not reducible to the for-profit business model of other co-working spaces. This extra work, of fostering a space of acceptance and support for developers, is work that goes unrecognized among Tracey's day-to-day tasks of managing the space but is both resource- and time-consuming.

The number of sticky notes with what may be perceived as nonwork activities—such as playing games or having drinks—suggests an erasure of boundaries between the professional and personal that is endemic throughout the game industry. As Nancy Baym argues, the "boundary between social and economic relationships has always been far blurrier than theoretical distinctions might suggest,"[36] and the work of cultural intermediaries is characterized by blurred boundaries between work time and personal time, as well as between personal, professional, and mentoring relationships. Our participants are keenly aware of this erasure of boundaries. For example, having a meal with friends is a form of work when all your friends work in the same industry, and even more so when they are looking to you for informal mentorship or connections. Many cultural intermediaries work constantly and certainly do not have prototypical nine-to-five days. Thus, they fit personal responsibilities into the idiosyncratic rhythms of their workdays (driving the kids to school, cleaning the apartment, etc.), compounding the erasure of work/life boundaries. This is consistent with research on cultural work and intermediation in other fields—the work of intermediation bleeds out into all aspects of everyday life, making their work even more difficult to "name" and study.[37]

During the symposium, several participants indicated displeasure with this aspect of their work, among themselves and in interviews, and their comments suggest a "helping fatigue." Tracey explains that she resents having to provide certain kinds of care to developers in her space, which she feels should not be part of her job: "Most of the emotional labor management is when teams don't talk to each other and try to talk through me or vent. [. . .] they use me as a sponge to hold their emotions," she explains, expressively capturing the gendered dynamics of emotional labor and care work in cultural intermediation, which women are expected to take on regardless of their actual job. [38]

A parenting metaphor emerged to describe this dimension of intermediary work. Kyra is sometimes referred to in her scene as "indie mom," an honorific she greets with ambivalence, while Lee is often confronted with the reality that he is acting as both a landlord and a mentor to the developers in his co-working space. The tension between these competing identities becomes apparent when they backfire: Kyra notes studios that have failed to find commercial success may hold intermediaries responsible as invested parent-mentors, rather than as noncomplicit landlords. In one respect, Lee's identity is tied to the idea that he is here to help these developers learn to run their businesses—a role Tracey also identifies with—but they are often put in difficult positions. Lee compares his space to a university dormitory, notorious for cramped conditions and uncleanliness, and describes his discomfort with needing to chide developers to clean the kitchens before sponsors, government agencies, or press visit the space. The delicate balance required for cultural intermediation is complicated by the many roles and tasks they are expected to perform.

While some intermediaries are placed in roles where care is expected, others actively care for their scenes and communities through advocacy for diversity and inclusion. All cultural intermediation work is, of course, political [39] —if not undertaken with an explicit political mandate, it is likely reproducing the inequitable status quo of the game industry. [40] Although most participants spoke in favor of improving diversity, Emilia addressed the issue head on, explaining that her mandate is primarily about making indie gaming spaces less exclusionary. To this end, she has implemented several changes regarding her staff's salary and working conditions: $25/hour for everyone, converting volunteers into paid employees, and taking diversity explicitly into account during recruitment. This effort shows how intermediaries can direct their efforts to pursue a form of "creative justice" that actively works to counter the precarity of cultural work in order to do right by the people involved. [41]

While gatekeeping and tastemaking are undeniably part of the process of cultural intermediation, close examination invites a more multifaceted understanding of their work. Much of this work involves care, spread across the taskscape in subtle ways and rarely noted in critical

work on the production of cultural value and taste.[42] As such, we argue for a conception of cultural intermediary work that is affective, everywhere, and dispersed throughout networks of production, distribution, and reception. Moreover, the blurring of boundaries inherent in the work of cultural intermediaries—between care and commerce, interpersonal and professional—impacts how these intermediaries are situated in creative communities and industries and how they establish their autonomy as cultural workers themselves.

Networks, Autonomy, and Integration

Expanding the cultural intermediary taskscape to include activities usually left invisible or considered nonwork broadens our understanding of this category of cultural work. This also has implications for how we understand the struggle for autonomy and authenticity in creative work and how they are established, maintained, and experienced through their diverse array of activities. We contend that cultural intermediaries' claims to authority and competence rest on a precarious balance between integration with and autonomy from the surrounding industry. As Matthews and Smith Maguire argue, intermediaries derive much of their authority from their relative autonomy.[43] They operate in the cultural sphere of indie games, but their status as neither developer nor consumer places them at the boundaries of this sphere, which affords certain kinds of influence. However, autonomy is not a clear-cut value in cultural work,[44] and at the same time they are deeply integrated in the markets, social networks, scenes, communities of practice, and other collectivities without which their work would have no purpose or meaning.[45] Intermediaries must keep these competing values in balance to avoid losing touch with their networks, on the one hand, and becoming absorbed into other people's projects, on the other.

Maintaining this balance is a daily struggle for cultural intermediaries that colors virtually all aspects of their work. In this way, our work suggests that Mark Banks' conception of "negotiated autonomy," wherein cultural producers strive to balance the artistic and the commercial, the ethical and the social, can be extended to cultural intermediaries as well.[46] This balance produces opportunities for cultural intermediaries as they explore the mutable possibilities of connection, as described above, but is also marred by precarity and exploitation.[47] Much like the indie game developers they work with, who strive to remain independent from outside influence even as they are deeply dependent on indie scenes as well as distribution platforms and economic opportunities afforded by interfacing with the "mainstream" game industry, intermediation is a compromised and compromising pursuit.

Cultural intermediary work depends on the ability to purposefully position oneself in relation to various actors and networks while maintaining a degree of autonomy and avoiding

total integration or absorption into other entities. This balancing act of gaining the necessary access to perform intermediation without being reduced to taken-for-granted nodes within larger networks represents an ongoing challenge. For cultural intermediaries, as we will show, this manifests as a constant, dynamic renegotiation of position, connections, and workload. As an ice-breaking activity, at the entrance to the symposium we invited participants to take an instant photo of themselves, paste it on a large sheet of paper, and draw lines indicating personal and professional links between themselves and other participants. The result was a dense, tangled web of nodes and interconnections that exemplified the central role of cultivating and leveraging networks in cultural intermediation. However, despite these dense connections, many of the participants were meeting in person for the first time. Both the strength and precarity of cultural intermediation lie in the management of large, low-intensity networks, and symposium participants repeatedly emphasized the importance of this never-ending task.

The tension between integration and autonomy in cultivating networks is apparent in the way co-working space manager and former event organizer Amir prides himself on his extensive knowledge of people in the industry. During an interview, he displays his high degree of integration by going through the list of symposium attendees and explaining how he has interacted with almost all of them after years of working in the industry. Conversely, Amir notes that he and his fellow participants generally keep one foot outside of the indie scenes and communities they work with, referencing two other attendees across the room:

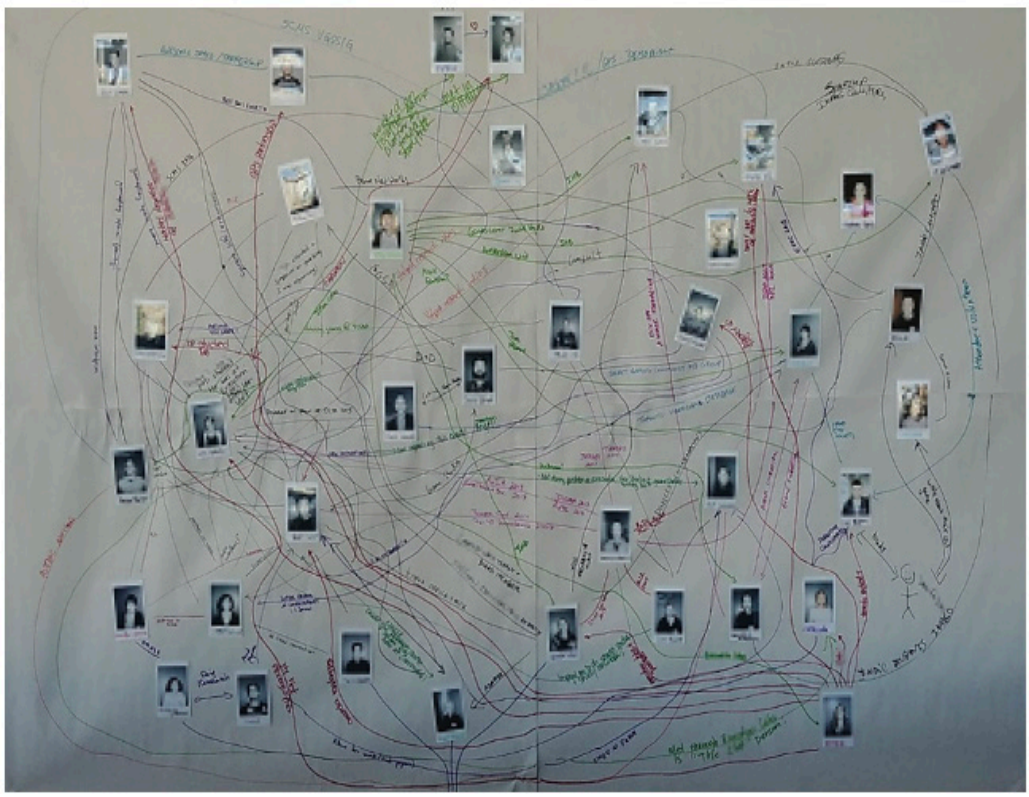

Figure 2. An anonymized photo of our network map, where participants each drew how they were connected to each other professionally and personally.

Photo by Authors.

> You mentioned how I've done many different things, and in some ways Rishi and Keith have the same story. We're all people that have [a lot of] touchpoints, like there was so many different reasons we could have possibly met.

This distinguishes intermediaries from developers and other creative actors who generally remain "inside" specific indie scenes or sectors of the industry, and relative exteriority affords certain advantages. Following Martin Beirne, Matt Jennings, and Stephanie Knight, we suggest this level of integration in a cultural industry, however loose, allows Amir and other cultural intermediaries to maintain a higher degree of resilience in their careers than is common in indie game development.[48]

One prominent indie intermediary and developer, Rishi, mentions in an interview that he has worked hard to establish an extensive network of contacts and relationships in the game industry. This network allows him to bypass certain hurdles and speed up parts of the development process, such as releasing games across multiple platforms and consoles, by calling in favors. He is also part of a network of indie developers that provides assistance to promising indie studios, shepherding them through complicated processes that would be difficult for up-and-coming developers in the industry. All of this is based on building up relationships of trust with a wide range of actors[49] and suturing selected games and developers into as wide a "network of interactions" as possible in hopes of ensuring their success.[50] The lack of formal corporate structures and resources in the indie game space means that these networks are increasingly important. The blurring of boundaries discussed in the previous section comes into play here as well. Rishi notes that he has to keep up with his contacts' birthdays, illnesses, and family news in addition to their game releases in order to keep the valuable relationships going. This no doubt benefits cultural intermediaries and the developers they work with, but at a high cost in terms of their constant "relational labor of connection," which in many cases goes unnoticed and unreciprocated.[51]

As cultural intermediaries take on a prodigious range of tasks, they make themselves indispensable to the people they work with. As a consequence, intermediaries sometimes come to personally embody the spaces, organizations, or networks they maintain. With such a diverse taskscape and lacking a stable professional identity, cultural intermediary work results in a disassociation from traditional organizational frameworks, instead becoming "essential services." Nobody notices these services until they stop working, and likewise intermediaries' professional and personal identities become indistinguishable from the surrounding assemblage. This is particularly apparent in the interactions we observed between managers and coordinators of local game development co-working spaces, who formed a close peer group over the course of the symposium.[52]

For example, Tracey reflected on the differences and similarities between her space and the other co-working directors' spaces. In her view, she essentially *is* the space; without her labor, the space could not function. Until recently, she was a one-woman operation, answering only to a board of directors who did not work in the space or aid in day-to-day work. While her work mainly revolves around the mentorship and support of the studios working in the space, she remains on the outside. Even with the more recent hiring of additional staff, she remarks that her work week will still be over forty hours. Deeply integrated cultural intermediaries in similarly indispensable positions may find difficulty securing new positions in a niche industry if their existing organization disappears. Padma reflects on this difficulty, speaking about the closing of her past organization and how a co-worker is now "lost in the woods." Despite being exemplary at their jobs in terms of networking and brokering relationships between studios, as well as the less visible tasks of intermediation, without the infrastructure of the now-shuttered organization, prospective employers weren't sure how those specialized but wide-ranging skills translate to new scenarios. Cultural intermediaries may find themselves in precarious situations if they are too highly integrated in a specific context while their surrounding networks expand and evolve.

The experiences of these cultural intermediaries clearly show that their work is not only between production and consumption but dispersed across many facets of cultural industries. Following Mark Granovetter's social network theory, cultural intermediaries specialize the administration of weak ties and brokerage across different networks,[53] increasingly enabled by social media platforms.[54] The weak (and arguably shallow) connections Rishi describes can take just as much effort and investment as "strong" ties, and thus are taxing in terms of his involvement in other people's lives and work, but were he not to maintain them it is unlikely he would be able to do the work he needs to do as effectively. By contrast, the ties that Tracey describes are fewer in number, but more personal and demanding to manage, leading to feelings of unappreciation and isolation. Given their greater emphasis on social and cultural capital and legitimacy compared with corporate AAA game development, working in indie game scenes necessitates navigation between these two poles. Herein lies the difficulty: Cultural intermediaries work to resist the pull of any one specific network, institution, or project, because it could negate their intermediary position and endanger their effort to maintain a widespread network (resulting in an ever-smaller number of stronger ties). At the same time, it is fruitful to be well integrated in specific networks and institutions, because those stronger ties can yield greater resources. The resilience (or lack thereof) in cultural intermediation lies in this balancing act.[55]

Conclusion

As Matthews and Smith Maguire suggest, "cultural intermediaries serve as an empirically grounded point of entry to highly complex political, economic and cultural processes."[56] The findings and anecdotes presented in this article demonstrate that cultural intermediary work is both broader and deeper than commonly understood. By putting our participants in the same room and encouraging them to reflect on these questions, we have been able to affirm intermediation as a distinct category of cultural work that is central, not peripheral, to indie game development and which goes well beyond traditional notions of gatekeeping and tastemaking. Far from simplistically re-presenting cultural objects to interested audiences as in linear "transmission" models of culture,[57] indie intermediaries engage in a whole host of networking, brokerage, translation, care, and support activities that impact all aspects of game production, distribution, and reception. In discussing their blurry professional and personal lives, intermediaries return frequently to concerns about how autonomous or integrated they are in relation to other actors and networks, resonating with the more general fixation on autonomy and cooptation in independent cultural production.[58]

These tensions for cultural intermediaries are ultimately "bound up as part of the complexity of their work," which is difficult to capture in abstract theorizing.[59] By engaging directly with on-the-ground cultural workers, we are able to offer an empirical perspective on these questions. Rather than positing "indie intermediaries" as a fixed role or position, we see here a "distributed, crowded network of intermediaries,"[60] ranging from small-scale and individual actors to sizable operations, all of whom move strategically through and between other actors and entities in the game industry, maintaining claims to specialized knowledge of different aspects of indie game development, and undertaking diverse and shifting taskscapes in order to accomplish their equally diverse and shifting social, cultural, and economic goals. In doing so, indie intermediaries must constantly balance their autonomy as third-party actors with their integration into the communities they service and the larger, institutional structures of the game industry they navigate. By drawing attention to the wide variety of tasks and underlying tensions involved, we hope to satisfy McFall's imperative to avoid getting "carried away with all that symbolism, signification, and taste-making at the expense of the more mundane work,"[61] as well as Mark Deuze's call for "a renewed focus on the social, communal, and collaborative aspects of contemporary cultural work."[62] The work of cultural intermediaries is neither straightforward nor glamorous nor lucrative and is often laced with ambivalence and uncertainty, but as our participant Lee proudly declares, it is the oil that keeps the engine of independent cultural production in motion.

CHAPTER 33

Seeking Deep Relations in a Precarious Industry: Addressing Mental Health through Independent Videogame Development

Paolo Ruffino

Television & New Media 23, no. 7 (2022): 761–76. https://doi.org/10.1177/15274764211025623.

Abstract

Anxiety, depression, burnout and impostor syndrome are frequently reported among those who work in the videogame industry, and are exacerbated among independents and freelancers. The article draws on interviews with four London-based independent videogame developers who have engaged with the production of videogames about mental health. The article argues that conceiving, producing and releasing these games is understood by their makers as a strategy to establish relations with consumers, participants and other developers that could break the invisible barriers that prevent dialogs around mental wellness. More than being concerned with the outcome of their work or its commercial success, developers seek relations with other game workers and players through the process of making, researching, testing, and showing their videogames. The development of videogames about mental health is interpreted by the participants as facilitating exchanges of autobiographical experiences that are otherwise regulated by the norms of professional networking.

Keywords

independent videogames, mental health, videogame development, videogame industry, deep games, network sociality

Deep Relations in a Precarious Industry

As demonstrated in previous research and reports, workers of the videogame industry experience conditions of precariousness and competitiveness that often lead to or exacerbate pre-existing mental health conditions such as anxiety, depression, burnout and impostor syndrome (Bulut 2020; Kerr 2017). The article looks into the current trend of making videogames about mental health and investigates, through interviews with four London-based independent developers, how this choice is motivated. It argues that developers identify in this strategy the potential to establish connections with other developers and players and open a dialog on their conditions of work. More than the commercial success of their game, they are interested in the conversations that happen while conducting research for their game, while talking with other developers in co-working spaces and with players at festivals and through the testing stage. While acknowledging that the efficacy of this strategy could hardly be evaluated in the short term, the article observes that game workers identify strategies to cope with and potentially resolve their conditions even when social barriers make them appear insurmountable and unspeakable. Listening to their motivations sheds light on the strategies adopted to tackle issues deriving from isolation, and from myths of meritocracy and entrepreneurship that pervade the videogame industry. The study also emphasizes the importance of spaces of physical co-presence as facilitating intimate dialogs: an opportunity that is currently affected by the social distancing measures imposed by the COVID-19 pandemic.

Interviewees refer to their projects as deep games, a categorization that is gaining popularity in videogame development. The term is used in this article to refer to a broad category of videogames that try to make sense of human experience, address the complexity of personal and social lives, aim to represent emotions, psychological traumas, abstract concepts and habits of thought, and make these playable (Freeplay Independent Games Festival 2019; Rusch 2017). The definition of a deep game is partial and limited, and this article is mostly concerned with the popularity and use of such a categorization, rather than its specificity. The label is used by a number of designers and authors and refers to interactive texts that draw on an established tradition of autobiographical game design, originating from independent videogame development and the "queer games avant-garde" (Anthropy 2012; Ruberg 2019a, 2019b, 2020). Recent productions and the introduction in 2017 of the BAFTA award category "Game Beyond Entertainment" demonstrate attention among videogame developers toward introspection, social relations, and the difficulties of understanding and speaking about one's own inner psychological states.

The research supporting this article started by exploring the motivations that bring independent developers to approach mental health as a theme in their videogames. It concludes that mental health is mobilized strategically by the interviewees to address the conditions of productions of independent videogames. In so doing, interviewees develop their autobio-

graphical self-reflexivity by connecting their work with their personal life stories, and as part of the same gesture think of their work as instrumental to enable new and *deeper* relations with others.

The attention toward the representation of mental health in videogames is becoming prominent at a time when it is explicitly discussed among groups and associations representing workers of the videogame industry. At the Game Developers Conference 2020 the association Take This revealed that at least 50% of workers in the sector experience psychological burnout in their careers, according to their survey (Take This 2020). The UK Games Industry Census published in February 2020 discovered that 31% of respondents suffered anxiety and depression, compared to the national average of 17% (Taylor 2020, 48–52). The causes are identified in the instability of these professions, frequent forms of harassment and microaggression, and stories of unfair treatment on the workplace. The lack of diversity in the field (still predominantly white and male) causes those who do not belong to the dominant gender, race and class to keep silent about these issues, which further impacts on their mental wellness. The videogame industry has been traditionally adopting practices such as "crunching," working over sixty hours per week in the months preceding the release of a title: a result of poor management which is often interpreted as a rite of passage, a proof of being committed to the job (Dyer-Witheford and De Peuter 2009; Woodcock 2019). Take This (2020) reveal that, on average, an employee changes 2.2 employers every five years, a tendency that leads to the absence of mentoring for new hires, and makes it unlikely for a worker to stay long enough in the same company to change its internal social dynamics.

Interviewees involved in this article admit having switched to an independent career after experiencing forms of harassment and unfair treatment in a videogame company, and realizing it would have been easier to leave than to propose structural changes. Job insecurity brings to an ongoing process of self-branding and self-marketing on social media which, in its own turn, causes feelings of inadequacy and impostor syndrome when career updates are not as frequent as it would be expected (Arvidsson et al. 2016; Gregg 2011). Achievements and skills are constantly scrutinized, in a labor context where completed projects are "badges of honor" and inseparable from the worker's identity (Deuze et al. 2007). Those who are struggling psychologically feel that they must suffer in silence due to the social stigma that perceives disclosure of emotional difficulty or distress as a sign of weakness or inadequacy (O'Donnell 2014). The shame and fear of judgment isolates individuals who are suffering and prevents them from getting help when they need it most. This can further exacerbate the challenges facing the mental health and wellbeing of game workers. These conditions are thought to impact those working independently more than employed workers, due to the pressure to self-promote on social media and to network (Browne and Whitson 2021; Tyni 2020).

This article draws on the analysis of a series of semi-structured interviews with four independent London-based videogame developers who have been designing games about mental health. In the initial stage, in early 2020, the research was motivated by finding out more about the objectives and motivations of the developers and their interests toward deep games, at a time when discourses surrounding mental health were becoming prominent in the videogame industry and society at large. Interviewees have been asked about the reasons that brought them to develop a videogame on mental health, their goals, and their perception of how mental health issues are treated in our contemporary society and in the industry.

Each participant has been interviewed separately, and their answers were color-coded by the researcher to identity recurring topics, arguments, lexical choices. The first round of interviews highlighted three trends: (1) frequent references to the developers' biographical narratives; (2) comments on how videogame development could either enable or deny agency over one's own life; (3) motivation to establish meaningful relationships with other human beings through the development process. Other topics, such as the content of the games or their commercial feasibility, were less prominent than what was initially expected. Participants have been invited to a follow-up interview to expand the three main areas of analysis. The results feed into the findings of this article, organized around the three key areas: biographies, agency, and relations. Participants were also invited to comment on a draft of the article in a third and final stage, a process that gave them the opportunity to reflect on the argumentation, suggest changes, and read each other's comments. All interviewees have agreed to appear with their full names and including references to their work, personal life stories and connections with mental health. They have been made aware of the option to remain anonymous and of the potential risks involved, but have preferred to appear publicly. Their choice has not been further discussed, but it is likely to be due to the fact that their work and opinions on the subject have already been publicized through their accounts on social media or in other public contexts.

Research started at the beginning of the COVID-19 pandemic and has been conducted mostly online. It has been facilitated by previous contacts established in the area of London, where the researcher is established. London is a geographic location with a significant presence of videogame companies and independents (UKIE 2017). The number of graduates who aspire to an independent gaming career grows year-on-year due to the high number of universities offering degrees in game development across the UK (Harvey 2019). Many of those graduates who drop out of roles in larger companies hope to take closer control of the content and pace of their work by becoming self-employed. The significant presence of independent creatives has traditionally made London a privileged case of study to evaluate the effects of the neoliberal politics of labor, where work is increasingly "impermanent, short-term, project-based," "passionate," and deprived of welfare and social security (McRobbie 2016, 33–59). Within these conditions, the union organizing project Game Workers Unite found a fertile ground in London and across the UK in 2018, demonstrating that interventions of collective solidarity and support among workers in the UK game industry might be gaining popularity (Ruffino and Woodcock 2020). The four interviewees involved in this study are enmeshed in the cultural and economic context of the UK capital, each showing a high level of awareness of the difficulty and competitiveness of their job, and being particularly receptive toward unionization and collective organizing.

The article concludes that working at deep videogames is seen by the interviewees as a strategy to establish new, different, and more meaningful relations, in an industry that has problematized relations in the first place. The hyper-individualism and competitiveness of this context turn both friends and colleagues into "contacts," toward which one needs to carefully consider whether to disclose feelings of mistrust and uneasiness in relation to their careers (McRobbie 2016, 17–32; Wittel 2001). Designing deep games about mental health is seen as a strategy to bring into play an internal state that is made invisible by work relations, and legitimizing talking about mental health. The deep relations that the interviewees aim

to establish through the development of their games are intended to reach consumers, other developers, and even those involved in the production process as co-workers and participants, with the objective of initiating a dialog that breaks the barrier of secrecy. From this perspective, the content of the games becomes less important. This becomes evident in the accounts of two interviewees who have been designing games on Alzheimer and Asperger syndromes, which are not directly caused by working conditions, but are discussed by the interviewees as enabling conversations about their own work.

Mental Health and Independence: An Industry of Biographies

The videogame industry and the culture surrounding it have often sought to imitate the focus of the film and music industries on the figure of the auteur (Caldwell 2008; Dovey and Kennedy 2006; Mayer et al. 2009). The notion of independent labor in videogame culture has been framed to a significant extent on the myth of the solitary author. There is a long history of self-releasing videogames without the backing of a publisher, producer or investor (Indiecade 2014; Nooney 2014). However, in the late 2000s and early 2010s the aspiration of working independently at a videogame became more prominent in Western economies, and intersected with the availability of online distribution platforms, crowdfunding, and freely available tools of production. In the United Kingdom the effects of this technological and social imaginary are particularly visible. According to the innovation agency NESTA (2014), up to 95% of the workforce in the videogame sector in the UK is employed in small or micro-companies, and is often self-funding their initiative (p. 16). Working individually at a videogame is not a new practice, but it is now becoming the standard for videogame developers, at least at some stage in their careers (Vanderhoef 2020).

Drawing on the vision that sees developers as auteurs, independents are expected to promote themselves on social media and are considered responsible for their attitudes toward the public, their choices in the production of games, and even in their habits of cultural consumption. Biographical reflexivity is brought forward in independent game development, and various strategies are enacted in the process of branding oneself as part of a design aesthetic. As already noted by Beck (1992) in his study of "risk societies," individuals "become the agents of their educational and market-mediated subsistence and the related life planning and organization. Biography itself is acquiring a reflexive project" (p. 90). Biographies are mobilized when justifying one's own presence in the industry and networking with potential collaborators and consumers. As a result, social media such as Twitter become the ideal context where to engage with audiences and collaborators while constructing a biographical narrative framed around passion toward videogames.

However, the narratives of individualization often overlook the standardization and adaptation that the independent developer must undergo in the process of becoming publicly visible. An aspiring independent developer must comply with the entrepreneurial and neoliberal practices that determine the existence and survival of their job. In this process, the independent videogame developer is expected to frame their passion toward work through a "moral calculus," where vocational and profit-driven labor must be rightly balanced (Chia 2019). The independent developer is dependent on the labor market, which, despite claims of it being unregulated and open to all, presents a certain set of rules of engagement: it

becomes necessary to comply with the rules of the cultural intermediaries, of social media and other contexts of PR and marketing, and appear in first person at multiple publicity, promotion, and networking events (Parker et al. 2017). These tasks demand time and effort, especially since the support originally provided by the professional figure of the producer has been eliminated in independent careers (Whitson et al. 2018). The cultural labor of the independent developer is often invisible, deprived of mentoring schemes or clear patterns of progression, characterized by long working hours spent on networking and fundraising. Independent developers have marginal agency when it comes to deciding whether, and how, they are going to appear to players, other indies, and the general public. Yet, they need to be prepared to take all the responsibility for their products, public actions, and statements.

It is within this context that independent gaming and its failures are discussed as individual affairs. These failures typically give rise to social, psychological, and emotional crises, and frequently force independent developers to abandon their projects, social media presence, or, in some cases, even their careers. The dynamics of distribution and marketization of videogame products give rise to the praising and shaming of specific individuals, while treating each story as a separate case, attributable to the (successful or otherwise) life choices of a single person. Narratives of independent failures replicate the same terms and criteria that are used in instructing and directing developers toward a career in gaming. Learning to be a successful indie developer is often presented as a process of self-discovery and production of potential, consistently with the "turn to passion" of career guides and coaching in other creative sectors (Hong 2015; Mäkinen 2016). Contexts of mentoring and education—such as the workshops and how-to guides orientated to aspiring independent developers—are articulated as a series of practical suggestions as to how to change one's own life in order to make it as an independent developer. These suggestions often involve making the right life choices: how to manage one's personal and family finances; which habits of consumption to take or give up; who to talk to and meet up with to create a solid professional network; which costs and economic factors to consider when choosing a place to live, and so on. The road to success is allegedly made up of personal life choices, which implicitly suggest that failure is the result of not having managed to live well enough.

Similar trends are evident across the creative industries. Economies of precarious employment tend to celebrate stories of self-made success, especially on social media (Duffy et al. 2019). In these contexts mental health is often influenced by an individualized and gendered narrative of competitiveness and meritocracy (Franssen 2019). Videogame culture has been adapting the concept of the ideal worker to that of the gamer: an obsessive, addicted, competitive consumer. An ideal consumer that has been, in its own turn, normalized by videogame press across the 1980s (Kirkpatrick 2014). These cultural imaginaries frame a context where syndromes and disorders might be seen favorably, as signs of dedication and commitment. A number of associations are campaigning for mental health awareness in the videogame industry. On top of the aforementioned Take This, the charity Safe in Our World was founded in the UK in 2019 to foster positive mental wellness for "players, developers, publishers and retailers" (Safe in Our World 2020). The UK charity GamesAid (2020) has organized special game jam events and published articles on mental health.

The dynamics surrounding the acts of blaming and praising a specific individual are specific to the contemporary modalities in which videogames are made, distributed, and consumed,

and intersect with the economic and cultural promises that have been made regarding the emergence of independent forms of videogame development over the last ten to fifteen years (Crogan 2018; Martin et al. 2009). This modality of labor is characterized by systemic contradictions that promise personal emancipation, creative control, and economic success, while simultaneously rendering these almost entirely unachievable (Bulut 2020). In response to this new condition only biographical strategies appear to be possible: techniques of self-management, ways of relating to one's own friends, followers, and professional contacts. In this view, suffering from depression, anxiety and burnout become personal deficiencies, rather than embodied responses to the specific occupational stressors and systemic biases of the work environment and culture. At the same time, the pressures of creative labor are made to appear as transcendental obstacles to circumnavigate in isolation, rather than as the result of contingent choices that could be challenged by collective action.

Within this context, developers identify strategies to address a systemic and structural problem of their work. These strategies are not necessarily to be evaluated for what they are achieving, but as signs of what is interpreted as a viable response to an otherwise suffocating condition. Making deep games, as the following section will argue, is seen by the developers as a personal solution to tackle their anxieties and fears. Ultimately, the purpose of their project consists in establishing relations with others from where the (in)visibility of mental health can be addressed, and possibly dealt with, as a systemic issue of the videogame industry.

Interviewees

The research has involved four independent game developers. Marina Diez is CEO of Three of Cups, and at the time when she was interviewed she had released I'm sorry (2020), a game about over-apologizing, made for the GamesAid Mental Health Game Jam 2020. In 2019 she has designed and released PTSD, a game about post-traumatic stress disorder; I'm New Here, about introversion and learning how to take care of oneself; Consent, Empathy and Intimacy, each game addressing the implications of feelings and attitudes toward others. Federico Fasce is a game designer, lecturer at Goldsmiths, University of London, and co-founder of Game Happens, an association that organizes events for independent developers in Italy. Federico had released The Ballad of Past Lou (2020) at the time of the interview, an autobiographical and playable reflection on emotional distress and forgiving. Xu He is a game designer with a record of academic publications in psychology. She has designed and developed Happy Land (2018), a VR game about the difficulty of communicating sadness, and Disconnected (2019), a game that makes players experience the life of an autistic girl, involving interviews with participants. Tim Kaufmann has been working at the game Misfolded as lead designer and developer. Misfolded is a game about melancholy and forgetting, based on Tim's research on Alzheimer as a neuro-scientist. Tim has also designed Don't Blame Baby (2017), a VR game about passive aggressive relations in domestic environments, and The Prisoner (2018), a game about the passing of time for a prisoner serving a life sentence.

Biographies

Each participant connects their work to their life experiences, finding in their personal biographies a justification for the videogames they are making. Marina recalls starting her career as designer with Hey Dad (2018), a game based on memories of her father at the time he was diagnosed with bipolar disorder: "I made my first game, Hey Dad, based on my experience. My father was diagnosed when I was a child." The design process "helped making connections and looking at things differently." The work prepared the ground for PTSD (2019). Marina admits suffering from post-traumatic stress disorder. She believes that making a game about her own life experience had a therapeutic effect on her: "it has been of great help, it was difficult because these are personal issues and are hard to think through the design of a game, but it helped me making new connections and made me think a lot." Federico looks at The Ballad of Past Lou as a reflection on his life around 2016, when he moved to London from Italy and started a new life having only a few contacts. Federico defines this process as a traumatic experience that involved his work and life to the same extent:

> "I had to make decisions on how to present myself to game companies, and who I was as a person. What I want to do, what I want to talk about. I had never been in psychotherapy but I started, at that time, getting in touch with a professional through Skype. [. . .] At a point I decided I would make games in two to three weeks max. That would allow me to finish what I started and focus on a skill that I wanted to improve. It had a therapeutic effect on me."

The Ballad of Past Lou, a relatively short game, is seen by Federico as a result of such process of autobiographical reflection.

Xu He and Tim have a background in academic research around cognitive neuroscience. Xu He realized she had been suffering from Asperger syndrome while researching the subject. Such a realization, which "explains a lot about my life" as she says, is made playable through Disconnected. She observes: "I read articles on Asperger and realized that I am on the spectrum. I realized that there are a lot of people who never get diagnosed. And I thought I could make a game about it." Tim has been researching Alzheimer as neuroscientist. He has looked into this syndrome because his grandfather suffered from it. Reading about Alzheimer and its effects helped him making sense of his memories and of the experiences of his parents while taking care of Tim's grandfather. Tim defines his decision to make a videogame about Alzheimer around the desire to make the syndrome playable and understandable to others, and as part of a process of self-discovery: "I first worried about how much research I could illustrate into the game [. . .] but talked with people who went through something similar and understood that the emotional journey and understanding the story behind is the most important part."

The motivations for each interviewee are presented as being deeply entangled with personal cases and memories of family members. Deep games are for them a way of processing their life stories and make them accessible to others, an aspiration to construct and re-embed their biographies within a network sociality. As argued by Wittel (2001), networking does not necessarily amount to the formation of social groupings, shared narratives, and values; rather, it is made up of a "multitude of experiences and biographies" (p. 65). However, on this occasion the connection between work and biography made by the interviewees is mobilized to create the conditions for mutual understanding and collective strategies. In this sense it

has a double function: first, to re-claim a form of agency in a context of labor that has largely overlooked the psychological and physical needs of the individual and, secondly, establish relations with others where invisible mental states, such as mental disorders and syndromes, could be addressed.

Agency

The games made by the interviewees are presented through an autobiographical narrative which opens to a redefinition of their own agency on at least two levels and meanings. First, agency is re-claimed by the designers in relation to the problems of the videogame industry. Mental health in the industry is perceived as an issue by the participants, affecting those working at large companies as much as the independents. This is often reconnected to personal experiences and many "heard of" stories of colleagues being subject of abuse, unfair treatment, prolonged working sessions, eventually leading to stress, burnout, and impostor syndrome. Making deep games is a strategy to identify areas of intervention within the industry and to reclaim agency over a social and economic condition that has eroded the possibility for change.

Secondly, videogames are frequently defined by the participants as ideal tools for understanding psychological states. The interactive and iterative experience of playing a videogame requires one to perform similar actions over time and, according to the participants, be confronted with a simulation of the hurdles of those who are suffering from mental health issues. Making the player "step into the shoes" of the affected patient is a common approach in deep games, and is largely inspired by theories on the effects of representation and simulation that have been at foundation of the early studies on digital games (Frasca 2003). As the interviewees often put it, it is a strategy that gives power to both the designer and player in a context, that of mental health, defined by powerlessness and difficulty of communication.

Marina identifies the four most common mental problems of the game industry in "anxiety, depression, burnout, and post-traumatic stress disorder." The same issues that brought her to make a game such as PTSD, and made her decide to work as an independent. Making interactive games can "show these personal experiences" in a unique and effective manner, she claims, and can be used to address issues that are frequently seen in the workplace. Videogame companies are defined by Marina as being over-competitive, and characterized by low levels of empathy and tolerance for those who claim to have mental or physical problems. Thus, making videogames about these issues is seen as the ideal strategy to "normalize mental health," as she says, and change the industry from within.

Federico explicitly connects the potential of videogames with the lack of control on mental safety in the workplace. He says that, at the time when the company he was working for gave him a temporary contract, he experienced anxieties that he would then communicate through his games: "I started using games as an expressive tool, a way of challenging my emotions and fears. Making videogames became for me a way to unpack certain feelings and think through them in a familiar language." Attending game industry events such as the Game Developers Conference, and engaging with other developers at the Game Happens festival in Italy, made him realize that many want to talk about these issues. There are structural problems in the industry that make these forms of intervention nearly impossible, Federico admits, saying that "it is certainly a cultural problem [and] a problem of management" and that there is a pressure

to "sacrifice your private life to make games." Moreover, many cannot even recognize when they are experiencing mental health issues. Making deep games is then defined by Federico as "a therapeutic process, which takes out of you things that are deeply personal and makes you challenge them." He also says that "initially there is fear, it takes effort to make the first step. It took me three months to decide I really wanted to go through that path." The process then creates "a channel of communication with others because others have the same experiences, and the process gets you closer to them."

Tim's account maintains that mental health issues are often invisible, or made invisible, by those working in the videogame industry. He recognizes that in the development of Misfolded some of his collaborators started experiencing anxieties and stress as a consequence of the pressure to complete the whole project within eight months. Collaboration in the team was immediately affected, but Tim remembers being capable to identify these issues when they happened: "I've seen it before and I said I need to recover before it gets worse, I was lucky enough to spot it. A lot of people in the development team didn't spot it, and this led to burnout and physical problems, because they are connected." The invisibility of the degradation of mental health is perceived as a complex area where to intervene, or even talk about. It is also entangled with the myth that working in the game industry is "passion labor." As Tim says: "people are passionate about the work they are doing because it's part of themselves [. . .] and suddenly their self-worth is tied to the work they are doing and if that is not good enough than it's them who are not good enough and that starts to spiral and it becomes all consuming."

At the same time, videogames are perceived as enabling that intervention. Xu He claims that in games "there is more control, it is more than just animation" and that "we can use the power of games to do positive things and make people understand mental illness better." Asperger is invisible, Xu He observes, and even "watching a film about it might not reveal its implications or enable spectators to recognize its effects." Videogames, instead, "drag the player into the characters [and] make people feel the frustration." However, to make those games is extremely demanding for a developer. "When I worked for a company I had no spare time to make (my) game" Xu He admits, and claims that to experiment she "needs funding, and I can't get funding easily." Marina further acknowledges that making deep games can, in its own turn, exacerbate stress and burnout as these productions are not at all deprived of deadlines or external pressures.

The accounts of the interviewees reflect on their practices and experiences by identifying two areas where control becomes problematic. It is difficult to understand, recognize, and talk about mental health issues, particularly within the videogame industry where labor is perceived as being purely driven by passion. Also, videogames make the player experience varied degrees of control over the simulation. Deep games are then seen as texts through which agency could be re-claimed, even if temporarily and partially, in a way that could enable both players and designers to understand those unspeakable, and unspoken, internal states.

Relations

Working with videogames often brings to physical and mental issues, but videogames are also seen as enabling a process of self-discovery that paves the way for a safer and healthier
